or more ruffians generally join in the attack. The roughs appear to be by no means anxious to encounter each other, and prefer to exercise their brutality on some inoffensive and helpless person. In reading of these continual outbreaks of savage passion and cruelty, we seem to be taken into the company of wild beasts. It is impossible to disguise the fact that the progress which has been made in education and the outward forms of civilization has left quite untouched the residuum of primitive barbarism at the bottom of society. It is significant that this outbreak of ruffianism has taken place chiefly in the iron and coal districts, where working-men have for some time been enjoying better wages and reduced hours of labour. The consequence is that they have had more money to spend in drink and more time for murdering their wives with clogs and poker. Nothing could be more unjust than to fasten upon the working classes as a body the vices and crimes which belong only to a section of them; but at the same time there is no getting rid of such painful and disgraceful facts as are continually being brought out in the police and other criminal courts: and it is undeniable in the face of this evidence that there is a deeply-rooted spirit of brutality among the lower classes of the population. It is only the worst cases which come before the magistrates and get into the papers, but behind these lies a vast amount of obscure ferocity and violence, which cannot fail to have the most baneful effect on those who are exposed to its influence. There is no other country in the world with any pretensions to civilization where such scenes are enacted as are daily reported from Liverpool, Oldham, Preston, Birmingham, Dudley, Hensley, and similar places. The American bowie-knife and revolver and the Italian stiletto are bad enough in their way, and yet they are less horrible than the stolid, systematic, everyday kicking to death which appears to be kept up all the year round in Lancashire and the Black Country. It is obvious that these atrocities are not only a national disgrace, but a grave social danger which cannot with impunity be left unchecked. There is nothing which has such a tendency to develop and spread as this spirit of reckless violence and lawlessness; and there can be no question that its present prevalence is due in a great degree to its having been so long allowed to take its own course without any serious attempt having been made to repress it. There has evidently been either a discreditable timidity or an irrational tenderness on the part of magistrates in dealing with offences of this character. Unfortunately, too, the tone of some of our public men in recent years has afforded a dangerous encouragement to defiance of law and order. The other day a balloon which was advertised to go up at Northampton did not go up for want of gas, and the spectators thought themselves at liberty to tear the balloon to tatters, which after all was only an imitation of the sort of tactics for which Mr. Beales was made a judge. The immoral and demoralizing flattery which has been bestowed on the working classes may also be supposed to have had its effect, and it can hardly be wondered at if a section of the most ignorant and brutal part of the population has arrived at the conclusion that law-makers and magistrates are alike rather afraid of it, and that it can indulge its ruffian instincts with impunity.

It is quite clear that this state of things cannot be allowed to continue, and that it is to be met only by stringent measures. The maximum punishment which a magistrate is entitled to inflict on a man for assaulting his wife is six months' imprisonment with hard labour, and this is obviously a very inadequate punishment for what is really attempted murder. The brute who knocks his wife down with a poker, and then dances upon her with iron-shod clogs, is perfectly aware that the injuries he is inflicting may result in death, but he is bent upon gratifying his wild-beast temper, and is indifferent to the consequences. The usual argument for leniency in such cases is that it is impossible to punish the man without at the same time punishing his wife and family, who are dependent on him for subsistence, and who will be left to starve while he is in prison. It is also said that, if the man is hardly dealt with, he will take his revenge on the woman when he comes out of gaol. There is no doubt some truth in this line of reasoning, but it is obvious that it unduly narrows the question, for the rough does not exclusively confine his attentions to his wife. It is necessary that this sort of brutality should be put down, not merely for the sake of those who actually suffer from it, but for the sake of those who may suffer from it, and in the interest of the community generally. The principle to start from is that the punishment of such offences should be such as to deter people from committing them, and it is perfectly evident that the present scale of punishments does not produce this deterring effect. Experience has shown the extremely salutary influence of flogging in checking a kindred class of crimes—robbery with violence: and there can be very little doubt that the rough who beats his wife and attacks inoffensive persons in the streets is likely to be very much daunted by the prospect of the lash. There is no reason why attempts at murder should not be punished by hanging, except that it is desirable to give the assailant an inducement not quite to kill his victim; but, short of hanging, the punishment should be made as severe as possible. Imprisonment by itself is clearly ineffectual, and though education may in the long run produce a favourable effect, the process will necessarily be slow, and something must be done in the meantime to repress the shocking outrages which are continually occurring. There can be very little doubt that what is wanted is a periodical flogging—say, once a fortnight—in addition to imprisonment and hard labour.

FARMERS AND ARTISANS IN MASSACHUSETTS.

TO the political student an inquiry into the social condition of Massachusetts has many strong attractions. The State was one of the first settled upon the American continent, and society consequently has there had time to develop some at least of the tendencies which are inherent in the new conditions under which it has been placed. Moreover, the State was settled by God-fearing, earnest, industrious men and women, who desired to make the most of this world while preparing for the next, and whose characters afforded security for both order and stability. These people brought with them strong and decided views in politics as well as religion. They had left their own country chiefly to escape the tyranny of king and priest, and in their new homes they were allowed full liberty to work out their ideas. Under the Commonwealth the rulers of England were kindred spirits, and after the Restoration the Government cared little to meddle with the obscure sectaries of New England. Further, the peculiar notions of the settlers led early to the general establishment of common schools, and thus Massachusetts gained a long start of European countries in respect to popular instruction. Again, although the power of England ensured her colonists against foreign conquest, the presence of Indians and of Dutch and French settlers in their neighbourhood for a long time rendered military discipline and the use of arms compulsory; while the absence of all cause for apprehension from abroad for nearly a century now has allowed wealth to accumulate, and thus has given rise to a very considerable and very varied industry. The port of Boston is one of the most important in the Union, while the textile manufactures of Massachusetts are superior to those of any other State. For these and other reasons which might be mentioned, it would be impossible to select a more favourable field for testing that peculiar form of the democratic experiment which is being worked out in the United States. The only adverse circumstance indeed that can plausibly be alleged is the physical character of the Commonwealth: its rugged, stony, and infertile soil, and its rude climate, with its long winter and short summer. But the physical character of Scotland is not very different, and Scotland certainly is not the least favourable specimen of a European country. Singularly enough, close as is the communication between the two countries, our ideas regarding the social condition of the United States are extremely vague. Owing partly to the Civil War and partly to the long discussion relative to the *Alabama* Claims, our attention has been directed to their political condition, and the result of our increased knowledge is to be seen in the cessation of the practice, once so freely indulged in by a certain class of politicians, of pointing across the Atlantic for examples in government and legislation. But, in regard to social condition, our knowledge is still strangely defective. As throwing very full light upon this point, we propose to examine at some length the two official reports of Massachusetts State Boards (the Board of Health and the Bureau of Statistics of Labour) which we briefly noticed in a recent number.

In all countries the most influential and most characteristic class is the landed proprietors, and nowhere is this class more important than in the United States, as it is they who in the last resort determine the policy of the country in all really great matters. In Massachusetts this powerful class comprises 39,766 persons out of a total population of 1,457,351; or, to put the facts in a way that will more clearly convey the importance of the class, it comprises one-eighth of all the persons engaged in any kind of occupation in the State, and one-sixteenth of all the persons over ten years of age. Among ourselves we have obviously no body of men to compare with them. For their like in Europe we should have to go to France or some other Continental nation. We need hardly tell our readers that, as in France, the owners are also cultivators of their lands, with exceptions so few as to be undeserving of notice. But, unlike the French *peasants*, the Massachusetts farmers hold land enough to allow of scientific farming. According to the Census of 1870 the average size of farms throughout the State is 103 acres; in our own country, as we learn from the Agricultural Returns for 1873, the average size of farms is only 56 acres. The comparison here instituted would, however, be deceptive without the explanation that the English average represents a mean struck between holdings varying from very large to very small, whereas the Massachusetts average approximates to the usual size, the actual farms neither greatly exceeding nor greatly falling short, though still, of course, there is nothing like uniformity. Another point to be noted is that the Massachusetts farmers are the most American of any class in the State, 92 per cent. of them being native born; the remainder consisting chiefly of Irishmen, the English and German together being only about one-fourth of the Irish. Lastly, the presence of flourishing industries in the State and the neighbourhood of large towns afford a ready and easily accessible market for the produce of the farm. It would seem, then, that the lot of this territorial democracy, to use Mr. Disraeli's phrase, ought to be as happy as any the world can show. As a matter of fact, however, it appears to be far otherwise. The State Board of Health last year addressed inquiries to a number of medical men practising in the agricultural districts with reference to the health of the farmers and the causes affecting it, and it also obtained information from non-professional persons likely to be acquainted with the subject. The result of this investigation is included as a separate paper in one of the Reports of the Board, and the impression left by its perusal upon our minds is that the farmers are not prosperous, their homes not happy, and their families

not contested. As was to have been expected, there is a wide divergence of opinion on these points among the correspondents of the Board. One, a politician writing from Concord, Mr. Emerson's native town, speaks of a farmers' club whose members are capable of writing essays worthy of publication, and who enjoy all the comforts of life. On the other hand, a clergyman declares that farming does not pay, and the doctors generally paint the farmer's life in anything but rosy colours. Some describe him as too lazy to hurt himself by work, others as too stupid to be fit for anything else, and some as too anxious and worried to be either healthy or happy. But the majority declare him to be overworked, and very many add that he is underfed. The author of the Report ventures no further than to say that the farmers of Massachusetts are more prosperous than those of the Western States. But, as the Western farmers are just now in combination against the railways on the ground that they are sinking irretrievably into debt through the high fares charged for the carriage of goods, that is evidently not saying very much.

Leaving opinions and coming to facts, we find from the Census that the number of farmers in the State decreased nearly one-ninth between 1860 and 1870, while the population of the towns increased 100 per cent., and it is admitted by the Health Report that the children of the farmers escape to the cities at the earliest opportunity. For example, one doctor writes:—"I think the longevity of farmers' families below the medium. The children, as a rule, are expected to work beyond their strength, the exposure they are subjected to sows the seed of future disease, and unfits them for the change of habits and of life generally that many young people make when they leave the homestead for new work, as the majority of them are inclined to do as soon as they are at liberty." Partly from poverty and partly from thrift, the farmers are reluctant to engage sufficient labour, and consequently overwork themselves and their children. But it is the wives of the farmers whose lot appears to be by far the hardest. Thus we read:—"Farmers' wives work too hard for health. Help is scarce, and the mother, with her household cares, want of sufficient sleep (especially when she has small children), and her responsibility as the lady of the house, bears too heavy a burden." Again:—"Wives, especially during pregnancy and lactation, suffer very much. They are often worn out by suckling and work at the same time." And again:—"There is a general want of constitutional vigour among the families and children of the New England stock at the present day which is sad to contemplate. It will lead to the extinction of the race here in New England, at no distant day, if not counteracted. In almost seventy-five years of observation, it is to me a marked and mournful fact." Another point much insisted upon by the medical correspondents of the Board is the bad quality of the farmer's food and its equally bad cooking. For instance:—"Improper and badly cooked food, yes. Among the poorer classes, too much vegetable to the exclusion of meat diets; the latter of poor quality." Another writes:—"The bread is generally poor, heavy, and sour, often made with cream-tartar and saleratus or soda." And another:—"Would suggest the abstinence from pork and salt meats, at least in summer, with the use of fresh meat, milk, a variety of vegetables and fruit, and sweet wheaten bread. Above all, a reversal of the usual order of selling the best and keeping the worst for home consumption." Lastly, as to the financial condition of the farmers, the opinion of a recent writer is quoted to the effect that, while the value of land is rapidly rising in the neighbourhood of manufacturing towns, on the hills "farms can now be bought for less than the cost of the buildings upon them"; and the following extract from the Report itself will show that, whatever may be the case with some, in a large number of instances the condition of the farmer is not such as to inspire a skilled English workman with envy:—"In many such cases we conceive it to be a duty that the farmer owes to himself and his family to give up the farm and work for wages. A man who has been working a small farm the past year informs me that, with his utmost efforts and the aid of his three boys, he has made just a third of what he earned as wages the previous year, when he worked in a cheese factory. Many a poor and disheartened farmer would, as a farm labourer, be comfortable, healthy, and happy."

We have seen that the cities are growing at the expense of the rural districts. In the first year of the present century towns with 10,000 inhabitants and over contained only 6.8 per cent. of the population of the State; in 1870 they contained 48.7 per cent., or all but one-half. It is evident, then, that the increase of wealth is attended by the same phenomena in New and in Old England, and it becomes of interest to inquire what is the condition of those towns which exercise so irresistible an attraction on the rural population, and what is the reward they offer to labour. On both points the Reports before us supply very full information. With respect to the houses of the working classes we read in the Report of the Bureau of Labour Statistics:—"In the cities and manufacturing towns the herding together of tenants, in large numbers and narrow limits, has become woefully prevalent. In a single building, in the town of W—, 32 feet long, 20 feet wide, three stories high, with attics, there habitually exist 39 people of all ages. For their use there is one pump and one privy, within 20 feet of each other." And the details run on in the manner with which we are all so familiar. From this extract it will be seen that, in the matter of house accommodation at any rate, an English workman betters himself but little by emigrating to the greatest, wealthiest, and most progressive of the New England States. Nor is even his pecuniary condition so much improved as the English

workman himself is apt to believe. It should be remembered that the chief cause of the great progress made by the United States during the past forty years has been the enormous immigration from Europe. Consequently every State is anxious to secure for itself as large a proportion as possible of this immigration. And at the present moment Boston is competing with New York in the offer of accommodation to steamship companies as well as to immigrants. It is certain, therefore, that no American official Board will represent the advantages enjoyed by the labourer as less than they are. Bearing this in mind, the reader will be able to appreciate the following from the Bureau of Labour Statistics:—"While in all, or nearly all, the industries we have given, the *employee* receives here a much larger income than his fellow in Europe, he will find that his rent, clothing, and provisions cost him more; he will find also that he receives or consumes more, lives in a better way, has more of the comforts and luxuries of life, so that at the end of the year, while he has but little more, if any, surplus than the European, and has worked no harder, if so hard, he is more of a man, and occupies a position some grades higher in civilization." Massachusetts is as yet not half peopled; it possesses, as we have said, a very varied industry, and it is within a day or two's journey of a practically exhaustless supply of land, which the settler may have almost for the clearing; yet, even taking the above statement at its best, it merely says that the workman is somewhat better fed and better clothed than the workman in Europe, but at the end of the year is not any richer. This, then, is all that social and political democracy, as understood in America, has yet achieved, with all the opportunities and all the possibilities of a new world before it.

UTOPIA IN THE NEW FOREST.

THIS is the season for the discovery of all sorts of wonderful things, and a correspondent of a Manchester paper who has been exploring the recesses of the New Forest has just come upon something very wonderful indeed. This is no less than a colony of English Communists, who are said to be endeavouring to work out a new social system, founded on the much discredited principles of equality and fraternity. It does not say exactly in what part of the New Forest this interesting community is to be found, but he mentions that it numbers some hundred and thirty souls, and has possession of an estate of thirty-one acres. So that any one who is curious on the subject should have no difficulty in ascertaining whether such a settlement really exists. On this point we have ourselves no opinion to offer; but one or two circumstances are mentioned in the account of the enterprise which invest it at least with a certain air of probability. For instance, the fundamental principle of the society is, we are told, that the members should hold all their property in common, and we can hardly say we are surprised, under the circumstances, to learn that "the preponderating majority" of those who have come forward to take advantage of this theory are "of the poorer, if not the poorest, classes." The Communists live, it appears, on an estate purchased for them by "a lady of wealth and position, who has given up everything—as all of them have—for the common good." The society, besides this lady, includes a Suffolk farmer, who sold off his stock in order to join, a retired London tradesman, and a "well-to-do village schemer." For the rest, the traveller did not find among them "any person of substance." The beauty of the system is of course that "poor and rich alike give up all to the community," and it is not difficult to conceive why people who have nothing at all should be particularly anxious to join in a pious sacrifice which, at no cost to themselves, at once gives them a share of what belongs to others. We are told that in Suffolk, in Hampshire, in London, and elsewhere, "there are others of the faith anxious to join the brotherhood, and only waiting till they can be received," and this is just what we should expect. One can readily believe that the "lady of wealth and position" has only to let the scheme be more widely advertised in order to secure—at any rate while her money lasts—a still larger circle of adherents. In this primitive paradise there is "no poverty in the austere sense," and "every comfort and amenity which the most thoughtful tenderness can provide are to be found here." We are afraid that when this is generally known the seclusion of the New Forest will be likely to be somewhat disturbed. The lady who has provided the estate and the chief part of the funds for keeping it going assured her visitor that she now enjoyed "that serenity and peace which she found not in travel or in the social circle"; and no doubt the friends whom she generously supports have also for the time found what they were in want of. At present the colonists "can by no means supply all their wants from the farm." This means, we suppose, that they are living on the original capital of the enterprise, which as their number increases is likely to be more quickly exhausted. To maintain even their present number, as we learn, they need considerably more land, and it will be interesting to know how the land is to be obtained. It is explained that, while the great principles of liberty, equality, and fraternity are in operation in this community, they are "subordinate to another principle—that of obedience." The Mother—that is to say, the "lady of wealth and position"—is supreme, and her government is not the less stringent because it is the "law of love." If it is true that there is "the fullest liberty with the most surprising unanimity," we may admit that the unanimity is indeed surprising. It is obvious, however, that

the liberty is seriously qualified by the Mother's supremacy. To all, we are told, she assigns their respective tasks, with the most judicious care for the tastes and abilities of each; and then we have a repetition of the old rant about each contributing according to his powers, and receiving according to his necessities. If this means anything, it must of course mean that the Mother is to determine, according to her own fancy or caprice, how much work each brother or sister is to do, and what remuneration is to be given in return: or, in other words, that the community has sold itself as a plaything to a rich old lady for the sake of what is to be got out of her.

The correspondent who furnishes this account of the happy family of the New Forest appears to write in good faith, and to have been filled with so much admiration for what he saw that it is a wonder he ever came away. "Here," he exclaims, "are no agitators and no isms; here is no money, no buying, no selling; here are no poor, no rich, none indolent, none overtasked." The explanation of this rhapsodical outbreak is perhaps to be found in a previous remark that these people are "entirely hospitable," and it may be suspected that on this occasion the hospitality was a little overpowering. It is clear at least that there is a mistake about "no money," for, as the community is stated to be incapable of supporting itself out of the farm, it must procure food elsewhere, and hence money is indispensable. It can scarcely be supposed that the brothers and sisters have converted the neighbouring population with whom they have dealings to their peculiar views as to the division of property. The society is said to include a variety of craftsmen. In one shed are tailors and shoemakers, in another carpenters, and "the miller is ready," though "as yet no mill has been erected." The flowers, the sewing, the housekeeping, the washing, and cooking are the concerns of different departments of the sisters. It may readily be believed that the clothes worn by the community are at least "unconventional," all being made or repaired by themselves. Many of the brothers indeed are wearing out the old conventional clothes which they brought with them from the world they have renounced; but it would seem that the sisters are women after all, notwithstanding their effort to get rid of the old Eve in their nature, since the very first thing they have done is to invent a new costume. This dress is, it seems, nearly uniform in pattern, though varying most widely in colour and description of material. It consists simply of a plain bodice, short skirt, and trousers. We should have been glad of a little more light on the subject of trousers, and of their relation to fraternity as a social faith, but we must be content with the general assurance that "none can realize without actual observation the peculiar, yet pleasing and attractive, effect of this dress, worn by nearly every female in the family, whether of early or mature years." Even in this Utopian state of existence it is regarded as quite a secondary matter that the dress "has the merit of convenience in a very considerable degree." As far as the correspondent's observation went, earrings, chignons, and similar vanities were conspicuous by their absence; but a good deal of vanity still lingered about the hair. "The hair is worn variously, with curls or without, but generally loose and flowing behind"; but unless the explorer had a good tug at the flowing tresses, his authority as to the renunciation of false hair is not very conclusive. One of the principal occupations of the society appears to be musical performances. The members are "universally and spontaneously musical," and it is impossible to resist a feeling of alarm lest any branch of this community should be added to the brass-bands and organ-grinders who already exasperate the nerves of people in towns. "Music is the charm of their life in the house or in the field; it is the outlet of their joy on all occasions of meeting." This outlet of joy may be all very well in an out-of-the-way part of the New Forest, but it would be apt in London to suggest a call for the police if carried too far.

Whether or not this community has any actual existence, there can be no doubt that the description which has been given of it fairly represents that maudlin sentimental ideal of a happy state of society which is cherished by many amiable people, who imagine that, if everybody could only manage to live in the country, and grow his own vegetables, out of the way of such sordid arrangements as wages to bargain for and bills to pay, it would be perfectly easy to be pure and innocent and pious. It has become a commonplace to say that delusions of this kind originate in the fallacy that a man's circumstances are something apart from his own human nature, whereas they are simply the product of it, and will continue to reproduce themselves as long as human nature remains what it is. Most educated persons can see the folly of schemes of social reform which leave these considerations out of account, when they are presented in a crude and simple form; yet it is startling to find from time to time when any question of social economy is started how many people, not especially silly, and certainly not uneducated as far as formal education goes, are under the influence of the most childish dreams as to what it is possible to do for the regeneration of mankind by establishing them in an entirely artificial set of circumstances which could not possibly be maintained. It is no doubt very rarely that any number of people are idiotic enough to commit themselves to a practical experiment in this direction at their own personal cost; but the ideas in which such an absurdity as this Communist family in the New Forest took its rise, if it really exists, exercise in a vague, sentimental way more influence on various branches of legislation and charitable effort than is at all creditable to the

intelligence of the age. In this happy family we have simply a violently exaggerated illustration of that indiscriminate and imbecile benevolence on the one hand, and that more excusable mendicancy on the other, which have so frightfully intensified the evils of metropolitan pauperism. There are too many wealthy and well-disposed persons who fancy that they are helping society by substituting alms for wages, and adding to the multitude of those who want to live on what others have earned. The project of a Socialist phalanstery has been often tried, though perhaps never before in this country, and always with the same results. It would be idle to argue against such enterprises as if there were any chance of their being seriously undertaken, except possibly once in a way by a few crazy fanatics; but it would be well if people were equally on their guard against the insidious introduction of similar theories in a disguised and indirect form.

REVIEWS.

LONG'S DECLINE OF THE ROMAN REPUBLIC.*

MR. LONG'S fourth volume brought his History down to the point at which Cæsar had to choose between breaking the laws and giving up his proconsulship of the Gauls. This fifth volume ends the work. It brings the story from Cæsar's invasion of Italy in 49 B.C. to his death in 44 B.C. Before Cæsar died the old constitution had been destroyed. Mr. Long gives barely one page to what happened between Cæsar's death and the formal establishment of the Empire. Yet he has, in strictness, performed his task. We venture to think, indeed, that his book would have had a more perfect finish if he had stopped with less abruptness at the funeral of the Dictator. He would perhaps have done even better than he has done—and he has done excellently well—if he could have spared some space to showing, in conclusion, how the strife after Cæsar's death, until Octavianus became Emperor, was waged over constitutional forms already lifeless, merely for the purpose of deciding who should be the inevitable master of Rome. Then, stopping at the literal beginning of the Empire, such a scholar as Mr. Long could well have set aside the fear of rhetoric if he had paused for a moment to glance back over his own work, and to give us a summary review of the process by which the Republic had perished. But it is only the same habit of mind which sets so strong a mark on all his work that holds him back here. We shall have to speak of it again later on; and for the present it is only needful to say that we think it has here led him wrong, because it has hindered him from doing what scarcely any one else could have done so well. The work that he has put into this part of his book, as into the other four parts, is so good of its kind that every one who is capable of appreciating scholarship of a modest and manly sort will respect it.

The years 49–44 B.C. are years of military history. Civil history, properly so called, comes into them hardly at all. Cæsar is the central figure. And he is central as a soldier, not as a statesman. After his wars he was master of Rome for barely a year—from April, 45, to March, 44. What he did in that time was to secure what he had won, and to confirm, as far as he could, order in the State. The "acts of Cæsar" prove a clear, vigorous, and subtle intelligence, sympathetic with the needs of a corrupt and almost disorganized society; intent on bringing method out of confusion; conscious that the time had still left to it that hope which Livy denies to his own—that it could endure its remedies; looking for nothing beyond his own life, for he was remote from everything in which imagination prevailed over prudence; but always bearing in his mind an imperial scheme which, if he had lived, he could have left stronger than even Augustus was able to leave it to the Emperors who spoilt it. Mr. Long is perhaps at his best when he is describing campaigns in detail. He always has the ground clearly before him; he is accurately acquainted with every circumstance which research can ascertain; he is well read in military history, and (what is rarer) in military criticism; and, without professional training, he has a naturally quick eye for the weak or the strong points of a strategy. Moreover, he is free from the trick which some writers have, of condemning a great leader offhand, yet in vague terms, for having done something which the writer does not understand, or for having failed to do something else which he could not have suggested. The five years, 49–44 B.C., fall naturally into two periods. The first, during which the Civil War was a duel, closes with the death of Pompeius in 48 B.C. The second period, during which the Pompeians were crushed successively in Egypt, in Africa, and in Spain, closes with Cæsar's death in 44 B.C. For the first period we have the three books of Cæsar's Civil War, which come down to the beginning of the war of Alexandria, leaving off where Pothinus, governor of Ptolemaeus and regent, is caught intriguing with Achilles, and is put to death. There is one great difference between Cæsar's narrative of the Gallic Wars and his narrative of the Civil War; and it is partly because Mr. Long is alive to this difference that we can follow him with confidence when he takes the history of the Civil War for his chief, or rather, in fact, for his sole, authority in the years 49–48.

* *Decline of the Roman Republic*. Vol. V. By George Long. 1874.

Cæsar narrating the Gallic Wars is a military historian. Cæsar narrating the Civil War is something besides; he is a statesman on his defence. The history of the Civil War is not only the journal of a soldier; it is also a political apology. Two places out of many may be noticed in which this character is well marked—the place in the First Book (ch. 4), where he speaks of the violent behaviour of his enemies at Rome (especially Marcus Cato), obviously with the purpose of impressing on his readers that the responsibility of the war did not rest on him; and his account of the battle which we are accustomed to call by the name of Pharsalia (*Bell. Civ.* iii. 82–99), where he first brings out that overweening insolence, those divided counsels, which prepared the defeat of his adversaries, and then remarks, in describing the comforts of the camp captured after the victory, that these were the men who used to reproach with luxury his own suffering army. But Cæsar's history of the Civil War, if openly apologetic, is candid; it is a lucid narrative, and our loss is great when we part company with Cæsar as historian at the beginning of the Alexandrine War. We can have no greater certainty than Suetonius had as to the authorship of those narratives, in continuation of Cæsar's, which are entitled the War of Alexandria, the War of Africa, the War of Spain. In spite of some difficulties, the probability seems to be in favour of all three having been written by Hirtius. At all events, they are our main authorities for the details of the Civil War after the death of Pompeius; though at almost every step we feel the contrast, in respect of clearness and of precision, between these narratives and Cæsar's history of the Civil War.

Mr. Long has shown sound judgment in his way of using other authorities also. The epitomes of Livy's lost books sometimes supply facts (or statements) not to be found elsewhere; and it is not needful to discuss here the suspicion which they have suggested that Livy, as he advanced in years and in his task, grew more prolix and more rhetorical. Plutarch, who lived under the Emperors from Nero to Hadrian, knew the war of Cæsarians and Pompeians at about the same distance as that at which we know the reign of George I.; and, in estimating the worth of his facts, it should be borne in mind that, for a biographer who wrote men's lives less with an historical purpose than with the moral purpose of illustrating their characters, it did not greatly matter whether an anecdote was apocryphal or authentic, if only it expressed—though in that exaggerated shape which a really characteristic anecdote, just because it is a chosen one, soon gets—the current feeling about a man's qualities. Appian was as far removed from the age of Cæsar as we are from the age of Anne; Dion as far as we are from the earlier years of Charles I. In their different ways, however, the two Greek compilers are valuable. Those who should judge Appian only by his *Hannibalian War*, where he has the ill-luck of serving as a foil to Livy, would do no justice to his *Civil War*, a work on which he had evidently bestowed more pains, and of which the subject was more in his grasp. Dion had a thorough knowledge of Roman history, and of the Roman Constitution; as a senator, and (for a time) as a consul, he had access to official documents; and these things make him really nearer to the time of Cæsar than either Appian or Plutarch. If there is a point on which we should differ with Mr. Long in his estimate of the secondary authorities for the Civil War, it is about Dion, whom we should rate somewhat more highly than Mr. Long seems disposed to do. We cannot help suspecting that Appian has won Mr. Long's heart by a congenial brevity and plainness. Dion generally tells his story in more words, and often seems to aim at giving the impression of truthfulness by enumerating particulars. To illustrate the difference between the manners of Appian and Dion, we would compare their narratives of that mutiny among the Campanian veterans which Cæsar suppressed at Rome in 47 B.C. (*Appian, B.C.* ii. 93; *Dion*, xiii. 52). The value of Cicero's letters and speeches for the history of the time is not much weakened by the fact that his political calculations were generally wrong, and his judgments of persons, especially of Cæsar, often foolishly unjust. Mr. Long uses the evidence of Cicero's writings wisely; and, what is perhaps harder, especially in these days of a widespread conspiracy to raise the ghost of Conyers Middleton, he is fair, even when he is unfavourable, to Cicero.

Cæsar, pursuing Pompeius, sailed from Brundisium for Epirus in January, 48 B.C. Between his sailing and the battle of Pharsalia the chief event was his unsuccessful blockade of Pompeius, near Dyrrachium. These months were the real crisis of the Civil War, and it is on the operations which they comprise that military criticism has been concentrated. The first Napoleon blamed Cæsar for crossing the sea from Brundisium to Epirus. Observing that the legions collected at Brundisium came from Spain, from Gaul, or from the banks of the Po, Napoleon contends that Cæsar ought to have led them through Illyria and Dalmatia to Macedonia. From Placentia, the point of intersection of the two routes, the distance to Epirus is about the same. The army, Napoleon argues, would have reached Epirus united, and the passage of the sea—a risk which, in the presence of a superior squadron, was near proving fatal—would have been avoided. Goeler, himself a soldier, makes a remark about the right way of reading Cæsar's *Commentaries* which perhaps applies to Napoleon's criticism. Cæsar assumes, as known to his reader, much that a modern reader can learn only by laborious and minute inquiry. Napoleon did not occupy himself with such minute inquiries. There may have been difficulties about supplies which Cæsar knew, and which rendered impracticable such a land route as that which Napoleon suggests. Further, as Mr. Long says, supposing that Cæsar had marched to

Lissus, is it certain that he would have found Pompeius there? It was neither impossible nor improbable that Pompeius might meanwhile return by sea to Italy (*Cæs. B. C.* iii. 29). As to the failure of the blockade near Dyrrachium—a more decisive check for Cæsar than even that before Gergovia (*Long*, iv. 318)—Napoleon's criticism may be just:—"How could he hope to maintain himself advantageously on a line of contravallation six leagues in length, blockading an army which was master of the sea and occupied a central position?" Yet neither Napoleon nor any one else, so far as we know, has suggested what better thing there was to do. The shade of Cæsar might reply to his critics:—

Si quid novisti rectius istis,
Cautidius imperti.

Mr. Long tells the battle of Pharsalia (as we call it) almost in Cæsar's words—adding (chiefly in foot-notes) some illustrations which make the narrative a clear and complete whole. Pompeius had ordered his men to await in silence the enemy's attack. Cæsar says that he thinks this was a mistake; a commander ought to encourage, not to repress, that elation of spirit which is caused by the ardour for battle. Cæsar's troops charged with a shout. Here Mr. Long brings old and modern experience together by quoting Sir Garnet Wolseley (in *The Soldier's Pocket-book*):—"A ringing cheer is inseparable from charging. I do not believe it possible to get a line in action to charge in silence; and, were it possible, the general who deprives himself of the moral assistance it gives the assailants would be an idiot." Mr. Long, the most severe of writers in his renunciation of ornament, occasionally seems to indemnify himself by putting into his text what would more naturally have been put into an appendix. The short chapter (xvii.) on the site of the battlefield, which he subjoins to his account of the battle, is a case in point. Cæsar does not name Pharsalia any more than he names the Rubicon. The only place that he names in connexion with the battle is Larisa, whither Pompeius fled. Opinions have differed much as to the spot on which the battle was fought. Mr. Long agrees with Goeler and with General W. Napier in holding that the ground was somewhere north of the Enipeus (Goeler's Apidanus), but does not commit himself to the details of Napier's view, which places Cæsar's camp facing west, with Scotussa in the rear, and the camp of Pompeius facing east at the foot of some heights which border the Enipeus.

Every one knows Mommsen's picture, or rather his enthusiastic refusal to attempt a picture, of Julius Cæsar, where he speaks of the eyes which had been privileged to look on that perfection almost as Dante speaks of those which had beheld Beatrice in the earthly life. Here is the opening of Mr. Long's last chapter, at the head of which we read "Cæsar" (p. 467):—

I do not propose to write a character of C. Julius Cæsar. The drawing of characters is a kind of work which I do not greatly value; and it is unnecessary when we know the acts of a man's life from his early years to the day of his death. . . . But I do propose to collect in a brief summary the principal facts which show us what Cæsar was, and as he appears in this history, in which I have told the truth as far as we know it, and have told it with perfect impartiality. I shall add a few things to show more clearly the man's great and varied talents. His biographer Suetonius and other writers will be authority for those facts.

Severity of this type is sincerely admired by a few, and secretly thought classical by as many as see their way, however dimly, to translating it into Latin prose. But when a scholar is writing about a far-off age which plain folks find it hard to see with any vividness, is it true that the drawing of characters is a kind of work which is not to be highly valued? Would not historical literature be the poorer for losing some of those portraits in which thorough and subtle inquirers have embodied the results of long study, and have kindled the whole with the breath of life from a genius too sane and too self-controlled to indulge in creating when its task was to revive? To take an instance from ground which Mr. Long has lately been traversing, there are probably few students of Roman history who do not see both Cæsar and Sulla more clearly for having read Mr. Freeman's analysis of Sulla's character and his comparison of the two dictators—a comparison, by the way, which comes to the mind with curious force when one finds Pompeius trying so hard to believe, and to make believe, that he is the new Sulla. Mr. Long is a first-rate scholar, a workman who spares no pains, and an historian who has the cardinal virtue of wishing before all things to get at the truth. But, in his extreme dread of being wise above that which is written, he sometimes reduces the province of the historian almost to that of a verbal commentator on original authorities; and, in an overstrained pursuit of plainness, he not only deprives his style of grace and life, but foregoes much that would help the memory and quicken the insight of students. Mr. Long worships Altheia as Athenians worshipped the Eumenides—with wineless offerings. But his work is able and thorough, and it will last. Those who have gone over the ground on which Roman dominion was first planted in Gaul remember the place between Nîmes and Avignon where a sudden turn of the road shows a Roman aqueduct, hardly touched by time, spanning the valley of the Gard. The work with which Mr. Long has bridged the years of the declining Republic is not less stern or less solid; nor perhaps the less fitted, because it is not the channel of a sparkling stream, to be an enduring memorial of the hands that wrought it.

PRAIRIE AND FOREST.*

THERE can be no doubt that the author of this work and of several others of a similar nature is as true a sportsman as ever handled rod or gun. He can find, kill, and cook his own game. He is an adept at tying his own flies. He is prepared to rough it on the lone prairie with a blanket or a buffalo hide and a few branches for his sole shelter, while wolves prowl round his encampment, threaten to attack his horses, and poetically watch his "slowly dying fire." He has shot golden pheasants in China, and wild fowl in the islands of Jura and Mull. In short, there is scarcely any kind of sport, from trout-fishing to encounters with the grizzly bear, which he has not attempted with complete success. We could even wish that he had thought it worth his while to pay a visit to some of the hunting-grounds of our Indian dependency. A book by "Ubique" showing how snipe are shot in the plains of Lower Bengal, or how tigers charge a line of elephants in the Terai of Rohileund, might have infused some novelty into Oriental narratives of this kind, and the author would probably have detected analogies between the skill in trapping displayed by half-breeds and the coolness and self-possession not seldom evinced by native Shikares, Santals, and Bheels. We could, however, wish that the writer had thought fit either to write his adventures in ordinary English, or else to translate or explain divers expressions which, though full of native pith, sadly require the aid of a commentator. In some instances we get help from the context. We can make out that a "windfall" in the depths of a Canadian forest does not mean a piece of good luck, but a piece of timber blown down by the tempest and blocking up the woodman's path. A horse is said to "rouch" when he shows signs of buck-jumping. To "tree a covey," it may be easily conceived, means to make grouse take to the branches, where they are easily slaughtered for the pot. A "blazed," or "blaze road," does not mean, as might be imagined, a path cleared in the forest by settlers who apply fire to the scrub, but one marked out every hundred yards or so by scooping out a bit of bark from a birch or other tree. "To margin," like the new verb "to loan," is used by Americans in a transitive sense. Rail-roads in the Far West are spoken of as "the cars." Canyons and gulches are used to express gorges and ravines. The former, we understand, comes from the Spanish. We can dimly assign a meaning to the term "bowers" in card-play, relatively to "aces and kings." It would be more correct for a sportsman to speak of a bird as "winged" than as "pinnioned" by a snap shot. But these curiosities of literature in the Far West are venial compared to the sin of plagiarizing illustrations without the slightest acknowledgment. No less than four pictures are taken by Mr. Gillmore from *Forest Life in Acadie; or, Sketches of Sport and Natural History*, by Captain Campbell Hardy, of the Royal Artillery, published in 1869. The frontispiece of the work with which we are now dealing represents two moose deer, one reclining at ease and the other pulling down a huge branch. It is described as "A Summer Retreat." In Captain Hardy's work, p. 73, this is more properly designated "A Moose riding down a Tree." In like manner the incident of "Moose Calling" at p. 56, the two cariboo at p. 73 in their winter coat, and the Canadian trout stream at p. 342, are all three copied, line for line and shade for shade, from pictures in the earlier work, where they are however designated, the first by the same title, and the others "On the Barrens," and "The Pabineau Falls, River Nepisiguit." Either then the author has omitted to mention that he had Captain Hardy's authority to use these sketches, or he has assumed that a right of freemasonry in the matter of materials and experiences must exist between all veteran sportsmen, or he has trusted to the forgetfulness of his readers and to the rapidity with which in these days one book drives another out of the field. "O'est mon bien," said Molière, when skilfully adapting to his own plays the rough metal of inferior writers; "et je le prends partout où je le trouve." But Molière, and even Puff himself, would hardly have thought it allowable for great wits not only to think in the same grooves, but to reproduce, as by photography, the sketches of a gifted predecessor. Moreover it is to be observed that the picture of the above-mentioned falls, where the skilful angler is presenting the butt-end of his rod to a heavy fish in the most approved fashion, though termed by Mr. Gillmore a "Canadian Trout Stream," is placed opposite the narrative of an expedition up the Androscogan, or Mud River, in the northern part of the United States, in which river he appears to have been rewarded by baskets of splendid trout.

No Red Indian in Fenimore Cooper's novels could mourn more pathetically over the annoyance which animals and their pursuits experience in encountering the encroachments of an irresistible civilization. It is fair to state that Mr. Gillmore's strongest epithets are reserved, not for speculators who introduce saw-mills and factories, but for those who pollute rivers with refuse, or erect dams up which it is impossible for fish to climb. Equally severe, too, is he in the case of sportsmen who revel in slaughter or kill more than they can consume; nor, while holding out to Englishmen who are driven from the Scotch moors by expense, and from Norfolk battues by satiety, the exquisite fascinations of sporting where no permission need be asked, does he disguise the inconveniences, discomforts, and perils which they may have to undergo. Even a Northern State like Maine is for six weeks unendurable, owing to black-flies, sand-flies, and mosquitoes. The remedy of lubricating the exposed parts of the body with oil of tar is

precisely one of those which sound as bad as the disease itself. Then visitors are reminded that, even when merely bent on trout-fishing, it is just as well to take a gun as a protection. They must be prepared occasionally to sleep on piles of hemlock; and it is clear that no one ought to attempt to follow Mr. Gillmore's footsteps who is destitute of nerve, who cannot be his own game-keeper, cook, valet, and even doctor, and who lacks that quality of "handiness" which Lord Lytton ascribes to one of his latest and not least happy creations, Kenelm Chillingly. But the real test of a work like this will always be the contribution which the author makes to our knowledge of natural history and of the habits of the birds and beasts still to be found in no inconsiderable numbers on the Canadian and American rivers and lakes. It is not enough that a man should tell us with some point, animation, and descriptive power, the steps that he took to capture a monster trout, or the admiring envy which he excited in the breasts of genuine Yankees by slaying the big buck who had been known to baffle all exertions for years, and who was believed invulnerable to bullets cast in any human mould. Every man of keen perceptions and active habits who has had an ordinary education can do the same. Even the description of a personal encounter with a big bear which is slain with duck-shot has a family resemblance to adventures with bears, tigers, jaguars, and leopards to be found in Lloyd's *Northern Field Sports*, in Washington Irving's *Tour on the Prairies*, and in half-a-dozen Indian sporting magazines and reviews. These parts of the work, as well as his meeting with an ex-schoolmaster who sang psalms through his nose and was occasionally given to cheating at cards, may be passed over summarily; and we turn to the notices of the habits of beasts which either endorse or correct past experience, or to those of the game-birds that seem to exist for the very purpose of acclimatization in England. An old bull buffalo, deserted by friends, or too slow to follow the herd, was attacked in the author's sight by four prairie wolves. These animals seemed perfectly well aware of the necessity of dividing their labours ere they could divide the spoil. One made a feint at the head, while the others in the rear watched their chances or inflicted wounds on the aged animal's neck. Mr. Gillmore seems to think that while three of the wolves took it in turn to make false attacks in front, the fourth, as the most experienced, always tried to pin the buffalo behind, though a well-directed kick might have turned the scale against the assailants. The indignant sportsman stopped for a time the unequal contest by a war whoop, which he says disgusted the wolves without calling forth any gratitude from the ancient buffalo, who forthwith charged his deliverer; a fact which, of itself, would throw doubt on the old story of Androcles and the Lion. And the author then goes on to moralize on the fate of the leader of the herd in a strain which reminds us of Evan Dhu speculating on the probable fate of his friend Donald Ben Lean, the cattle-lifter, who, as the Highlander explained to the astonished Waverley, had far better "die for the law" than perish in a dark hole "like a mangy tyke." Thus the proper end of the effete buffalo "after a long and happy life" is, we are told, to die "in a gallant and short struggle, overpowered by his too numerous enemies, a death worthy of a hero."

On another occasion Mr. Gillmore was more successful in driving off a pack of wolves from a young cow buffalo with a baby calf between its legs, for he rolled over the foremost aggressor with one barrel and disabled another with his second. The mane of the American buffalo as well as his thick coat is deemed by the author a wise provision of nature intended to lessen the shock of the inevitable encounters which take place between rivals in the spring season. Unconsciously, as we think, Mr. Gillmore reproduces in prose the well-known scene of the Third Georgic:—

Ilh alternantes multâ vi prælia miscuit
Vulnibus erebris
Versaque in otia iuxta iungitur cornua vasto
Cum gemitu; reboant silvæque et longæ Olympus.

But these encounters never terminate fatally, for, according to classical precedent,

Victus abit, longæque ignotis exsulat oris.

Another danger to which the buffalo is exposed is that of drowning when the streams in spring are encumbered with broken ice, or of falling into quicksands in the "Western country." An instance is given where the fear of man prevailed over the sort of fatalistic apathy to which one of these unfortunate beasts was helplessly yielding, and forced it to struggle on to firm land. The plains of Bengal, it is well known, even when under cultivation, maintain large but diminishing herds of these same animals; and specimens of horns of enormous size can be procured in the dense jungles of Assam. But for the bison, or buffalo with a mane, the sportsman must go to the Central Provinces, or to the forests and hill ranges of Madras. The musk sheep seems to unite most of the characteristics of the ovis with some of those of the bos. Its feeding grounds, its agility, and its food stamp it as a sheep. In size, look, and flesh it partakes somewhat of the nature of the ox. Two eminent naturalists have compromised matters by describing the animal as *Ovibos*. But our author would place it in the former category. We have no space to detail the interesting peculiarities of the Cariboo, the Wapiti or Canadian stag, and the Virginian or fallow deer. And, if wolves are often speared by American or Canadian sportsmen on horseback, all we can say

* *Prairie and Forest: a Description of the Game of North America, with Personal Adventures in their Pursuit.* By Parker Gillmore, "Ubique," Author of "Gun, Rod, and Saddle," &c. London: Chapman & Hall, 1874.

is that these animals must have rather less endurance and speed than the wolves of India. Not half-a-dozen of the best Indian cavaliers mounted on Arabs of the highest temper, caste, and endurance have ever boasted that they have driven a spear into a wolf or a black buck in a fair chase.

The remarks on the species of grouse found in Northern America point, as we have said, to their acclimatization in England as a legitimate means of diversifying sport. Hitherto we have been familiar with the pennated and the ruffed grouse only through the medium of specimens displayed in poulterers' shops in winter. They are slain in large numbers in the autumn, packed in ice, and shipped for the London market. But there must be several districts in the British isles where some of these distinguished foreigners might be introduced without difficulty and without giving gamekeepers occasion to ascribe to them a perceptible diminution in our indigenous game. The pennated grouse, like black game, lie close in the commencement of the season, but pack together in wild or severe weather. We could well spare them as we have done, but we agree with the writer in desiring to introduce into the woods of Scotland and our northern counties, not the pennated, but the ruffed grouse, and also the Virginian quail. The former lie well to dogs, are not given to running, flourish in hazel and birch woods, are swift on the wing, and can live on ants, gnats, and grain. The flesh is said to resemble that of our red grouse, and the bird can stand great variations of climate. Similar arguments may be pleaded for the acclimatization of the quail. It is not migratory in the sense in which we apply this epithet to the Continental species. It has a strong and rapid flight. It is suited to the same localities as the partridge, and is not quarrelsome, except with others of its own kind. When noblemen and gentlemen shall take a pride in treating their guests, not to the largest amount, but to the greatest variety of slaughtered fowls, we may hope to see the wish of the author carried out. To the genuine sportsman nothing is so attractive as the outturn of a fair bag where the snipe and golden plover appear nestling under the wing of a blackcock with his tail out, and the earliest pheasants drop out in proximity to the grouse in full plumage, both killed, the latter with No. 4, at the close of a good day at the end of October. We can recommend Mr. Parker Gillmore's work to those who love sporting adventure for the physical exercise which it involves, and for the demands which it makes on man's ability to circumvent wary animals and quick-sighted birds. And we shall be much surprised if this publication does not induce men of leisure and enterprise to seek for novelty and possibly to exercise their turn for philology in Transatlantic wildernesses, including three lovely lakes with the familiar and easy appellations of Molley chunkymunk, Mooseluckmaguntic, and Moligewalk.

BLACKIE'S MORE HELLENICÆ.

PROFESSOR BLACKIE is half behind his age and half in advance of it. And, as the Professor has a very respectable power of giving hard knocks and a thorough good will to give them, the present generation of scholars comes in for knocks on both sides. Mr. Blackie has in a manner achieved the same exploit as Kehama and Sir Boyle Roche's bird. He is ready in two places at once, Themistokles and Adeimantos in one, to chastise with the same rod those who lag behind and those who, to his thinking, get on too fast. At the same Mr. Blackie is by no means so fierce in Greece as he is in Scotland; the air of the ancient Athens does not draw out his combative powers so freely as that of the modern. He is not nearly so fierce—we were going to say not nearly so silly—when he is talking about Greek matters, *klephts* among them, as when he is talking about "quidam latro publicus" nearer home. We had any day rather like to hear him sing a song about Theodore Kolokotronis than a song about William Wallace. Mr. Blackie is on some points pre-scientific, and, like most pre-scientific people, he is a little angry with those who are more scientific than himself. And he has a foolish way of sneering at Germans, which is not uncommon among those who cannot read a German book, but which is rare among those who, like Mr. Blackie, certainly can. But, whatever else he is, Mr. Blackie is never dull, not even when, as it almost seems, he tries to be so. Why should a man put his essays and discussions into a shape so needlessly formal, and therefore so needlessly frightful, as to number his paragraphs Proposition I., Proposition II., till they sometimes reached the stage of Proposition XLIV.? And why should he put such a stumbling-block in our way as to tell us in the very beginning of his preface that the points of Greek philology and antiquity upon which he proposes to speak are those which "appeared to him to have been unduly subordinated, or altogether neglected, by British scholars, or unwisely handled by men of acknowledged talent and reputation." We do not in the least doubt that Professor Blackie's essays "are the product of hard reading and hard thinking." We fully allow that they "raise some questions worthy of being seriously grappled with by English scholars"; we should not for a moment doubt that Mr. Blackie, even apart from his "professorial position," "desires that truth should be stated, and error combated on as open a field as possible"; nor, if he had not put himself into our head, should we

have "attributed their present publication to any undue amount of self-esteem." When we are ready to grant so much, it is hard to have to spell out a sentence which tells us how the essays, "originally published in the Transactions of learned Societies and Philological Reviews, laboured under the double disadvantage of being with difficulty consulted, and with facility ignored." The disadvantage is a most real one, and it is constantly felt both by writers and readers. If a man writes anything in the Transactions of a learned Society or in a Philological Review, he is sure to be disappointed by finding that somebody who he hopes has read his paper has not read it. And, on the other hand, a man who is seeking for knowledge in all quarters about one particular subject finds, when it is too late, something very much to his purpose lies hidden in the pages of the Transactions of a learned Society or in those of a Philological Review. The Germans, whom Mr. Blackie so much dislikes, really deserve a knock or two, and the Swiss deserve still more, for thus hiding some of their best writings in places where they are "with difficulty consulted and with facility ignored." Only we should not have thought of making our mean on this head in a sentence which, though not specially long, needs to be read over again before we grasp the meaning, just as if it were a German sentence with the verb half a mile away before the nominative case. Mr. Blackie gives us a list of eight other papers in various periodicals which he has not reprinted, but which he says "contain matter that might reward a glance from persons interested in the subject which they discuss." We rejoice to hear that a lecture by Mr. Blackie on the "Classical Affinities of the Gaelic Language," published some years ago, and now out of print, was so lucky at the time as to "meet with a very favourable reception from competent judges," and that his only reasons for not reprinting it are that he "hopes soon to be able to carry on his studies of Gaelic philology to more worthy conclusions," and also because certain other scholars are likely "to set their hands so seriously and stoutly to the work that any further excursions on his part into a domain not specially his may be rendered unnecessary." Of the pieces thus shut out, that which we should be the most inclined to ask for is one "On the Character, Condition, and Prospects of the Greek People," which we do not doubt "might reward a glance." Modern Greek matters are Mr. Blackie's strong point, and he is always at his best when he is talking about them.

One more phrase in this preface calls for some notice. "So far," says Mr. Blackie, "as my antagonism to certain philological and mythological speculations of my distinguished friend, Professor Max Müller, is concerned, I have seen nothing from his pen, or from that of any other person, that in the slightest degree moves me to any qualification of what I have distinctly stated on these points." It may therefore be well to look to those passages of the essays which may give us some notion what are the ideas about philological and mythological matters to any qualification of which nothing has in the slightest degree moved Mr. Blackie. First of all, we are not attracted when we come to such phrases as "a mind not violently possessed by German theories," "the erudite fairy-mongers beyond the Rhine," "the great Berlin nationalist," "any but a thorough-paced German idea-monger"; and then we go on to find Mr. Blackie talking about "the Germans," "the German school," as if all Germans thought alike, and as if there were not a hundred German schools. After this, we are not surprised at some of the other things which we find. Conceive a man who, having spoken a few times before of Professor Max Müller and other Sanscrit scholars, and not having spoken of any other modern writers for three or four pages, talks about "the man who at the present day shall attempt to interpret the Greek gods from the transliteration of Sanscrit or Hebrew words." And, a few pages back, we read:—

Comparative philology, like archaeology, recovers the earliest history of a people before writing was known; and this raises the inquiry, whether a mythology which bears a foreign nomenclature on its face may not convey foreign ideas in its soul—that is, to take an example, whether the Greek mythology, if the names of its personages are more readily explained in Hebrew or Sanscrit than in Greek, may not, in respect of its ideas and legends, be more properly interpreted from original Hebrew or Sanscrit than from native Greek sources?

It is not very clear whether Mr. Blackie is here speaking in his own name or in that of somebody else. But it is plain either that Mr. Blackie himself thinks, or else that he thinks that somebody else thinks, that to go to Hebrew and to go to Sanscrit for an explanation of Greek words or of Greek myths are exactly the same kind of process. To Mr. Blackie Sanscrit and Hebrew are both in "the East," and that is enough. He directly after tells us in his text:—"The prospect thus held out of tracing famous European religious myths to their far home in the East is extremely inviting." And he adds in a note a quotation from—Bryant:—"The whole theology of Greece was derived from the East." It is plain to Mr. Blackie that Bryant is quite on a level with the person whom he seems to refer to in the following sentence:—

The last source of Greek myths, for which a strong claim has recently been put forth by a German of distinguished talent, taste, and learning in this country, is Sanscrit.

It would perhaps be in vain to explain to Mr. Blackie that no one goes to Sanscrit as being in any strict sense the source of Greek myths. But it is amusing to hear him go through Egyptian, Hebrew, Phœnician, and Sanscrit theories, and in the end pronounce the last to be as much a failure as any of the others, and seemingly rather more of a failure than the Phœnician theory. This is the kind of thing which Mr. Blackie gives us by way of

* *Hora Hellenica: Essays and Discussions on some Important Points of Greek Philology and Antiquity.* By John Stuart Blackie, F.R.S.E. London: Macmillan & Co. 1874.

"a necessary protest against some ingenious aberrations of Max Müller, Gladstone, Inman, and Oox, in the method of mythological interpretation." Mr. Blackie has the advantage of us with regard to the third name on his list; but we should never have thought of classing Mr. Gladstone among comparative mythologists, and as for Professor Müller and Mr. Oox, whatever their aberrations may be, Mr. Blackie has not yet taken the first steps towards qualifying himself to judge whether they are aberrations or not. It is perfectly plain that the Edinburgh Professor of Greek does not yet know what comparative philology and comparative mythology are. And this is the more pity because, though Mr. Blackie does not know whence words come, he does know in some cases, as his papers on modern Greek show, whither words go. He seems to know as little of the history of his own language as he does of the history of Greek. As he seems to think that there are people who derive Greek from Sanscrit, he himself seems to derive English, or some part of it, from High-German. English is in his eyes (329) "a merely derivative and mixed language," and (137) "the Saxon half of English is a sort of amputated German"; and in another place (134) he speaks of the loss of the initial *gc* in the English past participle as "a change which the German has suffered in passing into English"; and again (226) he tells us that "the original form" of the English word *slay* "is the German word *schlagen*, to strike." Opposite to this we are not unnaturally told that the Latin *fur* is derived from the Greek verb *φαρμις*. Here then we have some of the doctrines which nothing from the pen of Professor Müller or any other person moves Mr. Blackie to qualify in the slightest degree. The faith on which Mr. Blackie stands so firm is that English is derived from High-German, that Latin is derived from Greek, but that Greek is not derived from Sanscrit. This last, we must beg leave to explain to Mr. Blackie, is a doctrine which neither Professor Müller nor any other man who knows what he is talking about would for a moment think of disputing.

But, notwithstanding all this, we have a good deal of tenderness for Mr. Blackie; if he would only keep to what he really understands, he would do good service. His graver essays, philosophical and historical, may be read with some interest, though perhaps he now and then gets a little out of his depth, and he certainly miscalculated his own powers when he took upon him to do battle with Mr. Grote. The real value of the book, as of all that Mr. Blackie has hitherto done, lies in the modern Greek part, and in the dealing with the question of accent. The last paper, "On the Place and Power of Accent in Language," we have reviewed before when it came in a separate form, and we expressed a hearty general agreement with it. We are more and more convinced that it is quite possible to read Greek so as to preserve both accent and quantity. To do so is certainly hard work for those who are not used to it, but it is most likely no harder than a great many other things in our own and in all other languages, which seem easy enough to those who have been used to them from their childhood. Yet, after all, the process of phonetic corruption in any case shows that one sound really is harder than another. It is quite possible, not only to say *ἀνθρώπος* without making the *ω* short, but even, which to us is much harder, to say *σοφία* without making the *ι* short. But it is clearly easier to say *ἀνθρώπος* and *σοφία* or *ἀνθρώπος* and *σοφία*, and so the modern Greeks have gradually sunk into the one corruption, while Western scholars have deliberately chosen the other. In this essay, and in both his essays on the modern Greek language, all that Mr. Blackie says is quite to the purpose as far as it goes; but even here he fails really to get to the bottom of his subject. He does not at all attempt to trace the evidence which we have in abundance to show that some of the features which distinguish modern Greek from ancient can really be traced up to the most ancient form of Greek that we have, much as French and Italian uses of Latin words which are not to be found in Cicero are often to be found in Plautus. Nor again does Mr. Blackie at all mark the evidence which ecclesiastical and mediæval language gives as to the early date of the present Greek pronunciation, just as the Greek of the New Testament gives us one stage of the process by which modern Greek grew out of the ancient. In short, there is a great deal to be said about Greek accents and about modern Greek which Mr. Blackie does not seem to have thought of. But he has the merit of having been one of the few, and we believe one of the first, to think of these matters at all; and with that merit we will gladly leave him.

LONSDALE'S LIFE OF DALTON.*

IT is as a sketch of the life and personal characteristics rather than as a summary of the scientific labours or discoveries of Dalton that Dr. Lonsdale has put together the present memoir of one of the most distinguished among the worthies of Cumberland. Satisfied with the justice already done to the intellectual powers and achievements of the Northern philosopher by Dr. William Charles Henry and Dr. Angus Smith, he has made it his task to set forth with greater fulness the private or domestic side of his career. Not that Dalton's great services to chemistry are passed lightly over or inadequately treated, special chapters being devoted to the history of each of his prominent discoveries; but what his present biographer claims in particular to have done consists

in having brought together much original information, in part drawn from letters of Dalton's own, with many of which he has been favoured, in part derived from the conversation of intimate friends and associates of the philosopher. Among these he especially mentions his late worthy friends, Jonathan and Jane Carr of Carlisle, who had been pupils of Jonathan and John Dalton at Kendal, and retained lively recollections of the junior schoolmaster, many members of the Society of Friends in the North and elsewhere, and several of the Fletcher family, with whom John Dalton had been intimate from very early days. Dr. Lonsdale's work is somewhat marred by a tendency to grandiose and stilted writing. Every common day is with him a "diurnal." In his prefatory chapter upon the early history of chemistry we have a deal of tall-talk about "man's endeavour to fathom the impenetrable problem of his own genesis, and the gradatory lines of his intellectual moral development," with roundabout allusions to the "esoteric angels with naughty longings for Eve's fair daughters," and so forth. In even worse taste is his making George Fox find no better aids to salvation "at the hands of the spiritual directors of the State Church than a recommendation by some of beer and concubinage, by others of tobacco and psalmody," and speaking of his success in "carrying the pluralist vicar of Brigham off his tithe legs and all his congregation to a free ministry." Worst of all is a tendency to sallies of what he is obviously pleased to consider wit, which when not feeble is coarse. It is not till he gets into the heart of his subject, catching it may be something of the native simplicity and sober plainness of the man he has to describe, that he shows himself worth attention.

An anecdote of John Dalton late in life gives the true key to the success upon which he could look back, and to his triumph over difficulties which might well have seemed insuperable. Entertaining a friend and his son at supper at an hotel, and inquiring into the youth's progress in study, the philosopher ended by saying, "Thou seems to have better talents than I possessed at thy age; but thou may want the thing that I have a good share of, perseverance." The son of a poor weaver—a man of no parts, who was thought but a feckless sort of man, and could hold out to his son no higher expectations than that of plying the shuttle, to which his childish fingers were set at the earliest moment—it was by dint of sheer plodding and of persevering toil that Dalton fitted himself for the struggle of life and led the way to the achievements of his after years. The plain and lowly dwelling is still shown where he first saw the light at the little village of Eaglesfield, near Cockermouth, chiefly famed as having given name or title to the founder of Queen's College, Oxford, and chaplain to Queen Philippa. Some small property had, it would seem, come into the family from the Fearons, one of whom Jonathan Dalton, John's grandfather, married in 1712, amassing a further amount of wealth in land and hereditaments to the value of some 35*l.* a year, which on the death of his eldest son, also named Jonathan, fell to John's father, Joseph. It is believed, too, that his wife, Deborah Greenup, brought to Joseph a slender dowry as well as an active mind, great energy, and quick intelligence, which qualities doubtless had their effect upon the character and intellect of John, who, with an elder brother Jonathan and a sister Mary, alone of six children grew up to maturity. Not that the boy was by any means of quick or ready intellect, sharp at work, or demonstrative at play. Constancy of purpose and thoughtful self-reliance were the qualities which most marked his early years, and won for him the interest and good will of the excellent Quaker master of Pardshaw Hall School, Mr. John Fletcher, under whom he was enabled to get through arithmetic and navigation before the completion of his twelfth year. At ten he gained vast credit by setting right a lot of mowers who wrangled over the difference between sixty square yards and sixty yards square, as well as by delivering a lecture extempore from a hedge to his juvenile mates on the way home from school. Still more fortunate was he in securing the friendship of a Quaker gentleman of ample means and knowledge, Elihu Robinson, "the man of Eaglesfield," the founder of Cumberland meteorology, the friend of Collinson, Franklin, Fortherrill, and Clarkson. Science and literature owed much in those Northern lands to the aid of leading Friends. At Robinson's house John Dalton worked much with William Alderson, his senior in years, keeping generally ahead of him, and spurring him on when inclined to seek the master's aid by his broad Cumbrian "Yan nien deun't" (one might do it). In his thirteenth year—1779—the energetic lad is found opening a school on his own account at Eaglesfield, first in an old barn, next in his father's house, and finally in the Friends' meeting-house. Whilst coping with lads and lasses often older than himself he was steadily improving his own powers, aided not a little by the Ladies' Diary or Almanac for that year, which he copied verbatim, and the problems in which he worked out with his companion. After two years of teaching, which never brought him in, it is thought, more than five shillings a week, he was glad to eke out his means by occasional husbandry.

When nearly sixteen, he was induced to join his brother Jonathan, then an usher under Mr. Bewley at Kendal, on whose retirement the brothers continued the school on their own account in 1785, with their sister Mary as housekeeper. Their educational course, originally confined to English, Latin, Greek, and French, with writing, arithmetic, merchants' accounts, and mathematics, was extended a few years later so as to include probably more than was then taught in any public school in the kingdom, adding, as it did, to those studies nearly the whole range of subjects comprised under the heading of natural philosophy. Yet the returns brought in by all this diversified labour seem barely to have reached 100*l.* a year, including the pittance earned by drawing

* *The Worthies of Cumberland: John Dalton, F.R.S., Hon. D.C.L. Oxon, &c.* By Henry Lonsdale, M.D. London: Routledge & Sons. 1874.

conditions, making wills, and similar half legal, half scholastic avocations. The Daltons were known as strict disciplinarians to an extent which in one instance is said to have brought them somewhat prominently before the public. John, though the less severe of the two, is reported by surviving pupils to have been far from conciliatory in method, or disposed to bring out the kindlier feelings of his scholars. The bucolicism of Eaglesfield still clung to their nature, and was probably in no degree relieved by the stiffness and formalism symbolized by the rigid collar and broad brim. Such were his powers of abstraction that John Dalton could, it was said, in all the turmoil of a class of thirty or forty scholars, direct his mind to working out problems in the higher mathematics. On the 26th of October, 1787, he delivered his first set of lectures on natural philosophy, at the rate of half-a-guinea for the course of twelve, or one shilling a single lecture. The same lectures he repeated four years later at no more than five shillings the course—a sign of the slender success attained in the first instance, whether from some defect in the lecturer or from the lack of local interest in matters of physical science. All the while he was pushing his studies, stimulated and guided by the remarkable energies and abilities of John Gough, whose profound and diversified learning, in spite of his blindness, is described in a letter of Dalton's in terms no less glowing than those of Wordsworth's verse. It was in the form of replies to questions in the Gentlemen's and Ladies' Diaries that Dalton first brought his powers before the public, winning prizes from time to time for problems in mathematics and hydrostatics, whilst he appears at the same time to be bestowing much attention upon chemistry. Botany and entomology entered largely into his study of nature, and it was above all in meteorology, favoured by the conditions of climate peculiar to his native county, that he found the basis of his ultimate command of the chief secrets of physics. He is seen noting and recording with infinite patience the changing conditions of the atmosphere by the aid of instruments simple and far from adequate, for the most part of his own making, yet working out results on which a new science has been built. Without any fundamental knowledge of anatomy or of the physiology of man, he fell upon a plan of his own for testing and methodizing the processes of nutrition and sustentation in the human frame, weighing daily his own *ingesta* and *egesta*, including the perspiration. The idea of making medicine his profession is broached in a letter to Elihu Robinson in August 1790; but neither from Robinson nor from other friends did he receive encouragement enough to persevere in that line. After twelve years at Kendal, on the recommendation of John Gough, he removed to Manchester to take the course of mathematical and natural philosophy in the new College recently established by Nonconformists to supply the growing wants caused by their exclusion from Oxford and Cambridge. As credentials of his future eminence, in addition to the promise held out by his career thus far, he took with him the revised proofs of his *Meteorological Essays*. There he continued to dwell for the fifty more years to which his life of intellectual labour and usefulness was prolonged.

The stages of Dalton's otherwise uneventful career are marked by the steps of development by which his new scheme of philosophy advanced towards consummation. But whilst the whole of his observations and philosophical researches converged towards this ultimate result, there was to be found in the subsidiary labours which varied his dull professional toil and supplied the material for his leading hypothesis scope for his untiring powers of reflection and reasoning, with results of solid and permanent value to science. Dr. Lonsdale's list of the papers read by him before the members of the Manchester Literary and Philosophical Society, not less than 116 in number, besides his contributions to Nicholson's *Journal* and Thompson's *Annals of Philosophy*, and to other scientific serials, in addition to his more substantial or systematic writings, prove what a fund of intellectual energy remained to him after the exhausting toil of daily teaching, tedious and depressing as the formal routine of a schoolmaster's daily duty must be beyond most other kinds of mental labour. Nor is the versatility of his mind less shown by the widely varied character of these papers. It was in the earliest of them, October 31, 1794, that he broached that memorable discovery in the theory of light and vision which sprang from his recognition in himself of the peculiar defect which has since been known by his name. The date of this discovery would seem to be marked by the anecdote of his purchasing for his mother in boyish days a pair of silk stockings at Kendal as becoming drab, which dame Deborah and the neighbours would have it were cherry-coloured. That his active mind had not slept over the oddity of the phenomenon appears from the statement of his biographer that both brothers, sharing the like infirmity, tested the vision of their scholars, and found in them a percentage of similar cases, which afforded some comfort in their sense of deprivation. In the days of his late-won distinctions, when flaunting his scarlet robe as an honorary D.C.J., of Oxford at Court, or amidst the University dons, he was spared the sense of its incongruity with his Quaker under garb. To the accompanying dulness to female charms is attributed the fact of Dalton's having throughout clung to single life, though it would be unfair to leave out of the account his slenderness of means until the falling in of his brother Jonathan's comparative fortune in 1834. More than one episode in his life and correspondence shows him to have been far from insensible to the attractions of pretty Quakeresses. That he was indifferent to the wealth which his rare powers of mind, not to speak of his actual discoveries, might have brought him, is

manifest in the simplicity, amounting to rudeness, which marked his mode of living. To foreign savants, like M. Pelletan, who made pilgrimages to the ideal shrine of science and learning at Manchester, he would show a roughness of manner as well as a penury of surroundings which was made up of pride as much as of native simplicity, whilst men set in the high places of scientific fame and emolument were aghast at finding a man of European name lodged like a peasant and overlooking a ploughboy ciphering on a slate. It was a minor burst of the same pride which led him to speak with undue contempt of the apparatus which helped him to his great discoveries. Though not a few of these were worked out with penny ink-pots and glass-tubes not costing a farthing each, and though he would speak of all the books he had ever read as what he could carry on his back, it turned out that his library contained upwards of seven hundred volumes, some of considerable value, and that his instruments filled a case of no mean proportions in the rooms of the Society of which he was so long the ornament and the light. It was not till 1822 that he considered it within his means to pay the fees required for the fellowship of the Royal Society; an honour which he had declined twelve years earlier on the score of poverty, though it has been thought that doubts of his election, with Davy so strongly opposed to his atomic theory, might have more to do with the refusal. It is certain that Dalton was wholly wanting in those graces of manner and of character which, with not less simplicity or independence, won for Faraday universal honour and affection. Self-willed and opinionated, so as to reject with scarcely an attempt to master them the facts or the formulae advanced by Wollaston, Berzelius, or Gay-Lussac, and bearish to a degree which forbade the kindly intercourse of civilized society, he was himself the main cause of the isolation or ostracism which has been unfairly charged upon the jealousy of rivals or the exclusiveness of fashion. Far from being many-sided, or from overcoming by dint of culture his native narrowness or rusticity of mind, he retained to the last the tastes and manners of the cottage; nor did any trace of historical or liberal reading of any kind show itself in his conversation or relieve the unadorned prose of his addresses, which gained nothing in music, whatever might have been their gain in strength, from his broad Cumbrian Doric. As an experimentalist he was neither elegant nor in any great degree successful. It was by rude strength of intellect and will that he beat out his conclusions, and made his way to the foremost rank among the original thinkers and discoverers of his own or any age.

Of Dalton's great discovery Dr. Lonsdale gives a very good popular sketch, showing how he was led to it by his observations on meteorology, in particular by his researches into the proportion of the several gases or elastic fluids constituting the atmosphere, with the result of the first clear conception of definite multiple proportions. How far he himself was conscious of guidance from the labours of others in the same field is to be seen from what Dr. Henry has given us of his father's minute of a conversation with Dalton, in which the philosopher speaks of what he owed to Richter's laws of reciprocal proportions or equivalents deduced from his experiments on the neutral salts. His own reading, though neither wide nor deep, would supply him with much material out of which, by a master stroke of constructive skill, he reared the fabric of what he not unjustly termed a new chemistry. There is no evidence that Dalton ever combined with his chemical researches the slightest study of electric or magnetic phenomena or laws; nor could he in consequence have anticipated such later developments of the law of molecular combination as have already brought light and heat and many effects of electricity, and now promise to bring chemistry, within one generalization, as modes of motion—chemical equilibrium having been shown by Professor Williamson to consist, not in molecular rest, but in a system of molecular movements in which decompositions and recompositions balance each other. As the first, however, to announce and to prove experimentally the universal law to which common consent has given his name, Dalton has established his claim to be considered, as his biographer calls him, a lawgiver of science.

LANGE'S HISTORY OF MATERIALISM.*

THE title of this book, which after a lapse of some five years has reappeared in a much modified shape, by no means fully indicates the nature of its contents. The first volume—all that has yet appeared—does indeed contain a history, and a very elaborate history, of Materialism from the very beginning to the time immediately preceding the appearance of Immanuel Kant in the philosophical world; but it contains a great deal more. Not merely has the examination of a particular series of tenets involved the investigation of opposing doctrines, not only has the author been copious with his biographies, but he has been careful to point out the special influence of certain scientific theories on different ages and countries, so that he virtually adds to the history of civilization a new chapter, extending over a long period of time. The subject likewise gains in extent from the circumstance that the thinkers who come in for the largest share of consideration are not only the materialists strictly so called, but the whole body of the empirists, whom Dr. Lange regards as co-operators

* *Geschichte des Materialismus*. Von Friedrich Albert Lange (zweite verbesserte und vermehrte Auflage). Erstes Buch. Geschichte des Materialismus bis auf Kant. Leipzig: Bader.

with the materialists in the furtherance of physical science. In his criticism as in his biography he is impartial to an almost irritating degree; he seems to sympathize with the materialists without being exactly one of them. What he is we do not exactly know; but at all events he is not a "realist" in the mediæval sense of the word; he does not in the least believe in "Universals," nor does he think that the book of nature is to be read otherwise than by experiment.

Ancient Materialism is neatly summed up in six propositions, which virtually contain the whole theory of Demokritos, and with which the student of Lucretius is of course tolerably familiar:—1. Out of Nothing arises nothing; nothing that is can be destroyed. Change is no more than combination and separation. 2. Nothing happens by chance, but all through a cause and by necessity. 3. Nothing exists but atoms and empty space; all else is mere opinion. 4. The atoms are infinite in number and infinitely various in form. In an eternal fall through infinite space the larger atoms, falling more quickly, bound upon the smaller; the side-motions and vortices that thus arise are the commencement of the world's formation. Infinite worlds are formed and perish successively and simultaneously. 5. The difference of all things arises from the difference of their atoms in number, magnitude, form, and order; there is no qualitative difference of atoms, neither have they any internal conditions; they only act on each other by external pressure and impulse. 6. The soul consists of fine, smooth round atoms, like those of fire. These atoms are of all the most mobile, and by their motion, which permeates the whole body, the phenomena of life are produced. By the side of this theoretical materialism grew up what Dr. Lange terms "ethical" materialism, a result of philosophical sensualism. What matter is to external nature in the former, sensation is to the inner nature of man in the latter. As the theoretical materialist derives the forms of things from the matter of which they are composed, the sensualist derives all consciousness from sensation. The two doctrines are apparently antagonistic to each other. The materialist, strictly so called, will deny that sensation can be separated from matter, and will regard every process of consciousness as the result of material operations not to be distinguished from those of the outer world. The sensualist, on the other hand, must deny that we have any knowledge of the outer world at all, inasmuch as we cannot get beyond our perceptions, and are without means of ascertaining the relations of these to any external entity. The six propositions of Demokritos given above, shocking as they appear when regarded from a religious point of view, have certainly a much less dreamy look about them than the idealistic theories of Plato. Nevertheless these atoms, which to the vulgar mind recommend themselves by their tangibility, signify nothing more than that unapproachable "Ding-an-sich" which Kant, who herein is at one with the sensualists, declared to be beyond the reach of human consciousness. This "Ding-an-sich" the consistent sensualist would as soon call a mermaid as an atom; and when Kant, herein differing from him, went so far as to maintain that it is not a mere nothing, and even dignified it with the name "Noumenon"—i.e. (*hucus a non*) something about which nothing can be known—he gave rise to a perplexity affording matter for discussion down to the present day. Nevertheless, in spite of this veritable antagonism, the materialists and the sensualists appear as staunch allies in the history of philosophical thought, and are attacked by a common foe, the atomic system being as repugnant to the Platonic theology as "ethical materialism" or sensualism to the Platonic code of morals. The legend that the Sophist Protagoras was the pupil of the atomist Demokritos, though perhaps not susceptible of historical proof, is not to be rejected with contempt.

Protagoras, the chief of those Sophists who were everywhere regarded as bugbears till they found an apologist in Hegel and advocates in Mr. Grote and Mr. Lewes, seems to have been the first man whose speculations took a subjective rather than an objective turn; and, in a certain sense, as Dr. Lange remarks, he is at the head of that movement against materialism in which Sokrates took so leading a part. Nevertheless the alliance between Sokrates and the Sophists ends as soon as it begins. If Protagoras, with his maxim "Man is the measure of all things," started from sensation and Demokritos started from atoms, there is this relation between them, that both regard the individual and not the universal as the essential entity, whereas the contrary doctrine was held by Plato. Much that passes for materialism now is in reality sensualism, and in support of this view Dr. Lange cites Büchner, who explicitly declares that things only exist for one another, and import nothing without mutual relation, and Moleschott, who still more explicitly asserts that, were it not for its relation to a perceiving eye, the tree would not exist.

The precise meaning of the expression "ethical materialism," which Dr. Lange uses as the moral equivalent for sensualism, is propounded by him thus:—

By "ethical materialism" we are to understand a doctrine according to which the moral action of man arises from his own individual impulses, and which determines the mode of action not by an unconditionally dominant idea, but by the effort towards a desirable position. Such a doctrine may be called materialistic because, like theoretical materialism, it starts from matter, not from form, although here we regard not the matter of external bodies, nor even sensation as the matter of theoretical consciousness, but the elementary matter of our practical relations, our impulses and our feelings with regard to pleasure and its opposite. It may be objected that this is a mere analogy, that we have here no evident unity of tendency. Still history almost everywhere shows us that this analogy is potent enough to determine the connexion of the systems.

We have dealt thus at length with a very small part of Dr. Lange's book because it shows the principle upon which the whole work is written. The theoretical and the ethical materialists are regarded as workers in a common cause, and pass before us in a procession which begins in remote antiquity and ends with the last century, accompanied by their opponents, whose presence, although they are less conspicuous, is found necessary to complete the picture.

When in his first section Dr. Lange has gone carefully through the progress of materialism in ancient Greece and Rome, devoting many pages to an analysis of the great poem of Lucretius, he carries on his record through a transition period which begins with the decline of ancient civilization and ends with Bacon and Descartes. In this section we have a brief history of Arabian philosophy and scholasticism, with reflections upon the influence of monotheism on natural science. The materialism of the seventeenth century occupies a third section, in which the principal figures are those of Gassendi and Hobbes, though Newton, Boyle, Locke, and Toland come into the record, the last being treated almost with affection. Strange as the fact may seem to some, England was the hotbed whence sprang all the infidelity that spread over France during the years immediately preceding the first Revolution, though it attained new forms in a new atmosphere, and, especially in the case of Lamettrie, assumed a tone of indecency unknown to it in its native home. Hence in the history of the materialism of the eighteenth century, which occupies Dr. Lange's fourth section, the leading chapter is appropriated to the influence of English materialism upon France and Germany, the latter country being at the time the most puritanical in all civilized Europe. In this section the works of Lamettrie and Baron von Holbach are described at great length, and in the description of the former especially the reader is supplied with much knowledge about a man whose labours earned him a bad name, and who even among students of his period is known by his name only. By his fellow-free-thinkers this pronounced Atheist was despised; and the orthodox found evidences of a "judgment" in the report that he suddenly died of indigestion after partaking too largely of a pheasant-pie *à la truffe*. Dr. Lange plainly makes out that Lamettrie was an original thinker and not a mere circulator of other people's thoughts. To the seekers for new information the chapters on Gassendi, Lamettrie, and Holbach will probably be the most interesting, because they present much which is not readily to be found elsewhere. Some who have not thought much on the subject will be surprised to find Voltaire so very mild a Deist that he looks almost orthodox among his companions. By his biographical information, most liberally given, Dr. Lange greatly enlivens his expositions of abstruse theories.

We are much tempted to notice in some detail the account of Lamettrie; but we feel that it would in a great measure be spoiled by abridgment, interesting as it is on account of its full details. As a specimen of the manner in which Dr. Lange connects the history of philosophy with that of civilization, we may recapitulate the substance of his remarks on the influence of Bacon and Hobbes upon England. This island, as already stated, was the home of modern materialism, and Dr. Lange would associate the great advance of England with the names of Bacon and Hobbes, as the French Revolution is associated with that of Voltaire. But in its speculative form it here destroys itself and gives way to practical pursuits. Atheistical as it might be in its tendency, it did not raise its hand in avowed hostility against ecclesiastical institutions. Epicurus, Lucretius, and many Frenchmen of the last century, strove to destroy religion as such, and this practical aim seems to have been among the chief purposes of their theoretical speculations. Hobbes, on the contrary, favours an established religion; "State and Church" (the usual order of the words being changed) is his leading maxim. Bacon and he have taught people to direct their energies towards the attainment of practical results, and their unconscious disciples follow in the prescribed path without troubling themselves about antecedent theories. Dr. Lange sums up as follows what he conceives to be the manifestations of Hobbism in the England of the present day:—

The upper aristocracy indulges in a personal free-thinking (*Freigeisterei*), coupled with an esteem for ecclesiastical institutions which is, or has become, sincere. The men of business regard all doubt respecting the truths of religion as "unpractical;" for the *pro* and *con* belonging to discussions relative to the theoretical foundations of theology they have no sense, and if they abhor "Germanism," it is rather because they have in view the security of life on this side of the grave than on account of any expectations in the life beyond it. Women, children, and sentimental folk (*Gewüthmenschen*) are unreservedly devoted to religion. On the other hand, in the lower strata of society, for the maintenance of which in their proper place a life of refined sentiment does not seem to be well fitted, there is scarcely any religion at all beyond the fear of God and respect for the clergy. The notion of natural philosophy (*Naturphilosophie*) has passed over into that of physical science (*Physik*), and a moderate egoism, which has admirably reconciled itself with Christianity, is acknowledged by all strata of society as the only foundation of morality, either for the individual or for the state.

Dr. Lange does not mean to say that this state of things, which he seems to regard with a sort of ironical admiration, is entirely due to the influence of an author so little studied by the "general reader" as Thomas Hobbes; but he considers that the doctrines of the philosopher and the life of his countrymen for nearly two centuries after his death wonderfully reflect each other—that, indeed, the reciprocity is now more complete than ever, showing that the old man of Malmesbury was somewhat of a prophet.

It should be stated that every section of Dr. Lange's work is

followed by a copious body of notes, abounding in references to authorities, and bearing ample testimony to the extensive reading of the author.

FRENCH POLITICAL CARICATURE.*

"I DO not know," says Count Réal in a book published in 1835, "if it will ever occur to a clever man to write the history of the French people by its caricatures since the institution of caricatures in France. Such a history would be neither less interesting nor less true than many of those with which we have been favoured for forty years past." This idea has occurred or been suggested to M. Champfleury, and he has used it to good advantage. In his present volume he starts with the condition of the Tiers État before and up to 1789. He remarks that the most curious point about the caricaturists of that period is the extreme variety of treatment which they brought to bear on the same subject. The sameness of the subject is a disadvantage. Men were filled then with one idea; and as in ordinary life there is nothing more tiresome than a man with one idea, so the contemplation of a series of sketches of past history, which have all the same motive becomes wearisome. The three figures of the noble, the priest, and the peasant, which are the stock in trade of the artists of 1788-1789, have changed the positions which they then occupied. It is difficult in these days of poor curates and wealthy colliers to sympathize with the continual glorification of the man with a spade at the expense of the man in a priestly robe. Thus, in spite of the care with which M. Champfleury has arranged and explained his specimens, the caricatures of the period with which his volume opens seem, as Lord Verulam says the reading of good books sometimes seems, "a little flat and dead."

A kind of meteoric shower of caricatures burst upon Paris after the 4th of August. The delight of the people at the enforced submission of the clergy and the nobility expressed itself in various forms of more or less extravagance. In some of the sketches of the time the three orders are represented embracing, playing music, or dancing together. It may be noted that in the case of the dancing the noble and the priest are made to bewail their fate in having to pay for the music. In others less kindness and moderation to the two orders is shown by the artists, whose sympathies were with the third. In one, called "Le Pressur," a corpulent priest is about to be put into a press, from which two other priests are departing in a singularly attenuated condition. A more violent version of the amalgamation of the three orders than that given by the sketches of their representatives singing and dancing together is found in the sketch entitled "Un Seul fait les Trois." Here the desired harmony is procured by the absorption of two out of the three into the peasant, who stands alone, dressed in a costume made from combinations of the priest's, the noble's, and his own. In another popular sketch the devil, who has been at all times of inestimable service to caricaturists, is represented being beaten off by a peasant, whose father encourages him with cries of "Frappe fort, fort, mon fils; c'est un aristocrate." For some time the Royalist party took no notice of the expressions of popular feeling by means of caricature, but passed them over with what may be called either a stupid indifference or a haughty disdain. It is curious that the first weapons employed by them in this kind of warfare were aimed at the Duke of Orleans and came from England. One of the first of these, which appeared soon after the 5th and 6th of October, represents the Duke hunting a crowned stag with hounds who have human heads, each of which is labelled with the name of one of the Duke's Court. The legend in English is, according to M. Champfleury, "Who kills first for a crown," which he oddly enough translates, "Une couronne à qui le tuera." In a French caricature of the same period the Duke is seen to have fallen in the mud. Chabron, one of his creatures, is trying vainly to wash him clean. On the ground is written, "Bastille, faubourg Saint-Antoine, poissonnerie d'Aiguillon, Mirabeau, baron de Menou." Decapitated heads are lying around, set off with pikes and daggers.

The chapter which contains an account of these and other like shafts directed at the Duke of Orleans concludes with a copy of a caricature entitled "Le Calculateur Patriote." This represents a man in the habit of a student or a sage studying his tablets in front of a table which is littered with human heads. There is more force in the drawing of this than is to be found in most of the productions of the time, and it derives additional interest from the fact that M. Champfleury professes himself unable to determine whether it emanated from the Revolutionists or the Royalists. In the next chapter M. Champfleury treats of Camille Desmoulins, and of Dussaulhey, who succeeded him as editor of the *Révolution de France et de Brabant*. It is curious that Desmoulins and his designer or engraver seemed to have worked independently of each other, for on the 20th of March in the first year of liberty the following paragraph appeared in Desmoulins's paper:—

Je proteste contre la gravure en tête de mon dernier numéro. J'ai déjà observé [sic] que je ne me métais point du frontispice et des figures, à l'exception de trois ou quatre dont j'ai donné l'idée.

On the 12th of April again he repeated his protest against the vignettes supplied to his numbers. It may have been due to the independent and self-asserting spirit of the age that writers and illustrators were thus curiously at odds. Illustrations in the

present day, however, have sometimes been observed to have no apparent reference to that which they are supposed to illustrate.

At the same time that Camille Desmoulins's journal made its appearance—that is, in November 1789—there appeared also a sheet devoted to the interests of the Royalists, having the startling name of *Les Actes des Apôtres*. This publication continued for two years—that is, for four months longer than its rival—during which period it must be said that it counted many editors for the two of the *Révolutions de France et de Brabant*. An amusing enough war was carried on between the two papers. On one occasion when the revolutionary sheet discovered that *aristocrate* was the anagram of *Lacuriale*, the Royalists retorted with an anagram which was both more forcible and more correct, reminding one of the *Never so mad a ladye*, which put to shame Dame Eleanor Davies's *Revel, O Daniel!* The Royalist paper seems to have held its own very well on the whole. Its editors for the most part touched their subjects with a light hand and in a light sceptical spirit. It is strange to find the defenders of royalty, personified in Louis XVI., speaking in those terms of the past royalty of Louis XIV.:—

Louis XIV. fut aussi surnommé le Grand parce qu'il aimait les grandes conquêtes, les grands édifices, les grands palais, les grandes femmes, les grands valets, les grandes perruques; cela ne l'empêcha pas de mourir bien petitement, après avoir éprouvé de grandes humiliations.

"No droit-on pas," observes M. Champfleury with clear perception, "un passage coupé dans Thackeray?" It is strange also that the *Apôtres*, having run their course for two years, were finally suppressed by order of the King. Their violence had overstepped all bounds. Wit was replaced by insult, discussion by invective and calumny. The author of *Histoire de la Caricature sous la République* is of opinion that these defenders of Royalty contributed in no small measure to its downfall. The violent brutality of words and figures employed by the opposite party is better known to the world. In treating of the furious outburst of popular indignation against the clergy in 1790-91 M. Champfleury exhibits a drawing, which will be found facing p. 120 of his book, the inscription of which is remarkable for the horrible extravagance both of its sentiments and its spelling. On the subject of these extravagances the author has some observations which are worthy of note:—

Ce sont ces violences qui font perdre à la caricature tout crédit auprès des esprits mesurés. Du moment où la haine remplace la malice, où la vengeance chasse le trait spirituel, la caricature devient la complice du pillage, de l'incendie et des massacres. Nous l'avons vu en 1871. Et ceux qui seront appelés plus tard à redire les excès de la Commune ne devront pas oublier le rôle des images, presque aussi puissant que celui des journaux.

The caricatures of that date are curious in this amongst other points, that they have given prominence to three men especially who would otherwise have enjoyed a deserved obscurity, Maury, Mirabeau cadet, and Espréménil. They appear constantly in the broadsheets of that day, figuring now as the types of the clergy, the Parliament, and the aristocracy, which were translated into Lying, Cheating, and Destruction; now as the personifications of Rage, Despair, and Envy. In a third drawing which is headed "Rien n'est plus certain, ils s'entendent à merveille," D'Espréménil is represented hanging, while Maury and Mirabeau cadet are making ropes for themselves under the direction of the inevitable devil, who was pressed into unusually heavy service by the caricaturists of this period. "A ces hommes," says the author, "la caricature rendit service; sans elle, ils n'existeraient pas." Mirabeau cadet, however, was already known as one of the editors of the *Apôtres*. The *émigrés* supplied the revolutionary caricaturists with plenty of subjects, and an amusing chapter upon these is followed by an interesting account of Boyer-Fruron or Boyer de Nîmes), the first historian of caricature in France. He was inspired by a blind hatred of Protestantism, and was angry with those of his party who threw all the terrible burden of the Revolution on the shoulders of the Freemasons, reserving none of it for the Calvinists. The persistence of his attacks upon the Revolution could have but one end, and he died for the cause which he had supported with all the energy of his pen on the 20th of May, 1793. A Mme. Costard who had loved him wrote exactly a year after his death to the Comité de sûreté générale de la Convention, asking to be condemned to death also, in a singularly touching letter, which is quoted at length by M. Champfleury. Among the names which are known by their possessors' savage attacks upon the King and Queen with pen and pencil, that of Villeneuve stands out distinguished by the unapproachable hideousness and dullness of his productions. He and his imitators, as the author says, more than justify such comments as these made by Mallet du Pan:—"Ces estampes se distinguent par un caractère particulier de platitude et de férocity. Rien de plus éloigné de l'esprit français et de l'humour qui rend très-piquantes les caricatures anglaises. Celles qu'on étale sur les quais rappellent les Vandales."

The most interesting part of M. Champfleury's book, in some respects, to English readers is likely to be that which is devoted to "La Révolution jugée par Gillray et Rowlandson." The author displays a keener appreciation than might be expected of the English artists' powers; inclining, as one would expect, to put Rowlandson above Gillray. He has probably been biased somewhat by his inclination in choosing the specimens which he has given of each artists' work. He has contrasted the very powerful, but very ferocious, drawing of Gillray's called "A Family of Sansculottes refreshing after the fatigues of the day" with Rowlandson's "Napoléon et la Mort." The one is marked by a savage force, the other by a sombre and majestic irony. It is noteworthy that there is a considerable likeness to the real man in Rowland-

* *Histoire de la Caricature sous la République, l'Empire et la Restauration*. Par Champfleury. Paris: Dentu.

son's Napoleon. Gillray's representation of him was always a merely arbitrary figure, which was no more like Napoleon than George III. Upon Gillray M. Champfleury makes some good observations, in one of which he falls into a curiously French blunder. The exaggerations of Gillray, he says, are on a large scale, like his flow of spirits, and like the colouring which he employs. "Le satirique semble un bœuf qui prétend faire rire le spectateur à coups de pied dans le ventre." This is an odd confusion between the English boxing-match and the French *savate*. The author institutes a comparison between the natures of Swift and Gillray, and the termination of their lives:—"Le peintre devient fou. Tel est trop souvent le lot de ceux qui analysent ou regardent de trop près les folies de leurs contemporains." In treating of the times of Napoleon the author takes occasion to make a violent attack upon Talleyrand and Cambacères, and preserves two grossly brutal *mots* of Napoleon's addressed to them, which had better perhaps have been omitted. On the whole, however, M. Champfleury must be credited with having avoided with much tact and skill the offensive side of his subject. We may conclude our notice, as he concludes his interesting and amusing book, with a very true maxim of Joubert's:—

Il faut, pour le mérite de la caricature, qu'elle soit traitée par un homme qui ait eu lui le type du beau.

ETCHINGS BY FRENCH AND ENGLISH ARTISTS.*

MR. HAMERTON, who writes the descriptive and critical notes to this handsome volume, has heretofore done good service in making the art of etching, especially in its less known phases in France, familiar to the British public. As editor of the *Portfolio* he has introduced into this country a class of work which, just in proportion as it was foreign to the practice of our English school, proved timely and serviceable. There is no doubt that we had much to learn; indeed it is acknowledged that the most skilful of etchers in this country, such as Mr. Whistler and Mr. Haden, are in style more identified with France than with England. And Mr. Hamerton, by the direction which his studies have taken as well as by the advantages incident to his residence on the Continent, is warmly appreciative of foreign schools, while as an Englishman he cannot be otherwise than loyal to what has truth and promise in it here at home. These "Twelve Etchings by French and English Artists" have been selected out of a miscellaneous multitude on the judicious principle of compromise. Little or nothing of that extravagance of genius which we are led to expect from Paris is permitted in these pages specially provided for the drawing-room table. Some of the plates indeed are even tame; thus a view on a canal in Venice by M. Léon Gaucherel has a painstaking manipulation, a crudeness in light, and a poverty in shade which appear to be simply the reverse of the qualities coveted and expected in the etcher's art. Again, we can scarcely understand why in a volume of this high character a place should be given to "The Orange Wharf, London Bridge," by Mr. Ridley. In no branch of art is it easy to excuse ugliness, and the accepted laws of drawing, symmetry of form, and harmony of line cannot be annulled even in the comparatively lawless art of etching. Intricate subjects of this kind—steamers and coasting craft along a quay unloading—have been of late perspicuously painted by M. Tissot, and in past years Mr. Whistler made his most brilliant triumphs among the broken-down tenements and the picturesque craft on the banks of the Thames. Mr. Ridley, though he has studied long, has much to learn; like another of our English etchers, Mr. Edwards, he fails to educe order out of discord, harmony from confusion. But Mr. Hamerton, in his capacity of editor, here and elsewhere has shown himself widely tolerant of diverse styles; by his impartiality he rises above suspicion of partisanship; he gives a kind word of encouragement when most wanted; his criticisms, always genial, are penned in the interest equally of art and of the artist.

The recent revival of etching throughout Europe is a sign of the times for which there may be various causes. The decline of the laborious and costly process of line-engraving, partly brought about by the intrusion of photography, left space and opportunity for a more facile and economical art. Moreover, there has grown up an ever-increasing demand for products which are at the same time satisfying to the artist and pleasing to, as well as within reach of, the public at large. Likewise, the number of executants fairly qualified is steadily on the increase under the wider diffusion year by year of knowledge and training. And etching has the advantage of lying on the frontier between professional practice and amateurism; the art in its highest manifestations taxes the utmost skill of the painter, and yet offers peculiar temptations and facilities to the *dilettante*. It is an extemporaneous mode of putting down ideas in black and white. The method once mastered admits of indefinite improvement which pleasantly chequers encouragement with disappointment. Indeed so fascinating does the pursuit become that we have known men who, stealing leisure from pressing avocations, have found in etching a recreation and enjoyment in the midst of a busy and anxious life. These and other reasons lead to the hope that the revival of which we have spoken

is not a mere freak of fashion, but the result of causes which may operate year by year in the way of further progress and higher development. Mr. Hamerton states the present position of the art as follows:—

The history of etching within the last two years is in some respects encouraging, but the encouragement is of a kind which would hardly have been foreseen at the commencement of the revival which took place all over Europe a few years ago. No thoroughly active and efficient school of original etchers has formed itself anywhere; a few men here and there practise the art as an original expression of their own ideas, but the really strong and accomplished school, the French school, is now almost exclusively occupied in interpreting pictures by others. Even Jules Jacquemart seems to have abandoned the marvellous original work that first made him famous, to engrave Dutch pictures with his etching-needle. Original etching is now chiefly the work of amateurs, for even when a painter takes to etching, he most commonly employs the art in copying something already done by him in water-colour or in oil, rarely developing an entirely new conception with the point. In the present series of twelve plates both kinds of etching are represented, for we determined not to exclude etchings from pictures.

Among the etchings from pictures there is no translation more free and forcible than that made by M. Laguillermie from a well-known portrait in Madrid by Velasquez of one of those little monsters—pocket editions of humanity—the dwarf kept in the Spanish Court. M. Laguillermie is the reverse of an amateur; the apprenticeship he served was long and thorough, and the pledges given of his talent are quoted as masterpieces. He obtained the Grand Prix de Rome; he studied in Italy, at Athens, and Madrid, in which last city "he engraved the famous 'Surrender of Breda' by Velasquez, and four other subjects from the same great master, of which this 'Dwarf' is one." The distinguishing merit in the plate is that it translates in a masterly way the characteristics of the great Spanish painter, that "masculine, plainspoken, vigorous realist, who was disdainful of everything but his purpose." The plate before us Velasquez himself would have approved; indeed, had the master been an etcher, we should have expected from his hand a work thus trenchant in touch, broad in deep monotone, and grand in sketchy, suggestive negligence.

The best French etchers do not allow themselves to descend to a finish which is childish, or a prettiness affecting sentimentality, and in this the school is distinguished from the English; but of late, as we have said, the two schools approximate. Many indeed are the changes here and on the Continent; in fact, the revival of which we have spoken has taken the character of a revolution; old methods are broken down, and the divers modes of engraving practised formerly, especially that of "the pure line," have at length exchanged servitude for freedom. Accordingly Mr. Hamerton rejoicingly writes that "few things in the recent history of the fine arts are more hopeful and encouraging than the emancipation of engraving, and its nearer approach to thoroughly artistic painting." This change for the better has in a good degree been brought about by etchers, many of whom are painters cognizant of the value of colour, of the vital relation between intention and touch, and of the means of giving true expression to an artistic idea through varied light, shade, and manipulation. The line-engravers of Italy, compared with the etchers of France, work as dull mechanists in geometric curves and lozenge shapes. In contrast the plate before us has the life and go of a sketch, the freedom of an extemporaneous effusion, and this little Dwarf seated in a heap on the ground with a book on his knee and an inkstand at his feet lives as a real presence. The portrait is so speaking as to move Mr. Hamerton to a piece of pathos not unworthy of De Quincey or Charles Lamb:—

Amongst the personages who interested King Philip IV. most were the poor ungainly dwarfs with whom the temper of human grandeur at that time loved to surround its own sublimity for the pleasure and advantage of a contrast altogether favourable to itself. But there were differences among the dwarfs, which Velasquez perceived with his keen, artistic intelligence and profound observation of mankind. One of them was merely silly, another scowled hatred and envy from under his beetling brows, but this one whose image is here before us bears the pain of a nobler suffering. O sad and thoughtful face, looking out upon us from the serious canvas of Velasquez, though the grave has closed upon thee for two hundred years, we know what were thy miseries! To be the butt of idle princes and courtiers, and, worse than that, to be treated by the most beautiful women as a thing that could have no passion, to be admitted to an intimacy which was but the negation of thy manhood, to have ridicule for thy portion and buffoonery for thy vocation, and yet to be at the same time fully conscious of an inward human dignity continually outraged, of a capacity for learning and for thought! All this was enough indeed to drive thee to noble follies, that give thee some sense of human equality, some intellectual fraternity and consolation.

How French etchers can vary their style according to the changing sentiment of the subjects treated is apparent in M. Flameng's brilliant yet tender plate taken from a picture by Bonington, "Francis I. and the Duchess of Etampes." The art of M. Flameng may be compared to the notes of the mocking-bird that imitates the varied songs of the forest. His style changes to meet the manners of the most opposite masters. Thus in Paris, Vienna, and London we have observed plates by this artist heavily loaded with ink as the pictures of Rembrandt are with paint, and, on the other hand, we have encountered engravings thin in texture but intelligent and precise in drawing, as suited the classic creations of M. Ingres. M. Flameng, trained in the Italian school of Calamatta, became qualified to reproduce Da Vinci, but as a Frenchman he naturally placed his talents also at the service of MM. Delacroix, Prudhon, Cabanel, and Bida. "The Bible" designed by M. Bida, and in part engraved by M. Flameng, has been recently reviewed in our columns. In the plate now before us this dexterous and versatile etcher throws

* *Twelve Etchings by French and English Artists: Flameng, Bodmer, Lucas, Laguillermie, Feytaud-Perrin, Ridley, Balfourier, Legros, Chittock, Grez, Lalanne, Gaucherel.* With Notes by Philip Gilbert Hamerton, Author of "Etching and Etchers." London: Seeley. 1874.

himself into the deep and resonant harmonies and romantic sentiment of Bonington, himself a devotee of the Venetian school. He is able through the cold medium of black and white to convey the idea of warm colour, and by varied intensity in light, shade, and texture he gains the relief of roundness and the sense of space. This etched picture of the "Visit of Francis I. and the Emperor Charles V. to the celebrated Duchess of Etampes" has been fitly chosen as a frontispiece to the volume.

Other plates might be quoted, did space permit, as illustrating "the versatility of etching, and its adaptability to the most opposite kinds of artistic expression." Thus M. Carl Bodmer produces a pretty plate of "Peacocks"; Mr. Horatio Lucas, an English amateur, picturesque buildings at Le Mans; M. Adolph Balfourier, a French landscape artist, some paintable materials he met with in Spain; while Mr. Chattock, an Englishman, by virtue of a fine study of tree-trunks and branches, is introduced by Mr. Hamerton with the just encomium that "few etchers have made more decided progress during the last few years."

On the whole, the advantage seems to be on the side of etchers who do not copy or interpret the ideas of others, but who create their own subjects. The reason is sufficiently obvious; in the last alternative, the relation between the creative mind and the executant hand becomes inseparable and absolute. There is, too, a subjection and servitude incident to copyism which cannot but prove inimical to the freedom of the etcher's mind and hand; whereas in the act of creating anew the imagination is moved to an ardour which communicates fire to the fingers, purpose to the pencil. There is a picturesque group by M. Feyen-Perrin of a mother and child seated on a sea-shore, absolutely perfect in the unison between the sentiment and the treatment. Equally inimitable in its way is a study, singular for fidelity, of peasant women of Roulogne by M. Legros, a French artist long known in our English Academy by an uncompromising naturalism. Many will prefer the painter's etchings to his pictures. Taken for all in all, this French rustic school is unapproached for its realism and simplicity, and Mr. Hamerton justly points to the strangest of anomalies, that in the midst of French work fatal for fashion and affectation, there have sprung up painters and etchers so remarkable for the entire absence of affectation "that their simplicity is more simple than ours, and their directness more direct." Yet, judging from the plates here produced, and from others we have seen elsewhere, especially in the exhibition of Mr. Whistler's collected etchings, we hold firmly to the belief that England will not for long lag behind France.

THE LATIN YEAR.*

TO those who have given much attention to the study of our national hymnology it will be no secret that between the compositions of such men as Toplady or the Wesleys and the other extreme of bathos there is a gulf full of very indifferent stuff. The worst of this doggerel fortunately seldom finds its way into print, except as an example of absurdity, as in the case of that wonderful production with which the clerk of Wesley's father startled the congregation one Sunday:—

King William has come home, come home,
King William home has come!
Therefore let us together sing
The tune that's called "To D'um."

But apart from such outrages on sense and sound, there are in use a great many tame and tasteless hymns uninspired by any clear and distinguishable keynote or pervading thought. The more earnest and introspective of our hymn-writers have often lacked or undervalued scholarship; and it would seem that, on the other hand, those who have possessed it have too little realized the hints and materials which it brought within their reach. The publication of *Hymns Ancient and Modern* has no doubt helped to raise our standard and to introduce life, and taste, and variety; yet even now it is seldom that we find a good harvest hymn or festival hymn written to order. The hymn written for the recent Charterhouse Chapel dedication was better than might have been expected, though rather negative than positive in merit; but its best point, representing the Carthusian "domus" as

A station towards the eternal home,
The house not made with hands,

betrays a lack of finish. The remedy for crudeness in hymn-writing is to be sought, we are persuaded, in a closer familiarity with the spirit, manner, and matter of the ancient and mediæval hymns, with which it is astonishing to find how little even our educated countrymen are really acquainted. Not long ago we read in an antiquarian periodical (we do not vouch for the fact) that the five volumes of Daniel's *Thesaurus Hymnologicus* are not yet in the British Museum, and yet the first volume was published in Germany in 1841, and the fifth in 1856. An introduction to the study of these volumes was Dr. (now Archbishop) Trench's *Sacred Latin Poetry*, first published in 1849, and now in its third edition; and English hymnology is greatly indebted also to Dr. Neale for the many pearls of mediævalism which he has re-set in his mediæval hymns and sequences. Till these are mastered and utilized it is lost labour to recommend Mone's *Hymni Latini*

Medii Ævi, a stiffer, and, to our thinking, a less remunerative, work.

High praise is due to the scholarly and judicious editor of the *Latin Year* for the skill and taste evinced by him in carrying out the task, which he has at length completed, of furnishing those who can read Latin sacred poetry with choice Latin hymns for every Sunday and holyday of the Church's year. We are not prepared, however, to say that he has not taken from us one attraction of his earlier instalments by furnishing at the end of Part IV. an index pointing to the sources of each and every hymn, and thereby establishing as modern imitations some which we might have still believed mediæval, and *vice versa*. The *Latin Year* is not only a welcome addition to the churchman's study and library-table—a sort of "Sunday book" to make a familiar friend of rather than a severe taskmaster—but a standard of what hymns should be, and a model on which to mould them. The form and shape so easily and gracefully assumed by the modern English hymns in these pages seem to indicate that they had an original affinity to the Latin in which they reappear; and the mediæval hymns themselves offer an inexhaustible field for translation or paraphrase, the results of which must be a gain to English hymnology.

We propose to glance at some of the rarer mediæval gems which these collections bring to the front, and afterwards to notice two or three of the happiest imitations of Latin hymnody by our own translators. Not many of the former are traceable to very remote antiquity. After the very complete little Hymn for the Epiphany beginning "Tribus signis Deo dignis," attributed by some to a monk of the ninth century, and the remarkable hymn "Jesu mi dulcissime, Domine celorum," attributed to St. Anselm of Lucca, A.D. 1086, and one or two pieces assigned with faint grounds to St. Bernard of Clairvaux, there is nothing much earlier than the extracts from St. Bernard of Morlaix in the twelfth century. His long poem "De Contemptu mundi" (recently republished in Wright's *Anglo-Latin Satirical Poets*) furnishes the third portion of the *Latin Year* with matter for three festivals, and is the original inspiration of Dr. Neale's "Jerusalem the Golden." Of about the same date is a Hymn of the Seraphic Doctor, Bonaventura, beginning "Recordare sanctas crucis," and breathing, as we observe Archbishop Trench has testified, "the richest personal familiarity with all the deeper mysteries of that spiritual life of which it speaks," as well as exemplifying the inexhaustible conceits and change-rings of a favourite mediæval hymn-type. It is quite a study of versatility, as well as a mine out of which to dig pregnant thoughts and fancies for modern use; whilst the ease which pervades it should be the ambition of whoever would infuse into English hymnology the ease as well as perspicuity of the Latin models. More symbolical, if not more mystical, is the poetry of Adam de St. Victor—in Dr. Trench's judgment the greatest Latin hymnologist of the twelfth century—which Mr. Loftie lays under contribution for the fine hymn beginning "Stola regis laureatus," on St. Bartholomew's Day, and the equally striking "Hæri mundus exultavit," which connects the festival of the Proto-martyr with that of his Lord's Nativity. Just as in Bonaventura's hymn there is almost a surfeit of happy conceits and similes for the cross, so here the poet, taking the converse process, shows how to touch one chord, and one only, for effect; and demonstrates the possibility of treating the common resource of a play on words in such a manner that it shall be neither trivial nor inopportune. Readers of St. Augustine may remember his play on the names of Vincentius and Victor. Here they will see the Latin synonym of Stephanus turned to account with true mediæval gusto. We quote Mr. Loftie's third stanza, adding, as we are fortunate in being able to do, Dr. Neale's English:—

Testis tuus est in cadis,
Testis verax et fidelis,
Testis innocentie,
Nomen habes Coronati,
Te tormenta decet pati
Pro coronâ gloriæ.

Lo! in Heaven the witness liveth;
Bright and faithful proof he giveth
Of his martyr's blamelessness,
Thou by name a crown impliest!
Meetly then in pangs thou diest
For the crown of righteousness.

We are constrained, however, to regret that for some unknown reason the editor has omitted the next and complementary stanza beginning "Pro coronâ non marcenti," which will be found in Dr. Trench's second edition, and which is translated in Neale's *Mediæval Hymns*. *Apropos* of Adam of St. Victor, it may be remarked that there is an abundance of rich poetic material in the two volumes of his poetry published by L. Gautier (Paris, 1859).

Noticeable amongst other original Latin Hymns in this collection are those for the Festival of the Baptist which Daniel styles "carmen poetica virtute valde eximium"; for the Thirteenth Sunday after Trinity, beginning "Attolle paullum lumina," a hymn of the sixteenth or seventeenth century; and another for the Third Sunday in Advent, referred by Daniel to the fifteenth century, and peculiar on account of its sectional rhyme which Neale has happily reproduced. It is suggestive of further experiments, and, as it stands, forms an almost perfect little hymn, the first line being "Tandem fluctus, tandem luctus." A like metrical experiment is the pleasing hymn beginning "Ut jucundas cervinus undas," based on the Forty-second Psalm, and erroneously referred to

* *The Latin Year: a Collection of Hymns for the Seasons of the Church, selected from Mediæval and Modern Authors, Part III.—Trinity, Part IV.—Advent and Christmas.* Edited by the Rev. W. J. Loftie. London: B. M. Pickering. 1874.

St. Bernard. Compact, simple, vivid, it makes an exquisite model, but we would counsel the editor to be more chary of punctuation, which sometimes impedes the sense, as in the last verse:—

Pacem donas et coronas
His qui Tibi militant;
Cuncta leta sine mota
His qui Tecum habitant.

It is simply cruel to put commas after "donas" and "coronas" in v. 1, and so to risk the chance of a doubt whether "coronas" is coupled by "et" to "donas" or "pacem." By the way, we observe that one or two faulty readings or misprints in the first instalment, which we noticed in a former article, have been set right in the index or appendix. Before we quit the original portion of these collections we must not fail to note that perhaps the very latest original Latin hymns in the whole range emanate from living scholars; the veteran Dr. Kynaston, whose "Huc adeste Galilæi" (St. Andrew's Day) is instinct with the very spirit of mediæval hymnody, and might well pass for an antique; as might also one or two originals by Mr. J. Addington Symonds.

By a kind of transition stage between the original Latin hymn and the revestiture of the English hymn in imitative Latin rhyme, these volumes give one or two compositions somewhat akin to the hymn based on the Forty-second Psalm, to which we have referred above. One, in eight-syllable complets, with a refrain in six syllables, is from Neale's "Sequentiæ ex Missalibus" ("In exitu Israel"), and shows great judgment in its manipulation; so much so indeed that it might well be mistaken for a mediæval hymn. Next to it, and from the same hand, that of Mr. Beresford Hope, comes a paraphrase of the Hundred and Thirtieth Psalm, which was first printed thirty-three years ago in the "Arundines Cami," but has been largely retouched for the present work. We cannot find space for exhibiting the variants of the earlier and the later copy: but one or two stanzas may suffice to show that skill and polish may survive the academic period, and, under favourable circumstances, wax rather than wane with years. There will be no need to do more than cite the Latin:—

Si Sionis obdiescat
Artem, dextera, negato;
Templi si non remineat
Lingua hæret palato.
Memor esto thorum
Deus, Edom, cum Sionem
Atrox virtus Chaldeenum
Vortit in oblivionem.
Qui dicebant "Devastate
Solymarum ornamenta;
Et cum solo adequate
Usque subter fundamenta."

Mr. Loftie sets before his readers such an array of translated hymns by such eminent hands as Canon Pearson, Mr. Robinson Thornton, Mr. Coutier Biggs, Mr. J. A. Symonds, Mr. Godfrey Faussett, and Dr. Kynaston, that citation of one more than another might seem invidious. Mr. Faussett's translations are extremely happy, and we are promised a complete volume from his pen. We are not quite sure, however, that we are satisfied with the third verse of his fine rendering of "The Son of God goes forth to War." Does "Signi rubor fulget latus" supply a distinct and perspicuous equivalent for "his blood-red banner streams afar"? In one of Canon Pearson's versions—a translation of Cædmon's "Bread of Heaven, on thee we feed"—we stumble on a feeble rhyme in stanza two—

Vera vitæ, sanguis trux
Allet calicem effusus—

but his rendering of "Jesu, Lover of my Soul" is all that could be wished. Any one who would prove how much more naturally such a hymn as Keble's "The Voice that Breathed o'er Eden" will run into eight-syllable Latin rhymes than into classical alcaics has only to contrast Dr. Kynaston's "Quæ beavit Paradisum," in pp. 291-3 of the *Latin Year*, with Lord Lyttelton's version after the manner of Horace in Mr. Coutier's *Hymns Ancient and Modern annotated*. Nor is Dr. Kynaston less successful in turning a not easy hymn by Charlotte Elliott, "Just as I am, without one plea." To him indeed, or to Mr. Symonds, we should, if driven to a selection, adjudge the palm. The latter is happy in rendering "Hark, the herald Angels sing," and still more so in clothing anew the beautiful verses of Keble's Evening Hymn, of which we subjoin the concluding stanzas:—

Mecum sis sub ortu solis
Ad occasum: nam si nolis,
Vivere tum nequeo;
Mecum sis cum nox propinquat;
Nam si Tui lux me linquat
Mori jam perhorreo.
Lucis Rex et tenebrarum,
Inter iras procellarum
Arcem tuam sospites;
Nam sub hiemis adortu
Ecce sumus nos in porta
Naven s' Tu diriges.

It simply remains to add that the *Latin Year* is admirably printed and illustrated. We should recommend those who invest in it to bind the four parts into one interleaved whole. Its value might be enhanced, and the stock of vernacular hymnology augmented and enriched, by well-advised translations from such of the pieces as are not already translated.

JUDITH GWYNNE.*

IF novels were supposed to give a true picture of real life, there would be something admirable in the boldness of the people who still venture to employ governesses. The governess of fiction is almost invariably either a suffering angel or a designing minx. Of course there are exceptions to this rule, and we have a faint recollection of one story in which the governess turned out to be a sort of ghoul or vampire, and of another in which she was a ticket-of-leave woman. But, as a rule, the types of minx and angel predominate, and it is difficult to determine which of the two is the less desirable addition to a family circle. It is painful to be compelled to suspect that the demure and dove-like trainer of the children is really looking down on her employers from the summits of superior culture, and is registering all their failings in her journal or in letters to her friends. On the other hand, the designing girl is a more obvious danger. The novel-reading matron may well tremble at the thought of her own daughters being eclipsed, and of the air in her neighbourhood being "clouded with colonels" attracted by her fascinating governess. Judith Gwynne, the heroine of the novel which is named after her, is not a young person whose history is likely to reassure the timid mother. She is not exactly a suffering angel, and when her employers are rude to her, she replies with clumsy but vigorous sarcasms. Nor would it be at all fair to call her a minx. An excess of maidenly boldness, on the other hand, is Judith's chief characteristic. For instance, when one of her numerous admirers tells her that he still loves her, though he cannot afford to marry her, she behaves in a very open and straightforward way:—

A great glow of warmth swept through her yearning bosom into her aching heart, her lustrous eyes dilated with a dewy softness as the coming tears gathered beneath the blue veined lids, and there was a choking sensation in her slender throat as she quickly cast her white arms around his neck, and hurriedly kissed him on either cheek. Then exclaiming, "Thank you, dear Norman, for these last words; God bless you for that assurance," she hurried away, suffering under a revulsion of outraged modesty, and sweet confusion, and maidenly trepidations at the bold act of which she had been guilty.

Judith has several opportunities of conquering any tendency to maidenly trepidation. She succeeds tolerably well when she offers herself to a lover whom she had previously rejected, and when she embraces a farmer who had beaten a man for being rude to her:—"She hugged him close, and kissed his bronzed cheeks till they tingled with unwonted fires." "Afterwards," however, we are told "she never would believe that she had been guilty of such unseemly conduct." Obviously there was no artifice in Judith. Her employers at worst had only to fear that her pupils might grow up paragons of the modern virtue of maidenly frankness.

Judith Gwynne is a novel of complicated social intrigues of the sort which only exist in novels. To make such a story readable the author must have some slight knowledge of society, and a share of the genius of Balzac and Richardson. Unluckily the writer of *Judith Gwynne* has none of the qualities of these writers, except a little of their longwindedness. The commonest observation, the most elementary knowledge of life, would have prevented him from contriving a plot so feebly impossible as that of this story. The heroine, when we first make her acquaintance, is governess to the children of a certain Farmer Noagood. She has "demure, dove-like eyes," which are veiled by "a silken cloud" of eyelashes, and when she giggles she "keckles a tiny laugh." She had left the house of a lady of rank, and had sought the home of the lowly farmer, to escape from the attentions of Colonel Wilnot, who was too poor to marry her. Colonel Wilnot is the author's conception of a gay and selfish man of the world. His conversation mainly consists of cynical descriptions of his own meanness, and indifference to false pride, in the pursuit of an heiress. It is scarcely credible that any woman would tolerate his impudent addresses, yet, such as he is, Judith loves him. But a rival to the Colonel appears in the person of honest Tom Frauleigh, the local attorney. Tom, however, was extremely boorish, and, though Judith gave him what she calls "a mess of pity and gratitude," he would never have been dangerous to the Colonel's peace of mind had he not saved her life when she set the farmhouse on fire. This escapade is told with considerable power, and indeed the author is at his best on the few occasions when he describes action of any sort. Thus, when Farmer Noagood beats an impossible lord and guardsman who has tried to kiss Judith, the affair is really what used to be called a spirited rally. And when Tom Frauleigh assaults another ruffianly peer, as also when he fights a bookmaker, he bears himself with very great courage and distinction. Perhaps the episode of the fire is best suited for quotation, in the present decline of the art of self-defence:—

Judith slept on in a kind of heavy stupor, until vague horrors began to wander ghost-like through the empty chambers of her brain, and her slumbers were woven through and through with intangible dreads of palpable dangers. Yet she could not for a long time shake off the leaden weight of weariness pressing so heavily on all her faculties, and it was not until a horrible sense of suffocation got hold of her throat, causing her to feel choking, that she awoke with a great start, and sought, still half unconscious, to push away this weight that prevented her breathing. Then a dull sense came over her mind that the candle was burning with unusual brightness, and in some extraordinary way was giving forth strange wreaths of heavy smoke and a great heat scorching her cheeks; and then of a sudden she woke to the full consciousness of the room being on fire, with

* *Judith Gwynne*. By Lisle Carr. Second Edition. 3 vols. London: Henry S. King & Co. 1874.

the window curtains and drapery all of a blaze, and fiery tongues of flame running along the worm-eaten roof-beams, enveloping one side of the room in dense smoke-clouds, giving forth darts of fire, and cutting off the only door of the room from all means of access.

From this dangerous position Mr. Tom Framleigh rescued Judith, but was himself severely burned. As the farmer was almost ruined, Judith became governess to the children of the local Squire, a Mr. Galton, whose wife was a cousin of Colonel Wilmot's. Mrs. Galton was a vulgar and weak-minded woman, who was jealous of the Colonel's attentions to her governess. It was therefore with pleasure that she welcomed Mr. Framleigh when he came to thank his fair nurse. The attorney is described thus:—

The hero appeared, dressed in glossy and creasy broadcloth much smelling of the tailor's shop, carrying a brand-new hat in a vague kind of way, as if he did not know how it got into his hands, and would be greatly obliged if any one would accept it as a gift, and bowing generally all round until his face flushed purple with nervous excitement. Of course Judith ought not to have noticed such trifles in the man who had saved her life; nor ought her quick eyes to have remarked the hair, all be-plastered with pomatum, the aggravating curl in each shining whisker, the demonstrative vigour with which he tugged at his gloves, and the shambling, bagman-like manner in which he carried himself.

Judith did, however, observe these defects, and Mr. Framleigh went up to London to drown his sorrows in amusement. To detach the Colonel from Judith, Mrs. Galton made her husband take her to town also. The Colonel set himself to ruin Tom's character, introduced him to society where he soon learned to disport himself with elegance, and, above all, cast him into the toils of Miss Lina St. Clair, whom he thus described:—

Lina St. Clair is miles above the common run of actresses. She has beauty, like most of them, but it is natural and very spiritual in its style; whilst in addition she has wit, good taste, decided genius, and an originality compelling her to single out a path for herself through the world.

The artistic path singled out by this genius was that of a dancer in burlesques, in "a short sky-blue tunic, ermine-bordered and silver starred, scarlet boots bearing tinkling bells, pink fleshings, and a great diamond star flashing forth its rays from the gloomy masses of her raven black hair." Mr. Framleigh had not un-naturally expected that the abode of this bright being would prove a "gaudy and tinselled place." Far from being gaudy, the boudoir of Lina had lavender-tinted Venetian blinds, "hangings of light blue and silver all round the walls and windows; cobwebby lace festoons here and there in aerial clouds," and so on. If Tom did not consider this splendour gaudy, his taste must have been as simple as the Scotchman's who, in buying a handkerchief, asked for "none of your bright colours, but just plain red and yellow." It is not very obvious how the subdued glories of Lina's villa were paid for, as she was a model of propriety, and had no revenue beyond what she gained by dancing in pink fleshing. However this may be, she loved Tom Framleigh, who would perhaps have yielded to her fascinations had Judith not written to him with her usual maidenly frankness, and ordered him back to Rishborough. She had been left a large fortune by an aged admirer, and as she had dismissed the Colonel from her mind, the course of Tom's love might have run smooth. But the Colonel was now in earnest about Judith's money, and the third volume is devoted to the tedious intrigues in which he plays off Lina against the governess. He introduces the *dansette* to the respectable Mrs. Galton, who is only too happy to ask this glory of the British stage to her house in the country, where she might win back the curled attorney. But his contending passions had stretched Mr. Framleigh on a bed of sickness, where Judith was nursing him. When he recovered sufficiently to recognize her, "she seized his giant claw between both her warm little palms, and said, in those soothing accents which come natural to women from their doll-days to their times of baby-bliss, 'Rest, dear Tom, rest, for I will not leave you again.'" And in point of fact she did not leave him alone till they were happily married. Lina, who was rapidly dying of an illness brought on by unrequited affection, enlightened Judith about the wiles of the Colonel. Judith punished that warrior with much maidenly boldness. She requested him to shake hands, and congratulate her on her engagement, and then met his salutation "with pitiless laughter." "Pray offer what I refuse—not for the first time, is it, Colonel?—to some girl who will appreciate the honour."

The humorous characters in *Judith Gwynne* are worthy of the serious persons, and of the plot. The most exhilarating portrait is that of Farmer Nosgood. He has more than Mr. Tulliver's helpless inability to understand the world, but his quaintest peculiarity is his habit of sacrificing a pig in moments of perplexity or of delight. Thus when the presence of the Colonel at his house excited his jealousy, he "vowed that the fattest pig in the sty should be given to the poor as an expiatory sacrifice." And when he heard of Judith's marriage, he exclaimed, "God's uncommon good to us, and bust me if I don't kill the black pig." Such a survival of the instinct of sacrifice may be interesting to the student of primitive culture, but it is scarcely good enough to furnish all the humorous side of a novel.

The grammar of *Judith Gwynne* is perhaps rather above the usual level of novelist's English. At any rate we have not noticed many such sentences as the following:—

The letter was written according to his dictation, and in due time reached the recluse of Rishborough, causing him an attack of such bitter self-reproach, as would have grievously sorrowed whilst pleasing the writer, had she known the effect of her words.

Long words rather puzzle the author of *Judith Gwynne*, and it is

probably only in certain religious communities that conservatism is synonymous, as he seems to suppose, with iconoclasm. Until he can make more use of his talent for describing action, and can develop the perplexities of his heroines among more probable surroundings, his novels are likely to produce what he calls "trances of dull inattention."

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 58 Boulevard de Strasbourg.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

Now ready, VOLUME XXXVII., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

SCHOLARSHIPS IN SCIENCE.

Two Scholarships in Science have been founded at St. Bartholomew's Hospital:

1. An Open Scholarship of the value of £100, tenable for one year, to be competed for in September. The Subjects of Examination are Physics, Chemistry, Botany, and Zoology. The Successful Candidate will be required to enter at St. Bartholomew's Hospital in October next.

2. Preliminary Scientific Scholarship of the value of £50, tenable for one year, to be competed for in October next, by Students of the Hospital of less than six months' standing. The Subjects of Examination are identical with those of the Open Scholarship.

For further particulars and syllabus of subjects, application may be made, personally or by letter, to the WARDEN of the College, St. Bartholomew's Hospital.

UNIVERSITY of LONDON.—MATRICULATION and PRELIMINARY SCIENTIFIC EXAMINATIONS.

SPECIAL CLASSES for these Examinations are held at St. Bartholomew's Hospital. The Classes are not confined to Students of the Hospital.

A Class for the Matriculation Examination is held twice in each year, from October to January and from March to June.

A Class for the Preliminary Scientific Examination is held from January to July. For particulars application may be made personally, or by letter, to the WARDEN of the College, St. Bartholomew's Hospital.

NOTICE.—ROYAL SCHOOL of MINES, Jermyn Street, London.—THE TWENTY-FOURTH SESSION WILL BEGIN ON THURSDAY, October 1. Prospectuses may be had on application.

TRENHAM REEKS, Registrar.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.

Incorporated by Royal Charter, 1853, for the General Education of Ladies, and for granting Certificates of Knowledge.

Patrons.

HER MAJESTY THE QUEEN.
H.R.H. the PRINCESS OF WALES.
VICTOR.—THE LORD BISHOP of LONDON.

Principal.—The Rev. J. L. DAVIES.

The CLASSES will re-open for the Michaelmas Term on Monday, October 5. Individual instruction is given in Vocal and Instrumental Music. Special Classes are formed for Greek and Conversation in Modern Languages. Boarders are received within the College walls by Miss Wood. Prospectuses may be had on application to Miss PARRY, 54 Wimpole Street, W.

E. H. PLUMPTRE, M.A., Dean.

QUEEN'S COLLEGE SCHOOL, 43 and 45 Harley Street, W.

For GIRLS from Five to Fourteen.

The CLASSES will open for the Michaelmas Term on Monday, September 28.

Prospectuses may be had on application to Miss PARRY, 54 Wimpole Street, W.

E. H. PLUMPTRE, M.A., Dean.

HYDE PARK COLLEGE for LADIES, 115 Gloucester Terrace, Hyde Park.

The JUNIOR TERM begins September 18.

The SENIOR TERM November 1.

Prospectuses, containing Names of Professors, Terms, &c., may be had on application to the LADY-BURGOYN.

LADIES' SCHOOL, TAUNTON, for the DAUGHTERS of GENTLEMEN.

The Education given is a thoroughly sound one, and the assistance of experienced Masters is procured in the study of those branches of learning which are often omitted in the Education of Ladies. The real work done is tested by the College of Preceptors and the Oxford Local Examinations, and by Examinations in the School itself. 7 Pupils passed the Senior Oxford, and 6 the Junior, in the June Examinations, 1872-73, and at the Christmas Examinations of the College of Preceptors, 17 Third-Class, 14 Second-Class, and 5 First-Class, including Special and Honour Certificates, were gained by the Pupils; and the College First Prize for English Literature at both Examinations was awarded on application to Miss REED, Mary Street House, Taunton. The next Term will begin on September 17.

CRESWELL LODGE, Grove Park, Chiswick, W.—Mrs. and the Misses EVANS receive a limited number of YOUNG LADIES for EDUCATION, on a plan combining the comforts of a private family, with the advantages of a few select companions in study. The next Term will commence on September 22. Professors of eminence attend.

EDUCATION.—A SWISS PROTESTANT LADY, who receives Four YOUNG ENGLISH LADIES for Board and Education, has a VACANCY. She resides in a spacious country house a mile from the town of Zurich, where excellent Music, Singing, and Drawing Masters can be had. She teaches French and German, which are constantly spoken during the long hours in Harz and Paris, and Italian, and can offer all the comforts of a refined home with the advantages of a school. Address, Mrs. FRIEDMAN, Somerleyne, Wells, Somerset. References: The Very Rev. the Dean of Norwich; the Rev. Sir Henry Manning, Bart., Horton House, Northampton; the Rev. J. Farquharson, Blandford, Dorsetshire; Colonel Mansel, Smolmire House, Corle Castle, Dorsetshire; the Rev. Dr. Heidenheim, British Chaplain, Zurich.

LEAMINGTON COLLEGE BOARDING HOUSE.—The NEXT TERM commences on September 22. Inclusive Terms from 20 to 30 Guineas. For Sons of Professional Men 10 Guineas less. There is a special Tutor and separate Dormitory, &c., for small Boys. For particulars apply to the Rev. J. Wood, Head-Master, or to the Rev. J. S. RUDDARD, Chaplain and House-Master.**TRUST for carrying on the NORTH LONDON COLLEGIATE and CAMDEN SCHOOLS for GIRLS.—The CAMDEN SCHOOL for GIRLS RE-OPENED on Thursday, September 10, 1874. The NORTH LONDON COLLEGIATE SCHOOL for GIRLS will RE-OPEN on Thursday, September 17, 1874.****THE COLLEGE of STE. BARBE, Paris, Place du Pantheon, will RE-OPEN on October 5. This College is one of the oldest in France, and offers special advantages to Young Foreigners, as, besides providing a Classical Education, it has Special Classes preparatory for Commercial and Industrial Purposes of Science, Modern Languages, Mathematics, Book-keeping, &c. It has, further, a Branch Establishment for Children in the Country. Reference is permitted to Mr. Antonin Roche, Director of the Educational Institute, Sloane Street, London, S.W. Terms from 110 to 250 per annum, according to the age of the Pupil.****FULLANDS, TAUNTON.—OXFORD MATRICULATION and RESPONSIONS, and CAMBRIDGE PREVIOUS EXAMINATIONS.—PRIVATE TUITION, by Graduates of Oxford and Cambridge, for the Universities, the Indian Civil Service, Woolwich, and other Examinations generally. The next Term will begin on September 21.—For Prospectuses apply to the Rev. the SECRETARY.****FULLANDS SCHOOL, TAUNTON.—The aim of Fullands School is to provide for the SONS of GENTLEMEN a thoroughly good Education, similar to that given at the Public Schools, but at a moderate cost.**

Principal.

Mr. REED, Fellow of the College of Preceptors, London.

Vice-Principal.

HEAD MATHEMATICAL MASTER.—Rev. WILLIAM REED, M.A., St. John's College, Cambridge; 16th Senior Optime, Tripos, 1869.

HEAD CLASSICAL MASTER.—FRANCIS REED, Esq., B.A., Exeter College, Oxford.

There are Three School Terms in the year, of an average duration of Thirteen weeks each. The Michaelmas Term begins on September 21, 1874.

Prospectuses may be obtained on application.

ABINGDON SCHOOL (Six miles from Oxford).—NEXT TERM begins on September 19. Another Dormitory is now ready for occupation. A Public School Training. Moderate and inclusive charges. University and Entrance Scholarships.—Address, Rev. E. SUMMERS, Head-Master.**THE MILITARY COLLEGE, Spring Grove, Isleworth, W.—Capt. CH. D'ARBOIN, R.F.E., receives and prepares a limited number of PUPILS for Woolwich and First Appointments to the Army, Cooper's Hill College, the Forests and Telegraph in India, and the Civil Service.**

Special Training for Militia Officers, including Drill and Army Regulations.

For particulars, terms, and references, apply to Capt. D'Arboin as above.

AN OXFORD GRADUATE, in Honours, an old Marlborough, and late Scholar of his College, now Rector of a Suffolk Parish, receives PUPILS.—Address, Rev. W. LEMBA, Great Blakenham, Ipswich.**PRIVATE TUITION for ARMY, COOPER'S HILL, CIVIL SERVICE, WOOLWICH, and UNIVERSITIES.—Rev. Dr. HUGHES (Wyang, Cam.) has passed over 300, and occasionally has VACANCIES. Also quite distinct young Boys.—Ealing, W.****EDUCATION for BOYS, free alike from Clerical and Dissenting Influences, in the Family of a Layman, a CAMBRIDGE M.A. of much Experience.**

Age, Ten to Fourteen. Terms high.—Address, TAZEBARNES, Messrs. KORTY & EDEAU, Publishers and Booksellers, 190 Oxford Street, W.

ARMY, WOOLWICH, and COOPER'S HILL.—Mr. J. ANSTON, M.A. (Gold Medal) London, and Fifth Wrangler, Camb., prepares CANDIDATES for the above. During the present year he has passed seven for Cooper's Hill, Two for Woolwich, and Six for the Army.—24 and 26 King Henry's Road, S. Hampstead.**BOARDING SCHOOL for YOUNG GENTLEMEN, MONTREUX, Switzerland.—Herr and Madame RENKEWITZ beg to announce the removal of their Establishment into a spacious and comfortable House, beautifully situated on an extensive, with extensive grounds. They receive a limited number of YOUNG GENTLEMEN especially for the study of the French and German Languages, together with a sound English Education. Terms moderate. Masters resident in the Establishment. References on application to the PRINCIPAL.****LAW.—A GENTLEMAN (passed, but not admitted) seeks a CONVEYANCING or CHANCERY CLERKSHIP. He was a Carthusian, and understands French, having lived in France previous to being Articled. Good references.—Address, VERITAS, 15 Charing Cross, S.W.****SANATORIUM.—SUIDBROOK PARK, Richmond Hill. Physician.—Dr. EDWARD LANE, M.A., M.D., Edin.**

For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Papehaude. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

ROBERT PARK, Manager.

PUBLICATION of EDUCATIONAL WORKS.—All AUTHORS desirous of bringing their WORKS under the direct notice of the Scholastic Profession are informed that RELIEF BROTHERS have unusual opportunities of assisting them in the respect, as their Travellers, who visit the greater part of England twice a year, call on all the principal Educational Establishments in the Kingdom, and by this means introduce, in the most efficient way, all Books committed to their care.—3 Chatterhouse Buildings, Aldersgate, E.C.**E. DENT & CO., 61 Strand, and 34 Royal Exchange, Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL and FURRER CLOCKS, to Her Majesty, H.R.H. the Prince of Wales, and H.M. the Emperor of Russia. Makers of the Great Clock of the House of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.—E. DENT & CO., 61 Strand, 34 Royal Exchange (adjoining Lloyd's), and Factory, Savoy Street, London.****MAPPIN & WEBB'S A 1 SPOONS and FORKS.****GUARANTEED to LAST****TWENTY YEARS. GERMANY AND DENMARK.

THE visit of the Emperor WILLIAM to Holstein has naturally directed attention to the relations between Germany and Denmark. It is at the same time alleged that the Danish Minister at Berlin has been instructed to remonstrate against the expulsion from Schleswig of certain residents who had given offence to the German authorities. It was unnecessary to add that the Minister was directed to make his representations in the courteous language which is especially appropriate when diplomacy has no force at its back. A rumour has also been spread that Prince BISMARCK had made overtures for the annexation of the whole kingdom of Denmark to the German Empire. On this condition, it was said, not only the districts which were to be ceded under the Treaty of Prague, but the whole province of Schleswig, would be restored to Denmark, while Germany would receive an ample equivalent in the acquisition of the Danish fleet. As modern geologists hold that the changes which have formerly affected the surface of the earth are still continuing an uninterrupted progress, curious students of mythology may observe in its inception the contemporary formation of historical legends. Theoretical projects are embodied in some definite scheme which is then attributed to any heroic figure which for the time occupies popular imagination. There is no doubt that, with the addition of the entire Cimbric peninsula and the adjacent islands, Germany would look on the map more complete, and would be strengthened by the addition of a hardy maritime population. In the fabric of a dream it is not necessary to consider practical inconvenience. The experience of many States, including both Denmark and Prussia, shows the disadvantage of annexing alien territories inhabited by a disaffected population. The Danes are not without reason hostile to the German Empire, and their national sympathies would follow their ethnological affinity with the other Scandinavian countries. The other part of the scheme, consisting in the restoration of Schleswig to Denmark, is still more preposterous. The German inhabitants of the southern part of the province had long borne their Danish connexion with impatience; and, in default of the local independence which they would perhaps have preferred, they are proud of their position as subjects both of the Prussian monarchy and of the German Empire. A transaction by which their allegiance would be bartered for an external advantage would be repugnant to public opinion both in the province itself and in the whole of Germany.

The agitation which ended in the separation of Schleswig and Holstein from the Danish monarchy was founded both on legal and on political grounds. All Germans were with good reason convinced that Holstein shared the rights of a confederate State, and they had convinced themselves by plausible arguments that Schleswig was inseparably united with the more thoroughly German Duchy. The obstinacy of the Danes, too often encouraged by ill-informed foreign advisers, alone prevented an equitable settlement of the dispute; but Germany would never have assented to any compromise which would not have included the undisputed possession of Kiel. The port itself was within the indisputably German territory of Holstein, but it was used for the naval purposes of the sovereign who was also King of Denmark. A part of the bay was included in the province of Schleswig, which was claimed as an indefeasible possession of the Danish Crown. The Northern coast of Germany is but ill supplied with naval stations; and it seemed intolerable to

patriotic jurists that a German harbour should be occupied by a foreign Power. In an earlier generation it had been thought perfectly natural that an independent King should also be a prince of the Roman Empire, or, at a later period, a member of the German Confederation. The statesmen who framed the Treaty of Vienna failed to understand the change which had passed over national feeling during the long wars which followed the French Revolution. It was commonly supposed, except by scholar-like German politicians, that the objects of the Confederation then substituted for the obsolete Empire would be exclusively defensive. Both the King of DENMARK and the King of the NETHERLANDS were included in the Confederation in respect of the duchies of Holstein and Luxemburg, while they were supposed to direct the policy of the rest of their dominions without any reference to German interests. Thirty years elapsed after the peace before it was understood that Holstein and Kiel could not belong at the same time to Germany and to Denmark.

The EMPEROR'S visit to Kiel has produced more than ordinary enthusiasm, because it was, amongst other reasons, intended to celebrate the completion of a new ship of the line as a step in the expected advance of Germany to maritime supremacy. In his speech the EMPEROR stated that the name of the *Frederick the Great* was peculiarly appropriate to the first German ironclad ship which had been constructed at Kiel. It is true that the chief founder of Prussian greatness can scarcely have foreseen either the Imperial pre-eminence of his family or even the possession by Prussia of the Duchy of Holstein. In his time Prussia scarcely aspired to the rank of a naval Power, although he was at all times jealous of the maritime pretensions of England. Nevertheless his successor is fully justified in assuming that FREDERICK THE GREAT would have approved of every form of aggrandizement of his country and his dynasty, and of every attainable acquisition by land or sea. The Germans of the present day are unanimously desirous of increasing the national strength where it has hitherto been relatively deficient. In 1864 the Prussians were unable to encounter Denmark at sea, and in 1870 Germany was confessedly inferior to France. The recent expansion of commercial activity has tended to increase the mercantile marine; and there is no reason why the German Empire should not at a corresponding expense become the equal of Italy, or perhaps of France, as a maritime Power. Some German journalists have lately, with a levity not belonging to the national character, expatiated on the achievements and capabilities of a couple of gunboats which are cruising on the northern coast of Spain. The description of the activity and courage of the seamen, and of the jealous admiration of the natives, was not more dignified than the similar enthusiasm excited in the minds of English provincial reporters by a volunteer review; but it is intelligible that the nation which possesses an unequalled army should wish to have an efficient fleet, as the first of naval Powers sometimes endeavours to persuade itself that a few good regiments would be a match for a Continental army.

It would be interesting to learn whether any patriot in Holstein now remembers the hereditary claim of the Duke of AUGUSTENBERG to the ducal throne. Ten years ago it was deemed treasonable to question the hereditary right of the Prince who had been superseded by usurping European diplomatists in favour of the King of DENMARK. After the expulsion of the Danish forces, the rights of the lawful Pretender still commanded a certain show of respect; and the Prussian Government employed a Commission of lawyers

to examine the title which was afterwards summarily disregarded. On further consideration the Prussian Minister decided that Austria and Prussia had acquired both Holstein and Schleswig by right of conquest; and the cession of the Austrian claim after the war of 1866 completed the Prussian title. Although there was a certain cynicism in the mode of annexation, the inclusion of the provinces in the Prussian monarchy was the most desirable arrangement both for local and for national interests. Although the minor princes have submitted with commendable docility to the newly-created predominance of the Empire, it is possible that, when the pressure of BISMARCK'S strong hand is removed, the jealousies and ambitions by which the Confederacy was formerly distracted may revive. The chief security for the maintenance of national unity is the preponderating power of Prussia, which derives no inconsiderable increase of strength from the possession of the Duchies, including their naval stations. The people of Holstein, though they may have formerly cherished their provincial independence, feel a legitimate pride in belonging to a great State which is at the same time the principal member of the Empire. Holstein is fortunate in possessing a homogeneous population; but in Schleswig a dual Government would have probably been embarrassed by disputes with its Danish subjects. The complaints which are said to have been addressed in tones of studied moderation to the Government of Berlin would probably have been preferred in stronger language to a petty sovereign, who would at the same time have been a successful competitor. Except in the northern districts which Prussia retains in spite of justice and of the obligations of a treaty, no disaffection to the actual Government exists in either of the Duchies. It is incredible that a prudent statesman should wish to extend German sovereignty over the kingdom of Denmark.

SIR GEORGE BOWYER, "NEMO," AND THE
SATURDAY REVIEW.

SIR GEORGE BOWYER and a correspondent of the *Times* under the signature of "Nemo" have raised separate objections to the statements and arguments of a recent article in the *Saturday Review* on the conversion of Lord RIFON. Sir GEORGE BOWYER, on behalf of himself and Lord ROBERT MONTAGU, denies that they are willing in their zeal for Rome to sanction the dismemberment of the Empire. As he truly states, both the English advocates of Home Rule disclaimed, in common with Mr. BUTT and his Irish supporters, the policy which is attributed to them, not as a deliberate purpose, but as a natural consequence of the proposed measure. As a logician and a practised debater, Sir GEORGE BOWYER ought to be aware that in the conduct of a controversy some obvious steps in an argument are frequently necessarily omitted. The Paris Communists denied that they were murderers when they killed the Archbishop of PARIS, or promoters of rebellion and anarchy because they wrested the possession of Paris from the Government of France; yet Sir GEORGE BOWYER would probably think himself justified in discussing their conduct on his own principles, and not according to their own interpretation. When, with one or two exceptions, every English and Scotch member who is not a Roman Catholic opposes Home Rule as necessarily leading to the dismemberment of the Empire, it is a plausible conjecture that zealous Roman Catholics representing Irish constituencies are consciously or unconsciously influenced by an ecclesiastical bias in their eccentric political tenets. Neither Sir G. BOWYER nor Lord ROBERT MONTAGU would be Irish members if they were not Roman Catholic converts; and it is a singular coincidence that they should have persuaded themselves in all sincerity that a measure which would obviously facilitate the supremacy of their adopted Church is not incompatible with the national unity and greatness which are primary objects with their non-Catholic countrymen. Cardinal CLEMMY had probably sufficient reasons for opposing in one Irish county a Home Rule candidate. The Irish hierarchy and priesthood will scarcely disclaim the responsibility of having contributed at the last general election to the return of sixty supporters of Home Rule, including Sir G. BOWYER and Lord ROBERT MONTAGU. The Home Rule members who accept Mr. BUTT'S professions in earnest probably form a minority of the whole body, and they are certainly dupes. It may be readily admitted that those who identify Home Rule with separation beg the question

which they have on many previous occasions fully discussed. Sir G. BOWYER is a loyal English gentleman, but he is liable to misapprehend the relative force on his own mind of political and religious motives. A Mussulman enthusiast who was also an English patriot would have little difficulty in convincing himself that the duty of converting infidels by force had a tendency to secure the English tenure of the Indian Empire.

The zealous Roman Catholic who assumes the signature of "NEMO" misunderstands both the propositions which he assails and the doctrines which he imprudently undertakes to defend. The oath which he, rightly or wrongly, affirms to be a part of the puerile mysteries of Freemasonry may probably be subject to some trivial moral objection. It would be better not to swear to nonsense, though no reasonable man would hold that the misuse of a solemn form tended to impair the sanctity of a serious oath; but the comparison which is instituted by "NEMO" between Lord RIFON and HEROD ANTIPAS is at the same time bombastic and absurd. If "NEMO" were a professional casuist and not a mere amateur, he would understand that as a layman he is guilty of presumption in vindicating the ways of the POPE to man. Cardinal CLEMMY, who understands his own business, is always careful to explain that the mortal sin of Freemasons consists, not in the intrinsic wickedness of a secret oath, but in disobedience to the decrees of a paramount and infallible authority. When HEROD hastily swore to comply with any request which might be preferred by the agile daughter of HERODIAS, he implicitly undertook to murder a prophet who had given no just cause of offence. Lord RIFON, if he took an oath as Grand Master of the Freemasons, assuredly never undertook to put either the Archbishop of CANTERBURY or the POPE to death even at the unanimous request of the worshipful brethren. As a gentleman of unblemished honour, and, till lately, a Minister of the QUEEN, Lord RIFON was incapable of giving any pledge inconsistent with the strictest rules of morality. It was only when he acknowledged the authority of the POPE that his engagements as a Freemason can have disturbed his conscience. That which was, according to the old phrase, not *nudum in se*, became *malum prohibitum*. It was, on the other hand, intrinsically wrong to put JOHN THE BAPTIST'S head into a charger, but, as there was in those days no infallible POPE, HEROD was guiltless of the sin of disobedience which is imputed to Fenians and Freemasons. It is therefore a questionable, and on Roman Catholic principles an heretical, proposition that "HEROD was as inexcusable for the rashness of his fatal oath as if he had been an Ultramontane Catholic instead of a Hellenized Jew." HEROD only committed a murder with the brutal levity of an Oriental despot. In different circumstances he might have been guilty of mortal sin in disobeying the POPE.

Archbishop MANNING not unreasonably censures the Berlin Correspondent of the *Times* for quoting as authentic an absurd caricature of the Roman Catholic creed, attributed by a facetious Protestant to the converted Elector of SAXONY. By an odd coincidence it happens that one of the Archbishop's staff has since published an equally fabulous oath which he supposes to be taken by the Freemasons. The genuine form is probably rather frivolous than atrocious; but it is only known to the initiated. It seems that both CICERO and GROTIUS anticipated the Papal decree by disapproving of solemn oaths on trifling occasions. If nevertheless the Freemasons take an oath about matters which may be supposed to be trivial, it follows that the late Lord ZETLAND, the PRINCE OF WALES, and Lord RIFON differed from the Roman and Dutch moralists, perhaps because they had not sufficiently studied their writings. Both GROTIUS and CICERO would, if they had considered the question, probably have held that a fuss about nothing was almost as objectionable as an unseasonable oath. CICERO would not have attributed to JULIUS CÆSAR, whose title of *Pontifex Maximus* is inherited by Pius IX., the power of converting a harmless trifle into a mortal sin. GROTIUS knew more than CICERO about the Popes; and it is not understood that he was a zealous supporter of their extreme pretensions. The suggestion that the POPE claims absolute control over his spiritual subjects ought not to form a subject of controversy between Protestants and Catholics. The claim is asserted by Romanist divines, and rejected by their opponents, but that the pretension is maintained by the Church can scarcely be disputed. It seems unreasonable to deny that a convert who, at the command of the Church, renounces a course

of action which he had previously deemed to be innocent, submits to absolute dictation, and repudiates his own independence of moral judgment. It would perhaps be discourteous to hint that "NEMO," with the best and most orthodox intentions, is unconsciously heretical; but if he submits his letter to the *Times* to competent spiritual criticism, he will probably find that he has laid unhallowed hands on the wrong side of the Ark. He is on safer ground when he deals with secular topics, such as BISMARCK and his prototype NERO. The "Englishman before anything" view which excites the indignation of "NEMO" has never been propounded in the *Saturday Review*. There is no question of accepting the religious creed of NERO or BISMARCK, but of establishing a practical rule of political action. With rare exceptions, which it is unnecessary to define or to anticipate, an English politician ought primarily to regard the honour and interests of England. Those of the French clergy who would gladly involve their country in a ruinous war for the benefit, not of France, but of the POPE, incur moral guilt for which the only excuse is their ignorance and political incapacity. At present there may perhaps be no conflict between English and Papal interests, except that the Home Rule movement is favoured by a large section of the Roman Catholic clergy; but if the POPE were to issue an infallible decree that it was a mortal sin to send representatives from Ireland to an Imperial Parliament, it would be difficult to repose confidence in statesmen who had already acknowledged the POPE's power to define the limits of his own jurisdiction. No party in England claims for Parliament the right to assume the functions of the Inquisition by imposing or prohibiting religious opinions; but "NEMO" is, it may be feared, for a second time liable to the charge of heretical pravity in condemning a jurisdiction which was exercised for centuries by the Holy Office under the authority of the POPE. It is after all not worth while to inquire whether secular or ecclesiastical objects ought to engage the preference of statesmen. It is enough to know that those who are devoted to such mundane purposes as the promotion of the greatness and prosperity of England will, if they are well advised, employ agents whose attention is not diverted to different and perhaps antagonistic ends. To repeat a familiar illustration, a shareholder in the Midland Company who opposes the construction of a branch line because it may possibly injure the Great Northern Company, in which he has a larger stake, can scarcely expect to command the confidence of his Midland partners. The analogy of HEROD, BISMARCK, and NERO with the opponents of Papal pretensions is not equally obvious.

THE COALITION IN MAINE AND LOIRE.

THE Maine and Loire election has produced a singularly discreditable coalition between the supporters of the two candidates who stood lowest on the poll on Sunday week. It was natural enough that the Imperialist candidate should withdraw; indeed, with the Septennate playing the game of the Empire so thoroughly, it is almost strange that the Bonapartists should not have been content with M. BRUAS in the first instance. It was natural enough that the Septennatists should secretly hope to gain for their candidate a certain, perhaps a large, proportion of the votes originally given to M. BERGER. They are anxious of course that M. BRUAS should win on the second ballot, and in the excitement of an election the antecedents of your supporters must not be scrutinized too closely. The best testimony to a man's merits is the fact that he is going to vote on your side. But it is one thing to accept votes, or even to canvass for them privately, and quite another thing openly to solicit them on the plea of identity in political views. It is this latter step that has been taken by the Septennatists in the Maine and Loire election. M. BRUAS, in his second circular with the words, "M. BERGER has withdrawn; I am therefore the only Conservative candidate." He does not dispute the claim of the Bonapartists to be ranked among Conservatives, and by not disputing it he admits that the gulf which separates the Septennatists from the Empire is less impassable than that which separates them from the Republic. Nor does M. BRUAS stand alone in this respect. The principal Orleanist organ is equally eager to include the Bonapartists under the same general title. It admits that it thinks their particular theory of Conservatism mistaken, but it confesses that there is a common platform on which they may both work together. The

Bonapartists hate the Republic, and in every enemy of the Republic the *Journal de Paris* recognizes a friend whose alliance will be welcome even though he may have a few failings to be condoned.

This is to us a new discovery as regards the Orleanists. We had thought that, great as might be their detestation of the Republic, their detestation of the Empire was still greater. They seemed strangely blind to the progress which Imperialism is making in France, and strangely ignorant of the cause to which that progress is to be traced. But we thought that, if once they could be enlightened on these two points, their conversion would follow as a matter of course. The Orleanists are not unreasonably alarmed at the prospect of the furious political contests which would await them under a Republic. They would prefer, alike on theoretical and practical grounds, the mild constitutionalism of a limited Monarchy. No one can blame them for their taste, or for their determination to use such means as present themselves to create the Government which they desire. Nor does their refusal to see that the accomplishment of their wishes is impracticable imply anything more than an intellectual defect. To outsiders it seems sufficiently plain that there are only two possible Governments for France, and that whoever is not for the Republic must, whether he wills it or not, be for the Empire. But a party which is keenly interested in the realization of a third alternative may be excused for shutting its eyes to facts. The sin of the Orleanists consists in this—that they have opened their eyes to facts, and have not been shocked by the revolution. If it is clear that the Republic can only be defeated by a coalition with the Bonapartists, it is equally clear that whatever ground is gained by the coalition will be gained by the Bonapartist element in it. The Imperialists have a much larger following in the country than the Orleanists, and it is a following that increases every day. Supposing that the Orleanists succeed by their aid in getting rid of the Republic, they cannot expect the Bonapartists to join with them in proclaiming the Count of PARIS King. As between LOUIS PHILIPPE II. and NAPOLEON IV., which would be the most popular cry? On the side of the EMPEROR would be the army or a great part of it, the official hierarchy of almost all grades below the highest, the peasantry, and, at all events so long as the Count of CHAMBRORD lives, the Legitimists. On the side of the King would be the higher *bourgeoisie*, and so much of official society as has been leavened by the Orleanist sympathies of Marshal MACMAHON'S Government. It is impossible that any set of politicians, however shortsighted or however sanguine, can persuade themselves that there is any doubt which of these groups would be the stronger. It is impossible, therefore, that the Orleanists should be under any delusion as to the effect of a coalition with the Imperialists. They must know that it means one of two things—either the defeat of the Republic and a consequent Imperialist restoration, or the success of the Republic, unqualified by those Conservative influences which the Orleanists, if they would unite with the Left Centre, have it in their power to supply. As the latter is the result which they are especially set upon preventing, it follows that they must have made up their minds to acquiesce in the former. When we recollect the attitude of the Orleanists under the Empire, the dignified and consistent opposition which they offered to a system which then, as now, presented itself as the purest type of practical Conservatism, it is allowable to wonder at the change which must have come over them before they could regard M. BRUAS and M. BERGER as representing merely different aspects of a common faith.

It has still to be seen, however, whether the whole of the Orleanist party will follow the lead of the *Journal de Paris*, and whether Marshal MACMAHON will not himself be startled by this new development of Conservative policy. The Bonapartists never smarted more than under the sarcasms of the Duke of AUDIFFRET-PASQUIER when reporting on the military contracts made under NAPOLEON III., and it is hard to believe that the President of the Right Centre would really rather see the Septennate followed by a third Empire than transformed into a permanent Republic. At all events it is something gained that the issue between the Republic and the Empire should be so clearly raised as it is now in Maine and Loire, and will probably be again in the elections which are shortly to follow. When Imperialism first raised its head after its tremendous fall there were symptoms of real alarm among the Orleanists. One section of the party has evidently succeeded in lulling

its terrors to rest, but it is possible that another section may be less accomplished in the art of self-deception. As regards Marshal MACMAHON, he will perhaps be guided by the result of the approaching contests. Between this and Christmas there will be more partial elections than have yet been crowded together within so short a period. If there should be any striking uniformity in the political complexion of the members returned, the PRESIDENT may find the lesson easier to read than he has found it when the repetitions of it have taken place at longer intervals. The victory of the Republican candidates or of the Imperialist candidates would each be significant, and the victory of a Septennatist candidate, if secured—as, supposing it to be secured at all, it will be—by the co-operation of the Bonapartists, would be no less significant than the direct return of an Imperialist. If the MARSHAL had no other motive for distrusting the coalition effected in Maine and Loire, he might find one in the improbability that practised politicians like the Bonapartists would be so ready to bolster up the Septennate unless they saw their way to profit by it. It seems impossible that Marshal MACMAHON should again meet the Assembly without some serious thought upon the position he is to take up with regard to the consolidation of his powers. He has found during his recent journeys a striking unanimity of desire to see France furnished with settled institutions of some kind. If he wishes to gratify that desire, he has but two alternatives open to him. He may throw the weight of his personal authority into the Republican scale, and by that means detach a sufficient number of votes from the Right Centre to obtain a majority for the Republic in the existing Assembly. Or he may throw the weight of his personal authority into the scale of a Dissolution, in the hope of finding a new Assembly ready to give France a permanent Government which shall be neither Republican nor Imperialist. The latter of these courses has not much promise of success. The country may prove to have recovered from its Republican fit, but, if so, it will be only because it has fallen into an Imperialist fit. It is possible, therefore, that Marshal MACMAHON may yet try the experiment of instructing his Ministers to adopt the project of M. CASIMIR-PÉRIER, and consolidate the Republic while they are consolidating the Septennate. It is an unlikely supposition, but at present speculations on the course of events in France resolve themselves into a choice between improbabilities.

THE RAILWAYS AND THE PUBLIC.

THE inquiries which take place from time to time in regard to the slaughter of passengers by Railway Companies, though practically useless as a means of discipline or punishment for the latter, are at least interesting in furnishing the public with a statement of what is known as the "railway point of view." We had the railway point of view in great force at Wigan, when the principle was laid down that a Railway Company is entitled to send as much traffic as it can get over its line, without reference to the amount of accommodation provided for it, and that, if people are killed in consequence, that is only one of the necessary risks which must be encountered. We meet the railway point of view again in an equally clear and decided form in connexion with the recent massacre at Thorpe. Mr. ROBERTSON, the Superintendent of the Great Eastern Railway, said that "he approved generally of the train 'staff' system, and had introduced it on twelve or thirteen 'of the Great Eastern Company's single lines.'" It may be presumed, therefore, that he thought it valuable as a security for the safety of passengers. He went on to say, however, that it was quite impossible that passengers on the single line between Norwich and Brandall could enjoy the protection which was deemed indispensable on other parts of the system, the reason being "the number 'of special fish trains which had to be run.'" The families of the twenty-three people who were killed at Thorpe, and all those who were more or less maimed and mangled, will therefore have the satisfaction of knowing that the reason why precautions which are admitted by the Company's own practice to be necessary in other cases were not taken in this instance was simply that the Company preferred the profits of a brisk trade in fish to the safety of their passengers. There are no doubt a great many odd points of view in the world, but it is seldom that such a point of view as that of the Railway Companies is put forth with such cynical and

shameless candour. It is quite possible to conceive a BURKE and HARE point of view the logic of which would be very much of the same character. The Railway Companies here claim, not only tacitly, but openly, the right to kill their passengers, or at least to place them in imminent danger of being killed, in order that they may make the largest possible amount of profit out of their lines. The first thing to be done is to get as much business as possible; and the public must be content with just as much, or as little, safety as is compatible with special fish trains, excursion trains, irregular goods trains, and any other means of filling the pockets of the Companies which may be devised without reference to actual accommodation or existing obligations. There were two things which the Great Eastern might have done. They might either have doubled the line from Brandall to Norwich, or worked it on the staff system; that is, they might either have extended the line to make room for more traffic, or kept down the traffic to suit a single line. But they did neither. It is admitted that the traffic between Norwich and Yarmouth has increased 33 per cent. during the last fifteen years. "Thousands of excursionists passed over the line between Norwich and Yarmouth every summer; the goods and 'fish traffic were also heavy.'" Yet, notwithstanding the growing revenue derived from this part of the line, the Company could not bring themselves till quite lately to spend anything on it, and even now they are going to double only a small part. On the other hand, they might have enforced the staff system, which would have made the line safe; but then that would have been "inconvenient," for they could not have carried so much fish. An account might be made out in two columns—so much fish against so much slaughter. The public is assumed not to be so stupidly selfish as to expect that a Railway Company should spend a little money or give up a little extra traffic merely in order to make passengers reasonably safe.

It is very important that the questions thus raised between the Railway Companies and the public should be distinctly stated. It is possible that one or other of the officials at Norwich may be punished by a brief imprisonment for the error which was committed, and the Great Eastern shareholders will have to smart in heavy damages. Except, however, in so far as they may apply this warning, the Great Eastern Company will be perfectly free to go on working the line on which the disaster happened just as before. Indeed, this is what they are now doing; and even when the double line is made there will still be a section of single line between East Norfolk Junction and Brandall. Mr. ROBERTSON, the General Superintendent, made a remark which is extremely significant. He "thought the introduction of the staff system between Norwich and Brandall 'would only increase irregularities, especially in the case 'of a break-down.'" Other evidence which was given would seem to show that chronic irregularity is the normal state of at least this part of the Great Eastern system. Mr. STEPHENSON, District Superintendent, said that the down express had lately been getting more and more irregular in reaching Norwich; and Mr. ROBERTSON remarked that "in 'the summer months the trains were heavier, and that 'caused delay.'" Yet no special precautions appear to have been taken to guard against the increasing delays, irregularity, and consequent danger. Just observe how the work was really done. There is an understanding on the Great Eastern that any message relating to traffic on a single line must be signed by the official sending it before it is transmitted. The Superintendent said he should treat the despatch of an unsigned message by a telegraph clerk as a serious offence, to be dealt with according to circumstances, the clerk's previous character, &c. The District Telegraph Superintendent was equally emphatic as to the gravity of this offence:—"It was the duty of a telegraph clerk to see 'that a single-line message was signed by the inspector 'before sending it. Witness had never seen an unsigned 'message forwarded. If he had detected such a thing 'he should have very severely reprimanded the clerk concerned." It seems to be thought rather an exculpation of the officials that Mr. RAVENHILL, Captain TYLER's assessor, who examined the Norwich single-line telegraph books for twelve months, found "only three 'cases in which unsigned messages had been forwarded 'during that period." It will perhaps be thought that "only" is hardly the right word to apply to three irregularities in the course of a year, when any one of these irregularities might have been, as in the present case, destructive of human life. But we must put the fact that

these three irregularities did occur along with the District Telegraph Superintendent's statement that this is an offence of the gravest kind for which an offender would be severely punished, and that he had never heard of even a single instance in which it had happened. It is quite clear, therefore, that no attempt was made by the superior officers to ascertain whether this regulation was adhered to or not, and that it might have been broken every night without their knowing or apparently caring.

Another important rule is that no train shall pass over a single line without written authority. Mr. ROBERTSON, the Superintendent, stated that this rule was imperative in all cases, and that "the written authority was to be handed to drivers by the station-masters concerned." It would seem, however, that Mr. STEPHENSON, District Superintendent at Norwich, was not aware of this rule, for he said that "No instructions were given to the engine-drivers except by word of mouth." There is also a rule that when on a single line the crossing-place of trains going in opposite directions is changed, a special starting-order is to be given to the guard, who is to hand a copy to the engine-driver, and then both guard and driver are to satisfy themselves that proper arrangements have been made for the train to proceed. It will be observed that this is a very pretty rule for production before a coroner's jury. Nothing can be more careful and considerate than the conduct of the Company in prescribing all these checks, precautions, and securities; and what more can a Company do? It would of course be too much to expect that any of the superior officers of the Company should take the trouble to see whether these fine paper regulations are really carried out. Indeed it seems to be perfectly understood that they are provided only for the look of the thing, and are not intended to be carried out at all. "In practice," Mr. STEPHENSON says, "it has been found most convenient" not to obey this rule; accordingly the order is given to the driver and the guard receives an oral communication. Mr. STEPHENSON, however, contradicts himself on this point, for he had previously stated that no instructions were given to drivers except by word of mouth.

In the case of a recent collision on the Glasgow and South-Western Railway we have another illustration of the manner in which what is called the train staff and ticket system is worked upon a single line. The minute precision of the regulations on the subject is an acknowledgment of the importance of the precautions which are required to be taken. No engine or train is to leave a station unless the staff for that part of the line is actually at the station. If no second engine or train is to follow, the staff is to be shown to the guard, and then given to the engine-driver. If anything else is to follow, the staff is to be shown both to the guard and to the driver; but, instead of the staff being given to the latter, he is to receive a ticket stating "Staff following," which is to be his authority for starting. Thus either the staff must be shown and a ticket given, or the staff itself must be handed to the driver before a train is permitted to pass the station. And when the staff is away, that part of the line is to be considered blocked until its return. Moreover, as an additional security, the train tickets are to be kept in a box fastened by an inside spring, and the key to open this box is the train staff, so that—in theory—a ticket cannot be obtained without the staff. All this is beautiful on paper, and it is obvious that if these various rules were adhered to a collision would be impossible. Nevertheless, a collision did actually occur, and the reason of this is simply that nobody on the line appears to have thought it necessary to pay the slightest attention to the rules. The station-master had despatched the staff with a ballast-train, and had then gone off without leaving any one specially in charge of the station, or mentioning that the staff was away. A goods clerk had, in his absence, taken the responsibility of giving a Caledonian goods train which came up a ticket to go on, without troubling himself as to where the staff was. In theory the box where the tickets were kept could not be opened without the staff, but the clerk found the tickets, not in the box, but on the station-master's desk; and it appears that it was a constant practice to open the ticket-box with a ruler or poker when the staff was away. The driver of the offending goods train stated that sometimes he saw the staff and that sometimes he did not, and that more often he did not, and that he did not consider it his duty to ask to see it if it was not shown to him. These and other disclosures would seem to show clearly enough that the Railway Companies are for the most part

content to lay down rules without making any serious attempt to see that they are enforced, and that, in order to save time, officials of all grades are encouraged to neglect necessary and reasonable precautions, and to work the traffic anyhow on their own responsibility.

SPAIN AND EUROPE.

IF it is true that MORTONES or LASERNA has introduced a convoy into Pampeluna, the Carlists can scarcely hope to obtain any decisive success in Navarre. It is remarkable that they have never, except by the aid of internal treachery, captured any considerable town or fortress. There is much probability in the rumour that the districts from which they derive their resources are becoming tired of the war; but for the present Don CARLOS has intimated no intention of abandoning his interminable enterprise. It is even asserted that several cadets of the Spanish family of BOURBON have decided at a formal meeting that Don CARLOS is not only legitimate King of Spain, but heir of the Count of CHAMBORD in France. It is undoubtedly true that the descendant of PHILIP V. and of LOUIS XIV. is nearer in blood to the House of France than the Princes of ORLEANS who descend from LOUIS XIII.; and it might be plausibly contended that the Treaty of Utrecht is inapplicable to the circumstances of modern Europe; yet it is scarcely credible that two or three dispossessed Italian princes should presume to dispose of the accession to the throne of France; nor is their opinion likely to influence any party in Spain. There is no common basis of controversy between Royalists and Republicans; and the title of the Prince of the ASTURIAS is not less tenable than the pretensions of Don CARLOS. The male heir claims under the French law of succession which was introduced into Spain by the BOURBONS, and FERDINAND VII., with the assent of the Cortes, professed to revive in favour of his daughter the more ancient Spanish rule of descent. It is strange that a dynastic dispute as little connected with national interests as the Wars of the Roses should be prosecuted by successive generations in modern Europe. Foreigners have not even yet succeeded in understanding either the strength or the weakness of the Carlist cause. It is evident that the volunteers who sustain the struggle must be in earnest; but it is doubtful whether they are actuated by an imaginative feeling of loyalty, or by attachment to their own provincial independence. The clergy have never adhered as a body to the Legitimist Pretender, nor has he been openly favoured by the Pope.

The encouragement which the Government of Madrid derived from the recognition accorded by the majority of European Powers has recently abated. The different Ambassadors and Ministers have been accredited, not to the Republic, but personally to the Chief of the Executive Power. The representatives of Germany and Austria, evidently acting under concerted instructions, addressed Marshal SERRANO when they were received in formal audience, not as President, but as Duke of LA TORRE; and consequently they might without inconsistency withdraw their recognition from any successor who might be chosen by the nation. It has not been stated whether England follows the lead of Germany in the form as well as in the time of recognition. If the Spaniards think fit to describe their State as a Republic, there is no reason why foreign Governments should question the propriety of the designation. According to the ordinary use of language, a Republic is the alternative of a Monarchy; so that a nation without a king, although it may be subject to a provisionally absolute Government, is properly described as a Republic. On the abdication of King AMADEO a Republic was proclaimed by the Cortes which purported to represent the country; and when PAVIA turned the Cortes out of doors, no nominal change was made in the form of government. It is as President of a Republic that Marshal SERRANO is, like his predecessors, recognized by the United States of America, and it might be supposed that the same institutions are maintained for purposes of intercourse with Europe. In accepting from Germany and other Powers an ambiguous title, SERRANO probably wishes to leave himself open to the adoption of any political system which he may consider expedient for himself or for the nation. It is not even known whether the omission of all reference to a Republic was suggested by the PRESIDENT himself. He may perhaps calculate that his tenure of power will be confirmed by a personal recog-

dition of his independent authority. The approval of Germany and of France will enable him for the present to dispense with the convocation of a Cortes and with any form of constitutional sanction.

The refusal of Russia to concur in the recognition of the Spanish Government appears to have been deliberate and probably final. The Emperor ALEXANDER seems to have recurred to the policy of his father, who affected to be the champion of legitimate monarchy in every part of Europe. It was only under the pressure of necessity that NICHOLAS recognized LOUIS PHILIPPE in France and ISABELLA II. in Spain. The Quadruple Alliance of England, France, Spain, and Portugal was avowedly intended to counteract the policy of the Northern Courts, and especially of Russia. It is conjectured, not without probability, that one of the objects of the Emperor ALEXANDER is to proclaim his independence by refusing in a matter of secondary importance to follow the lead of Germany. For this purpose it would have been sufficient to withhold recognition; but, if a hitherto uncontradicted statement may be trusted, the Emperor has voluntarily affixed a more general meaning to his policy by addressing a letter to Don CARLOS on the disadvantages of revolutionary change. It is perfectly true that strict adherence to the principle of hereditary succession constitutes the best security against disorder and civil war; but the lesson was scarcely needed by the Spanish Pretender; and it is too late for the nation to profit by the benevolent counsels of Russia. The Spanish rule of succession was altered nearly fifty years ago, and the dynasty which was consequently placed upon the throne is now in exile. The suggestion that the Emperor ALEXANDER is neutral between the rival Pretenders seems to be far-fetched. It is true that Queen ISABELLA or her son might sympathize with denunciations of revolutionary movements and of Republics; but in addressing a letter to Don CARLOS the Emperor of Russia will be generally supposed to have acknowledged the validity of his claims. If the Imperial throne of Russia were not beyond the range of revolutions, a formal censure which would apply to all recent European changes might have seemed injudicious. A dozen Italian and German princes have been relegated into private life since the commencement of the Spanish troubles; and Austria has been excluded from the German Confederation. Russia has acquiesced more or less cordially in the results which have been attained, and there is some inconsistency in questioning the principles on which alone accomplished facts can be justified.

The French Royalists and other opponents of Marshal MACMAHON's Government have found in the Emperor ALEXANDER's letter to Don CARLOS an additional reason for disapproving of the recognition of SERRANO. It is not surprising that any difference of policy between Germany and Russia should encourage the hopes of dissatisfied French politicians; but the importance both of the recognition and of the Russian protest may be easily exaggerated. One of the strangest of recent political rumours is the statement that the Grand Duke CONSTANTINE has been sent to France for the purpose of procuring the elevation of the Duke of AUMALE to the first place in the French Government. It is equally difficult to understand why Russia should concern herself with the interests of the ORLEANS Princes, and how the supposed scheme could be furthered by the officious interference of a member of the Imperial Family of Russia. It is absurd to suppose that the Emperor ALEXANDER is contriving an alliance with France and Spain against Germany, although ingenious speculators have devised a cause of quarrel in the supposed designs of Prince BISMARCK against the independence of Denmark. It may be taken for granted that the Emperor ALEXANDER has made the condition of Spain serve as a text for a political discourse simply because remoteness renders interference in Spanish quarrels obviously impracticable. The German Government resented by the recognition of SERRANO an outrage committed by the Carlists on a German officer; but the hopes and fears of intervention in the Spanish quarrel have already subsided. Russia will give no assistance to Don CARLOS, nor Germany to the Government of Madrid. It is only because military operations are sluggish and indecisive that politicians amuse themselves by speculations on the intentions of distant and indifferent potentates. If SERRANO, by himself or his lieutenants, at last succeeds in terminating the civil war, he may regard with perfect equanimity any friendly relations which may have been established between the Emperor ALEXANDER and Don CARLOS.

NEW ORLEANS.

THE causes and consequences of the late events in New Orleans are not yet fully understood. The short-lived revolution in the government of the State of Louisiana is inaccurately described as a riot; nor has it perhaps been altogether abortive, though KELLOGG and his accomplices are for the present restored to office. A forcible protest has been made against a prolonged abuse of power, and the irregularities which were necessarily committed have been condoned by the Federal Government. The promoters of the insurrection must have anticipated the action of the PRESIDENT, and the result shows that they had no intention of risking a collision with the regular army, however small might be the number of disposable troops. It has been rightly observed that New Orleans is untenable against a naval force. In the early part of the Civil War the city surrendered as soon as the Federal squadron had passed the obstacles at the mouth of the river. The respectable part of the population and their leaders probably intended only to exhibit their superiority in numbers and organization to the supporters of the State Government, and perhaps to convey a warning against future usurpation. On the other hand, it has been too hastily assumed that the amnesty granted by General EMORY was a proof of weakness on the part of the Government at Washington. General GRANT must be well aware that he is responsible for the violence and corruption of KELLOGG, and he may have desired to intimate that, while he could not allow his own authority to be defied, no moral blame attached to the authors of the movement which had been provoked by an attempt to falsify future elections. General GRANT is unfortunately implicated, through a near connexion who holds a Federal office at New Orleans, in the local misgovernment of the city and State; but it is doubtful whether, in the event of a second disputed election, he would decide the controversy in favour of the Black Republican candidate. If General GRANT has made up his mind to seek a second re-election, he will probably think it expedient to conciliate the white inhabitants of the South. The Republican Conventions have hitherto not countenanced the renewal of his candidature, and he probably entertains no prejudice against the party to which he formerly belonged. The merits of the local quarrel in Louisiana may probably have been indicated by the character and position of the insurgent leaders. The only claim of the KELLOGG faction to consideration is derived from the adoption of their cause by one of the acknowledged leaders of the Confederates. General LONGSTREET, whose patriotism and honour were never questioned during the Civil War, thought it his duty to accept the command of the Militia under the actual Government, and in that capacity he lately surrendered the arsenals of New Orleans to the insurgent citizens.

In former times it would have been thought strange that the exercise of the sovereignty of a State of the Union should depend on the discretion of the President. Although the facts are disputed, it seems probable that the election of KELLOGG was fraudulent; nor was it doubted that the Federal judge who affirmed the validity of the election acted either on party grounds or under direct instructions from Washington. It was perhaps unavoidable that the PRESIDENT should sustain the judgment of the Court; and when KELLOGG was once recognized the insurgents, though they might be virtually the representatives of law and order, were technically rebels. It is not for the interest of the United States that the violent remedies usual in South American Republics should be employed even in the case of the grossest abuses. If the better classes were allowed to supersede the authority of a nominee of the rabble, the example would probably be followed by any discontented faction which found itself for the moment superior in physical force. At the same time it must be remembered that the insurgents had submitted patiently to the GOVERNOR whom they had regarded as a usurper, until he took measures for disfranchising his adversaries at the next election. They appointed in his place the LIEUTENANT-GOVERNOR who, according to their contention, had been legally elected, and they filled all the State offices with the candidates who had been chosen by the genuine majority of the constituency. It is possible that KELLOGG may be frightened into moderation by the proof that he is opposed by the moral and physical force of the State, and by the possibility that before another election his patron at Washington may have

changed his policy, especially if his own candidature is rejected by the mass of the Republican party. The permanent suppression of the public opinion of the South is utterly inconsistent with American traditions. The more judicious Republican leaders cannot but feel that the support of such adventurers as KELLOGG involves their party in gratuitous discredit.

Although the opponents of the State Government of Louisiana appear to have had no connexion with outrages which may have been inflicted on the coloured population, there is no doubt that serious acts of violence have been perpetrated or threatened in various parts of the South. General GRANT's Circular to the military commanders of districts, which seems to have been issued before the temporary deposition of KELLOGG, conforms to the strictest rules of constitutional propriety. Commanding officers are directed to comply with the instructions which may from time to time be given by the Attorney-General, who will be responsible for the legal character of the measures which may be adopted. The military force at the disposal of the Federal Government is insignificant in numbers, but, as in New Orleans, its presence will probably be sufficient in every case to discountenance resistance. Disorderly bands will not fail to know that, if they were to defeat a handful of regular troops, the PRESIDENT's appeal would in a few days or weeks be answered by an irresistible force of armed volunteers and militia. It is not in this generation that the South, in spite of its just discontent, will venture to renew a disastrous war. Even if its inferiority in strength had not been conclusively demonstrated, all the circumstances have changed to its disadvantage. The slaves were, with few exceptions, loyal to their masters, or neutral; but the freedmen who have since enjoyed and misused political power would be formidable auxiliaries of the Northern armies. In many of the States the coloured militia are armed, and they have acquired the rudiments of discipline. The chief of the Federal Government is a successful soldier, and he would command the services of many able and experienced generals. It is through a rearrangement of parties, and not by a resort to force, that the Southern democrats may reasonably hope to recover political power.

The language used by Mr. JEFFERSON DAVIS and by other eminent Southern politicians furnishes sufficient evidence of the truth of the charges which are advanced against the disorderly part of the white population. Even if all considerations of humanity and good feeling were set aside, the commonest prudence would suggest the expediency of professing friendly intentions to the coloured inhabitants of the South. The victorious majority, after the close of the Civil War, rightly held that the liberated negroes were the clients of the nation. The unlucky boon of the suffrage was but an exaggerated acknowledgment of an undeniable duty. According to American notions, the obligation to protect the negroes was most effectually discharged by giving them a constitutional right to protect themselves. As might have been expected, they have shown themselves incapable of exercising political power, but they have in no degree forfeited their right to security of property and person. Their assailants, as Mr. JEFFERSON DAVIS perceives, wantonly deprive themselves of the benefit of the reaction which had been produced by experience of coloured misgovernment; and the necessity of maintaining friendly relations between the freedmen and their masters is social and economic as well as political. The prosperity of the Gulf States depends on the industry of the coloured population; and it is indispensable to substitute for compulsion sufficient inducements to labour. The former leaders of the Confederates may with perfect consistency repeat their former assertions that they were the best friends and the natural patrons of the inferior race. Mr. JEFFERSON DAVIS's sentimental reference to the bonds which unite the Southern citizen with the attendants and companions of his childhood is probably justified by the experience of the better portion of the upper classes. It is at least an indispensable condition of the tolerance and support of the Northern States that the negroes should be assured of protection against ill-treatment and oppression. Mr. JEFFERSON DAVIS would not have addressed a warning to his fellow-citizens if there had not been much foundation for the reports of Southern outrages.

IRISH JURIES.

A BLUE-BOOK has just been issued which illustrates in a very striking and painful manner one of the great difficulties of Irish administration. There are some things which a Government can do for a country, and there are other things which the people alone can do for themselves. In the latter category must be placed trial by jury. A Government can supply judges, but the working of the jury system demands the loyal and intelligent co-operation of the people. If that is wanting, the whole thing breaks down. It has been said that the object of the British Constitution is to bring twelve men into a box, and Ireland has enjoyed the application of this sacred principle. It is obvious, however, that the value of the system depends in a great degree on the conduct of the twelve men when they have thus been brought together. The theory of trial by jury assumes the competence and honesty of the persons who compose the jury; but even the most fanatical idolater of the institution would scarcely deny that the consequences are likely to be disastrous if the jurors fall below the requisite standard of character and intelligence. Hitherto, however, it has unfortunately been part of the conventional hypocrisy with regard to Irish affairs to ignore the inquiry whether the people of that country are really fit for the functions imposed upon them. The great body of the Irish people are ignorant, passionate, and prejudiced, keenly alive to social and sectarian differences, and by no means disposed to take a calm, judicial view of any question. It might have been supposed therefore that it would have been seen to be necessary to confine the exercise of such important and delicate duties as those which a jury has to discharge to the educated and more sober and rational part of the community. Mr. GLADSTONE, however, under the instigation of Lord O'HAGAN and Cardinal CULLEN, was led to think otherwise, and in 1871 the more cautious system which had previously prevailed was cast aside, and the jury-box was thrown open to "flesh and blood" without reference to education or capacity. This was done, it should be observed, not because there had been any failure of justice, but in deference to an abstract theory of equality. It was held that the lower classes in Ireland could not be required to have confidence in the administration of justice unless they administered it themselves. This experiment has now been in force for a year or two, with the most deplorable, though most natural, results; and anybody who wishes to understand the paralysis and perversion of justice which at present prevails in Ireland cannot do better than study the Report of the Committee of the House of Commons on the Irish Jury System which has just been published.

The first witness examined was Mr. HAMILTON, an Irish barrister who has had great experience on the subject. He told the Committee that there was really no such thing as trial by jury in Ireland, and that even the fiction of it would disappear under the slightest strain. The last two years, he said, had been quiet, but "in case of any agitation or disturbance you would have to suspend trial by jury altogether." The result of the present system had been to put "a mass of prejudice, ignorance, and disaffection on the panel." In ordinary cases the juries simply did what the judge directed; but in cases where there was any agrarian or other disturbing element there was usually no finding. The lower class of jurors were either terrified by the Ribbon-men or were friendly to them; and there was "to a considerable extent a sympathy with crime" on the part of juries. Mr. W. ORMSBY, Sub-sheriff of the county and city of Dublin, gave similar evidence. Juries were hopelessly ignorant, and it would be better to abolish them altogether than go on with the present system. Mr. WEST, Chairman of Wexford County, pointed out that the tendency of the existing system was to introduce class feeling into the jury-box. A gentleman in his county fired four pistol-shots at another, but the accused was represented as "a favourite of the people," and got off easily. His attorney said, "I put the frieze-coated gentlemen on the plaintiff, and made him consent to a plea of guilty for a common assault." In short, disagreements and acquittals in the teeth of evidence are of frequent occurrence. Mr. DE MOLEYNS, Chairman of the county of Kilkenny, thought there was a feeling among the lower sort of jurors that "they were one class" with the prisoners, and that they had strong sympathies with them. He added that

jurors were systematically canvassed by the friends of prisoners, and were "exposed to injuries in different ways" which we hardly appreciate." Mr. LEAHY, Chairman of the county of Limerick, stated that, with the new jurors, there was the greatest difficulty even in the clearest cases in getting a verdict at all. They made all sorts of excuses for disagreeing—that nobody actually saw the crime committed, that there was only one witness, and that was not enough, and so on. In one case a juror sent a doctor's certificate of his inability to attend, but he afterwards turned up because he had been canvassed by the friends of a prisoner to try to get him off. Mr. BOLTON, Crown Solicitor for Tipperary, mentioned a case in which one of the jurors was drunk, and another was found to have just come home from seven years' penal servitude for cattle-stealing. He also confirmed other witnesses as to the frequency of bad acquittals—"sixteen at Clonmel, and fourteen of them" as bad acquittals as could be pronounced. Cases of murderous violence were frequently reduced by juries to mere ordinary assaults. The common cry to jurors on going into the box was, "Go in and free the boys." The practice of canvassing jurors was "becoming quite alarming in Tipperary," and persons supposed to have influence were taken on curs round the country canvassing jurors. Mr. BORN, another Crown Solicitor in Tipperary, reported that canvassing was very largely practised there, and "very" "extraordinary" verdicts were often given. In Kildare a juror declared that he could not find a prisoner guilty under any circumstances, because "he might himself be guilty of 'the same to-morrow.'" In Ennis there was a case of shooting with intent to murder. The blunderbuss exploded and the assassin's hand was blown off and was produced in evidence. The man was acquitted by a jury, many of whom "had come twenty miles to try the boy," and who immediately adjourned with his friends to a public-house to celebrate the event. The prisoner himself is said to have asked for his hand back, and the judge remarked that he might as well have it.

Mr. MURPHY, Senior Crown Prosecutor, Dublin, stated that, as far as his experience went, in any case of agrarian outrage, faction fight, or serious assault between farmers or farmers' sons, and so on, there was very little use in prosecuting in a great part of the South of Ireland at the present time. At New Pallas, in the county of Limerick, for instance, the population is divided by an old feud about the age of a bull into what are called factions of "Three-year-olds" and "Four-year-olds"; and "terrible crimes, not merely savage assaults, but brutal murders, have occurred, and very recently." Yet there is a difficulty in repressing these outrages, because juries will not convict. Perhaps the strongest evidence as to the incapacity of Irish juries is that given by Baron DEASY. In Sligo, he said, there was a case of ejectment on notice to quit; the notice was the only point in the case, and was, in fact, admitted. But the counsel for the defendant got up and implored the jury to stand between an oppressive landlord and the widow and orphans; and the consequence was a verdict for the defendant, in opposition to the directions from the judge. The "poor widow" in this case was a lady of large fortune, with a town-house in Merriam Square and another house in the country, and the oppressive landlord was merely trying to get back his own property. In Galway the state of things is said to be truly deplorable. Out of a panel of 265 jurors, "not one" fifth were capable of trying any case whatever, civil or "criminal." In a case of sheep-stealing, the prisoner's counsel challenged every man who was decently dressed and seemed intelligent; the Crown objected to the ragamuffins; and "the result was that we went through the whole of the 265 names without being able to get a jury." Ultimately some "set-asides" were taken in, but a verdict could not be got after all. In an action for trespass, as to the facts of which there was no dispute, the jury would not agree to find any damages; "perhaps," says Baron DEASY, "because they thought that the plaintiff, 'being an hotel-keeper, had no right to have land at all.'" In another case a son had murdered his father and signed a confession, but his counsel argued that the confession was dictated by a sentiment which especially animates the Irish breast, a sense of filial affection, and that he had made it to screen his mother, an old woman aged eighty, who was too feeble to lift her hand. The prisoner was acquitted.

It is clear from this evidence that a very great mistake was committed in introducing a lower class of jurors into the box. It is not merely that many of these men are too

ignorant and stupid to understand the nature of the cases which they have to try, but that they act under the impression that they have been brought there to take care of themselves as a class, and to see that "poor men" come to no harm. Mr. Serjeant ARMISTEAD defended the change in the system on the ground that "he would do anything" to satisfy the men in the dock that they were to get a fair "trial"; and he drew a touching picture of a jury, "with" "not so much as a necktie, hardly a shirt" among them, trying a prisoner of the same rank but "dressed up a" "little for the occasion." He had observed, he said, the good moral effect of a verdict found by such men, who were really the peers of the prisoner. "A general sigh" goes through the gallery when they find that peasant "has convicted peasant." There is no doubt a certain amount of truth in this, and it is of the utmost importance that men of the lower classes should be convinced that they have the same chance of being fairly tried as other people. But it is rather a dangerous experiment to put into the hands of the lower classes, especially when they are so ignorant and prejudiced as those of Ireland, the power of thwarting the efforts of justice to reach criminals in their own rank of life; and it is evident that this is the use which a great many of the new jurors have made of their privilege. The question is, what is to be done when peasant will not convict peasant, or give a verdict against one in a civil suit when his antagonist belongs to a higher class? In addition to the case of the poor widow with a town and country house, Baron DEASY mentioned three similar cases which were called before him, but very soon after the jury was sworn the landlords compromised with their tenants rather than go on; and he added that he thought it not improbable that this was on account of the appearance of the jury. It is not surprising that, after hearing this testimony, the Select Committee should have arrived at the conclusion that the qualification of Irish jurors was too low, and that the system required amendment. It is possible that some of the alterations proposed may have a good effect; but in the meantime a vast amount of mischief has been done, and it is to be feared that any attempt thoroughly to reform the system will be keenly resisted.

THE NATIONAL SOCIETY AND THE EDUCATION ACT.

THE National Society has been associated from time to time with some exceedingly ill-judged attacks upon the Elementary Education Act, and for this reason it is satisfactory to find that the amendments suggested by the sub-Committee which has lately made its report are moderate in tone even where they are inadmissible in substance. Upon two points the sub-Committee recommend that the Act should, if possible, be brought back to the form in which it was originally drafted. The COWPER-TEMPLE Clause ought, they think, to be repealed, and School Boards should have the power of aiding Denominational schools existing in their districts as well as of maintaining schools of their own. As regards the first of these suggestions, it may at once be conceded that the COWPER-TEMPLE Clause is indefensible on the score either of logic or of common sense. A clause prohibiting Denominational teaching in School Board schools would have been at least intelligible; a clause which, without prohibiting Denominational teaching, proscribes the use of Denominational formularies, seems expressly designed to make Denominationalism more unrestrained. Under the 14th Section of the Act of 1870 no School Board can allow the Church Catechism to be used in their school. But supposing Mr. MACKONNIE or Mr. BENNETT to write a catechism of sacramental doctrine, a School Board is perfectly at liberty to adopt it if it be so minded. It is not a "religious catechism distinctive of any particular denomination;" it is only a religious catechism distinctive of a particular writer. Dissenters indeed are practically less protected under this section than they would be if Mr. COWPER-TEMPLE had never exercised his ingenuity to make legislation ridiculous. If a Dissenting parent knew that the Church Catechism was used in a School Board school he would be more likely to exercise his right of withdrawing his children from the religious lesson than he is now, when he may merely know that the catechism in use was written by a Mr. Somebody of whom he has never heard. Still, though the repeal of the COWPER-TEMPLE Clause would be a just and sensible reform, it is quite another question whether it is worth while

making any considerable effort to get it repealed, or whether it is to the interest of the Church of England that she should take the lead in an agitation for that purpose. Unless the victims of injudicious legislation are exceptionally weak, the reversal of it is best left to those on whom it inflicts injury. As we have seen, the only real sufferers in this case are the Dissenters, and they are not so powerless to help themselves that the National Society need take up their cause. As the Act stands, every single doctrine of the Church Catechism may be taught in School Board schools, but it must not be taught in the precise words of the Church Catechism. Considering that when these doctrines are so taught the first thing that the teacher has to do in order to make the lesson intelligible to children is to translate them into other words, this is not a very important restriction. If the sense of the Catechism may be taught on weekdays, no great harm can come of leaving the actual phrases to be taught on Sundays. It is probable that any attempt on the part of the Church to repeal the COWPER-TEMPLE Clause would be regarded as a retrograde movement in the direction of Denominationalism, and, as such, would be hotly opposed. Before exciting any feeling on the subject, the National Society had better assure themselves that the change is worth fighting for.

The suggestion that School Boards should have the power of aiding Denominational schools is open to a similar criticism. The National Society will have profited little by the agitation against the 25th Clause if it follows the lead of its sub-Committee upon this point. The operation of this obnoxious clause is exceedingly limited, the reasonableness of the concession which it makes to the feelings of parents might have been supposed to be obvious, and the saving to the ratepayers is very great. Yet, notwithstanding all these merits, the clause has been the object of fierce dislike, and has done more than anything else to reduce the Liberal party to its present low estate. What would be the result of a change in the Education Act which allowed School Boards to subsidize Denominational schools at their pleasure? The conflict which now arises whenever there are indigent children in the school district and violent Dissenters on the School Board would then be provoked whenever any section of a School Board thought that the money of their constituents could be better spent in setting up schools of their own than in aiding existing schools. In other words, the creation of a School Board would invariably be the signal for a theological squabble. The denunciations of "concurrent endowment," for which the payments of school fees under the 25th Clause have so unjustly been made the occasion, would be renewed with far more reason whenever a School Board exercised the power of making grants of public money to schools of all denominations. The mere fact that School Boards possessed such a power would impart theological bitterness to every educational election, since, even if there were no ground for supposing that the School Board had any intention of making such grants, the party opposed to them would be anxious to guard against their ever entertaining the idea, should it happen to be suggested to them. The National Society will do well to consider whether the Church of England is likely to gain by driving every School Board in the kingdom to take a side in such a controversy. They ought further to remember that in the original draft of the Education Act this power was vested in School Boards, and that it was in consideration of this provision being withdrawn that the scale of Parliamentary grants to voluntary schools was increased. If School Boards now received the power of aiding Denominational schools out of the rates, the Opposition would certainly demand that the grants from the Consolidated Fund should be reduced to their old level. If this were conceded, the benefit conferred on Denominational schools by the change would be more than neutralized; while, if it were refused, the Church would be accused of sharp practice in abiding by a compromise as long as it was profitable to her, and repudiating it as soon as repudiation promised to be advantageous. The National Society must have a belief alike ardent and ill-founded in the good disposition of School Boards if it is prepared to expose the Church to this discredit, in the hope that the loss in reputation will be outweighed by the gain in money.

As regards the section of the Act which regulates the transfer of existing schools to a School Board, the sub-Committee, while holding that greater security ought to be afforded to the original trusts of such schools, "observe" that the mischief may be considerably reduced if managers

"of schools will pay special attention to the powers at present conferred on them" of reserving the use of the schools at times when they are not required for the purposes of the School Board. If the view taken by Mr. DANIEL, the Judge of the Bradford County Court, in a case which came before him on Monday, should be sustained, it will be a question whether managers not exercising these powers may not be removed for breach of trust. But the fact that the sub-Committee sees cause to remonstrate with the managers of Church schools for want of care in transferring their schools to School Boards is one from which the National Society may learn much. In whatever spirit the Education Act is worked, the principle of supporting schools out of the rates is one which, once introduced, must inevitably be unfavourable to schools supported by voluntary contributions. The two ideas are antagonistic. So long as there was no means of providing elementary schools except by individual liberality, every one interested in the progress of education subscribed to some school as a matter of course. No such obligation now exists. If there are not subscriptions enough to keep the necessary schools going, they will be provided out of the rates. Consequently a large number of persons who have hitherto subscribed to Denominational schools, not so much because they were Denominational as because they were schools, may in future be expected to be content with paying their share of the Education Rate. In many cases school managers will themselves take this view, and even where they do not themselves do so, they are necessarily influenced by the fact of their subscribers taking it. It is idle to suppose that any change in the Act or any judicial interpretation of the Act will arrest a process which has its origin in a natural dislike to paying for a thing twice over. Of course where Denominational zeal is strong, subscriptions will still come in freely, because there the object which the contributors will have at heart will be not so much elementary instruction as the religious accompaniments with which in Denominational schools elementary instruction is surrounded. But in schools of this type there will be no need to remind the managers of their powers of reserving schools for religious purposes even when they are transferred to a School Board for secular purposes. The same inability to appreciate the real scope of the Education Act is observable in the recommendation with which the Report of the sub-Committee concludes. "Lastly," they say, "facilities should be given by which School Boards may cease to exist in any district in which they are found to be unnecessary." It may no doubt be desirable that what is unnecessary should cease to exist, but there is some danger that this suggestion may be supposed to mean that the Education Act should be converted into a temporary expedient for giving the denominations time to collect and organize their forces. So long as they are inert, or ill provided with funds, the ratepayers must make good their deficiencies; but the moment that they have built a school where a School Board school had previously existed the occupation of the ratepayers is gone, and the School Board has nothing to do but to make its bow and retire. If this is really the intention, the fact that it has been avowed may not be without its use in opening the eyes of the members of the National Society to the pitfalls which may be spread for them by injudicious, though well-intentioned, leaders.

CYNICISM PAST AND PRESENT.

THERE is a certain phase of the cynical character which may be regarded as of modern date. The peculiar type of sentimental cynicism which grows out of the wounds of a weak nature belongs by right to our own time, and its exponents are to be found in sufficient numbers both in literature and in real life. Since the beginning of the century this form of tearful protest against the roughness and unamiability of existence has been more or less in fashion, and its origin may perhaps be referred ultimately to the false philosophies which underlay the French Revolution as well as to the eagerness with which these philosophies were seized and coloured by the poets of the day. To conceive of a "state of nature" where the task of living should be a more gentle exercise than in this rough workaday world serves, as a matter of course, to arouse speedy discontent with the existing plan of the universe. The ideal vision calls into being delicate susceptibilities and tender affections which are apt to be bruised and blunted in our common social sphere; and hence, as a first stage in the growth of the cynical character, there comes a sense of bitter pain at the unfeeling conduct of humanity. This stage, however, is merely transitory. Delicate susceptibilities soon determine to steel themselves against the cruel coldness of their surroundings; a genteel despair takes the place of the former tearfulness. The youthful cynic makes up

his mind to punish society for its neglect, and inasmuch as certain foolish aspirations and childlike desires have not met with the right enthusiastic response, the possessor of ideal thoughts decides that henceforth he will not believe in the possibility of any genuine emotion. This is the characteristic feature of modern cynicism. It seldom penetrates very deeply, but it takes many forms and appears under many disguises. Real life, as might be expected, offers a less favourable field for its exercise than is afforded by the life of fiction. Among men and women of the actual world the phase seldom survives early youth, and even while it lasts is likely to be rather roughly dealt with. The young gentleman who believes that life is too bitter for endurance succeeds fairly well with the young lady who has just left school. She is duly alarmed at the condition into which his mind has fallen, and is properly anxious to remove his doubts in the sincerity of his fellow-creatures. But grown men and women are apt to regard the symptoms as being troublesome rather than dangerous, and are content to wait till the patient shall be more fit for human companionship. In fiction and the drama the cynic has a better career. The labours of lady novelists have done much to perpetuate the type, and the cynical temperament is also found of service in the creation of stage heroes. We frequently meet with specimens of this latter class verging towards absolute despair in their outlook over the universe. They generalize from the minutest particulars, assuming an attitude of utter scepticism if they happen to be disappointed in love. The whole of life is judged to be false because the young ladies of the day wear false hair, and the only possible escape from the deadening conventions of the actual world is generally thought to consist in an ill-assorted union with an actress or a barmaid. In feminine fiction the cynical hero is not so easily reconciled to existence. He is more wicked than the pit and gallery would allow a stage hero to be. His opinions become altogether shocking, and his irregular ways of life are sympathetically accepted by the authoress as the manifestations of a sceptical state of mind.

It is interesting to compare this modern cynicism—itself neither very profound nor very beautiful—with the forms given to the same quality at an earlier date. Shakespeare's plays are rich in varied expressions of the cynical character, but in none of them do we recognize anything at all resembling the cynic hero of modern drama and modern fiction. The sentiments of the time were both too sincere and too robust to admit of such a creation. Personal feelings and disappointments were not then allowed to react upon the philosophy of the world, and individual passion was either too serious or too trivial to serve as the starting point for foolish generalizations upon the social fabric. There was indeed no such halting-place between the love-sickness of Romeo and Mercutio's lightheartedness as the morbid youth of modern days has found out. The character which by a superficial resemblance most nearly approaches to the inventions of our dramatists and novelists of the present time is that of the melancholy Jacques. His cynicism has about it a distinct tinge of modern feeling. It is deliberate and aimless, begotten out of no wrong, but maintaining itself from a sort of morbid pleasure in the exercise. His invitation to Orlando to sit down and "rail against our mistress the world and all our misery" is certainly characteristic of the cynic of the present day, and it is not improbable that Shakespeare here intended to expose the habit of affected melancholy. But the distinctive element in Jacques's character which separates him altogether from his modern representative rests in the keen observation and delicate philosophy which serve as the basis of his cynicism. He says himself of his own melancholy that it is "compounded of many simples extracted from many objects, and indeed the sundry contemplation of my travels in which my often rumination wraps me in a most humorous sadness." There is no element of contemplation in modern cynicism, unless a morbid self-examination can be said to deserve the name. Jacques's melancholy has a more objective character. It is a delicate essence drawn from the things of his observation; a subtle reflection of the sadness of the external world. His philosophy is precisely of the right depth of sadness to suit the needs of comedy; any deeper mood would suggest problems too grave to be controlled or solved by a successful climax. But the temporary misfortunes of comedy need an exponent, and Jacques's humour is in sympathy with that of the banished Duke till the final happiness arrives. When the supreme moment of comedy approaches, Jacques looks out for new fields of melancholy. He cannot follow the recovered fortunes of the banished Duke, for his sadness and his cynicism would then fall out of tune. Thus we have a test of the sincerity of his cynical humour which very few of the heroes of modern novels would be able to stand. These gentlemen, though they are of a more violent despair in the early stages of their career, generally seize upon the first opportunity of casting off the mask, and proceed to make themselves comfortable with the things of this world. They have no such persistency in sadness as belonged to the melancholy philosopher in the Forest of Arden.

But the strength of Shakespeare's grasp of the cynical character, as compared with that of modern authors, may be best seen in the more serious plays. Edmund in *King Lear* is a creation without any parallel in later literature. It is strange that, although the subjects of free thought and unrestrained speculation stand now in greater prominence, no writer of fiction has embodied with any force the kind of audacious scepticism exemplified in Gloucester's natural son. Shakespeare was always fond, as in *Faulconbridge*, of showing the freer and more adventurous disposition granted to bastard children, but nowhere else has the notion received so grand

an expression. Edmund is the personification of cool, cynical logic. He has a reason for every act of villainy; every thought is strictly controlled by a precise and selfish philosophy. There is no passion in his criminal purpose, and no fear of retribution in carrying it into effect. He thus stands in the play in direct antithesis to its central figure; for, as Lear is governed by emotions divorced from sober reason, so in the case of Edmund all emotion is subdued to the entire control of a relentless logic of villainy. His cynicism is the most comprehensive that can be imagined: he consistently scoffs at gods and men, and acts in literal obedience to his own understanding of personal advantage. In this way he serves as an idol and as a model of conduct to Lear's ungrateful daughters. His bold cynical generalizations upon life serve to support and strengthen their narrower selfishness, and it is with definite artistic intention that Shakespeare has represented both Goneril and Regan as being passionately attracted to Edmund, who stands as the ideal of their own less splendid but equally heartless careers. Cynicism of this profound order which has its fruit in villainous action does not find its way into modern literature. It is partly excluded by the presence of a more amiable but less vigorous philosophy of human nature, which seeks to represent wickedness as being rather a thing of circumstance than of individual bent. Our authors nowadays endeavour to explain their villains in a way which is completely repugnant to the spirit of the Elizabethan drama. Evil is there recognized as a substantive force for which there was no need to find adequate motive. Herein, indeed, lies the peculiar influence of Iago's character. The motives suggested for his treachery serve merely to put into action a great motiveless force of evil which, attached to a single individual, stands as the supreme embodiment of human wickedness. Iago is the profoundest cynic we can conceive of. Edmund has a touch of repentance at the last, but Iago passes from the stage with sealed lips, still self-possessed, and with all the secrets of evil unrevealed. It is the most cynical portrait ever painted, more devilish than Mephistopheles because of its humanity, and not yielding even to him in the appetite for evil. There is something more than the individual genius of its creator which puts such a character out of the range of modern literature. Not only in degree, but in kind, it lies beyond the reach of any novelist or dramatist of the present day. The modern conception of evil takes the form either of coarse brutality or of petty meanness. Types of splendid wickedness, cool and cynical of purpose, have dropped out of literature. Shakespeare's great villains possess supreme intellectual gifts; they forecast their careers of evil, and exhibit even towards their victims a rare and impartial judgment. Both Edmund and Iago appreciate to the full the nobility of the men they are betraying. There is no suggestion of obscured or imperfect intelligence in their acts, no blind passion of crime to be repented of in a calmer moment. On the whole, it may be said that within the range of Shakespeare's drama there are no characters so consistently calm and self-possessed as these two profoundest cynics, Edmund and Iago. There is one noteworthy instance in which a modern author has attempted to carve out an image of equal terror and power. Shelley's portrait of Count Francesco Cenci is drawn after Elizabethan models, but it is drawn with an animus and with an intensity of disgust that render it grotesque. The Count's avowed delight in cruelty, his fierce and merely animal plans of evil, are depicted in a style such as does not even find a parallel in the terrible drama of Webster. Bosola in the *Duchess of Malfi* is familiar and human compared with this monster of Shelley's brain. His villainy is cool without intellectual refinement. It is a record of evil which the artist has not made humanly credible to us. And the reason of this failure on Shelley's part is probably to be found in the fact that his own nature gave him no help towards the understanding of so profound a type of cynical wickedness. He had no real conviction of its possibility, and the portrait is therefore rather a cold intellectual embodiment of certain evil qualities than a genuinely imaginative product stamped with dramatic probability. This inability to lay hold of great embodiments of evil is characteristic of the literature of the day. The villainies of modern fiction lack all grandeur of conception. They do not spring from a deep-rooted cynicism of character, such as forms the only discoverable motive of the great individual villains of an earlier stage of art.

THE TOURIST SELF-PAINTED.

MR. COOK is, we trust, reposing on the well-earned laurels of his Pontigny pilgrimage. We are not sure, however, whether laurels is quite the right word. Caius Cæsar—not the great Dictator, but the Emperor who got his nickname from his boots—devised a new kind of honour called an "exploratory crown," and surely Messrs. Cook and Son deserve exploratory crowns more than any other men living. But of what leaves or other materials the exploratory crown was made we do not at this moment remember, and we rather think that it is not recorded; so it may turn out that in speaking of the laurel we have lighted on a wrong metaphor. Anyhow, after guiding pilgrims to Pontigny and quasi-crusaders into the land of Moab, it must be rather humdrum work to come down to "personally conduct" parties of everyday mortals along "the regular Swiss round." The thing however has to be done, and we have just lighted on a little book which teaches us how Switzerland, or, in tourist language, "the land of Tell," is to be visited according to the principles of Mr. Cook, at

what points it is proper to get up raptures, and what are the proper raptures to be got up at each point. The remarkable thing is that we cannot exactly make out who our instructor is, whether it is Mr. Cook himself or somebody else. The book inside and outside, and on every page, calls itself "Cook's." Yet Mr. Cook is constantly referred to as if he were some one different from the author, and we sometimes come across long quotations from writings of Mr. Cook, introduced in a way in which people do not commonly refer to writings of their own. In the introduction the writer speaks in the singular number, as "I," and he lets us into some of his personal experiences in an enthusiastic style. We could almost envy Mr. Cook the privilege of possessing an admirer at once so devoted and so eloquent as is revealed in the following extract:—

Many years ago I found out the immense advantage of having a Cook's ticket with me, that should need only to be stamped at the booking-office on leaving London, and was then a talisman in my hands by which I could pass from country to country, by rail, by steamer, in the diligence, on the mule; yea, it ensured the services of a guide also, and wherever I went and wanted to go, it was as a magic thing that realized to me all my wishes. But when from the introduction we turn to the body of the book, the singular number is forsaken, and the change to the plural produces some very curious results. The scene is Rouen, and we are told that some "of the social habits prevalent there differ largely from those in England, and even from those of Paris." As a specimen of these singular social habits, the commentator goes on to tell us, "for instance, we enter a barber's shop for the purpose of being shaved." There are those who shave themselves; there are those who are never shaved at all; but it seems that "we," that is, one must fancy, Mr. Cook's tourists in a body, are in the habit of going to be shaved in a barber's shop. What follows again makes us think of Caius Cæsar. When the tourists, no doubt personally conducted, have made their way into the barber's shop, a scene follows which we should certainly think was different from the social habits of England, Paris, or anywhere else. A brisk little maiden tucks a napkin round "our neck." She does not lather "our chin," but she "rubs our chin briskly with hot water." Then she dances as if about to remove "our scalp." Then "our chin" is sponged and powdered, and then "we" determine never again to "trust our chin" to the tender mercies of a French barberess. Here the famous wish of Caius seems to be brought about in real life. He wished that the whole Roman people had but one neck; and it would seem that Mr. Cook's tourists not only have but one neck, but also only one scalp, and, more emphatically than all, only one chin. The question of a single eye to the whole company has presented itself to us. We think it was the Genai in the Greek mythology who had only one eye and one tooth between them, and passed them from one sister to the other as they were wanted. The archdeacon also is held in ecclesiastical law to be the bishop's eye, and every reader of Aristophanes knows that the Great King himself had an eye which—or who—was capable of being so easily detached from the royal person that it, or he, was sent as an ambassador to Athens. With these precedents before us, it might not be an ill guess that the tourists also have but one eye among them, and that, as Pseudartabas acted as the King's eye, Mr. Cook himself may act as the tourists' eye. But, leaving this more subtle and doubtful speculation about the eye, that the whole tourist community has but one neck, one scalp, and one chin is plain from the adventure in the barber's shop at Rouen. The mention of the scalp again suggests another parallel, if not from Rouen itself, at least from one of its suffragan sees. Bishop Serlo of Séz, when he had wrought up Henry the First and his court to a deep fit of penitence for the sin of wearing long hair, struck the iron while it was hot, and sheared his whole congregation before they left the church. Still we have always pictured him to ourselves performing on many heads separately. If the whole court, like Mr. Cook's tourists, had but one scalp among them, the labours of the zealous prelate must have been greatly lessened. This then is the beginning, and "this done," "*ceci fait*," or, as Mr. Reeve would say, "when these preliminaries are terminated," Mr. Cook's tourists go on with their well-shaven chin to wonder at and admire the various points between Rouen and the Alps. Whether the common chin was ever again shaven in the course of the journey the outsider is cruelly left to guess.

We need hardly say that the information as to dates, places, and events which Mr. Cook or his author supplies for his tourists is of the most meagre and inaccurate kind. That might be taken for granted; but it gives us some insight into a state of mind which is worth studying when we find, not mere ignorance, not mere blundering, but deliberate determination, expressed in so many words, to cleave to fictions which are known to be fictions. It was really hard that Mr. Cook's tourists were not invited in a body to the famous millenary banquet two years back. A company which has only neck, one scalp, and one chin, may be supposed to have also only one mouth, so that the addition of a party of personally conducted tourists to the feasters in the hall of University College need not have made any ruinous addition to the stock of overburned cakes. The frame of mind in which Mr. Cook's tourists approach the legend of Tell is very much the same as that in which eminent and convivial persons approach the legend of Alfred. It is not a case of mere ignorance, which, whether in the case of Alfred or Tell or anything else, need not be blameworthy; it is a deliberate cleaving to falsehood when truth is set before them. Mr. Cook, or whoever writes for him, knows perfectly well that there have been such things as "discussions" of the legend which prove to their satisfaction that Tell was a myth,

and the time-honoured associations of places connected with his name mere fables." "Fools can destroy what wise men build, and the great philosophers of the day are mighty in destroying, while they have not power to create stories as pure and beautiful as that of William Tell." Very likely not; for it is no part of the business of philosophers or of historians to "create stories," whether "pure and beautiful" or otherwise; that kind of creation they leave to tourists and millenarians. "But here," so goes on our guide, "on the threshold of the land of Tell, we throw off the trammels of thought which dissecting writers would throw around our minds, and are determined to accept the traditions concerning the Swiss hero." It is something to find that, though the company has but one chin, yet it has more than one mind, and that those minds have reached the stage at which they have "trammels of thought" to throw off. But the process of "determining to accept" exactly describes the state of mind of which we speak. It may do as a set formula to express it. It is the state of mind to which truth has become indifferent, which "determines to accept" this or that, not because it is true, but because it is pretty or edifying or anything else which has nothing to do with truth. Be the evidence what it may, the mind in this state "determines to accept" or to reject, not as an act of reason, but as an act of the will. Falsehood sometimes pays better than truth; it most likely does so with a party of personally conducted tourists; and it also most likely pays to insinuate, as our guide is not ashamed to do, that those who doubt the story of Tell when travelling in Switzerland will also doubt the Gospel narrative when travelling in Palestine. When any one shall bring forward four lives of William Tell, contemporary, or such as any human creature could ever have fancied to be contemporary, we will argue this question. Till then, as our guide takes to quoting Bible against us, we will quote Bible back again, and remind both tourists and millenarians that there is something said in the New Testament about "him that maketh a lie and loveth it."

Still, if people "determine to accept" a legend, they should at least accept it in the form in which it is handed down, and not in some form of their own making. In the older legend William Tell is the hero of Uri, or, to give him the widest range, of the Forest Cantons only. In Mr. Cook's legend he becomes the hero of a much wider part of the world. Somebody is made to address the citizens of Basel, of all places in the world, as "fellow-citizens and countrymen of the immortal Tell." This, to be sure, is not Mr. Cook's own, but is copied from "Robert Ferguson's *Swiss Men and Swiss Mountains*." Whatever Mr. Ferguson's notions of Swiss mountains may be, his notions of Swiss men, to judge from this specimen, are not a little odd. So again at Flüelen "we" exchange the steamboat for the diligence, and commence the journey towards St. Gothard. One might ask whether the diligence which was taking "us" must not have been beyond the usual size. But never mind, we talk about Tell and quote Mr. Hopworth Dixon till "we" get on the other side, and then "we" make the following profound remark:—

The canton of Tes-in, which reaches from the St. Gothard to the lake of Como, although forming part of Switzerland, is decidedly Italian in character, and it is difficult for the tourist to believe that he has not yet quitted the soil which produced a Tell.

To those who know how the Val Leventina became "part of Switzerland" in any sense, and the relations which existed within living memory between it and "the land which"—if any—"produced a Tell," the notion of being still within this last land when we have crossed the St. Gothard is charming indeed. Yet after all our guide may be right. Brasidas stirred up his army of enfranchised helots by an appeal to the glories of Sparta, and Walter of Espée stirred up his Englishmen by an appeal to the glories of Normandy; and in the same way the hero of Uri may by this time have become also a hero of Ticino. But, at the first blush, it sounds rather like speaking of Scotland as the land which produced Edward the First, or of Ireland as the land which produced Cromwell.

This is the sort of thing on which our tourists are to be fed. It is not very wonderful that those who are "determined to accept" the legend of Tell should accept, seemingly as a matter of course and without any process of determination, the legend of the Theban legion, which legion, it is something to hear, was "one of the most courageous in the world." Their wholesale martyrdom draws forth a noble burst:—

Was not this a mighty sacrifice, a magnificent example of Christian heroism? Yet we have no picture, no poem on the subject. Perhaps our singers felt the theme too great for their muse, even as our painters found the subject too grand for their pencils.

In this kind of thing we are thankful for the smallest mercies, so we put on record that in Mr. Cook's account of the Theban legion first of all "every tenth man was mercilessly slain," then again "their numbers were decimated," and so on. It is a real comfort in these times to find that Mr. Cook's tourists have the means of learning that the word "decimated" means that "every tenth man was mercilessly slain." We have no such satisfaction when we are led into "the glorious valley of the Rhine," and find it "profusely studded with the remains of castles and mansion-fortresses which once formed the impregnable homes of numerous bishops and nobles." The "numerous bishops" are certainly a difficulty, as we never heard of any bishops in those parts save him of Curia Ratorum; but perhaps this unrecorded abundance of bishops may go some way to account for the remarkable number of cathedrals which the tourists are taken to

on their journey. There is one at Luzern, another at Nenfshâtel, another at Zürich, another at Schaffhausen, and even one at little Zug, all of which sees are unknown to Spruner or Potthast. At Basel the tourists get into the cloisters and make the curious remark that they are "lonely and gloomy now, and so they must have been for the past five hundred years." What happened at Basel in 1374 to make the cloister specially "lonely and gloomy" is not to be found in the eight volumes of the local historian Ochs. But the loneliness of the cloister has so impressed the mind of the guide that he stands forth in his own single person, and it is no longer "we," but "I," from whom the recommendation to go and look at it is put forth to "all who visit Basel and have nothing else to do about the hour of sunset." Presently they get to Sursee, and, finding a double-headed eagle over the gate, they set it down as "the double eagle of the house of Hapsburg." In the very same page they get to Sempach, where, if they had looked at the very walls of the *Schlachtkapelle*, they might have seen the lion of Austria made captive by the bull of Uri without a single feather of the bird of Caesar being ruffled by the exploit.

We will end with one more extract on a subject on which at all events Mr. Cook ought to be well informed:—

The Federal Post Diligences are under the management of the Confederated States, or Cantons, and the Electric Telegraph is controlled by the same authority; hence the great privilege of being able to send a short message to any part of Switzerland to which telegraph wires extend, for half a franc. The telegraph is established over most of the tourist lines of travel. A wire, like that which connects Balmoral with London, for the special interest and advantage of Royalty and the Government, runs alongside of the road from Geneva to Chamouny, and from Lucerne to the summit of the Rigi; thus, for a trifling sum, enabling tourists to bespeak rooms in advance, or to ascertain if accommodation can be had.

We here get a little confused between the Confederated States or Cantons and the special interest and advantage of Royalty and the Government. Perhaps it was needful to explain that a telegraph is no less possible in a monarchy than in a Federal Commonwealth. But at any rate we do not know of any place between Balmoral and London where we have the great privilege of sending the shortest message for so trifling a sum as half a franc.

THE REUNION CONFERENCE OF BONN.

THE English newspapers, only too thankful just now for any sensational novelty which their Correspondents may be able to supply, have been full of reports—for the most part sufficiently inaccurate—of the Theological Conference on the Reunion of the Churches held last week at Bonn. We referred some weeks ago (*Saturday Review*, August 8) to the Circular of invitation issued by Dr. Dollinger, and we pointed out that the proposed Conference was quite distinct from the fourth Old Catholic Congress to be held during the previous week at Freiburg-im-Breisgau. It was in fact a personal scheme of Dr. Dollinger's, who alone issued the invitations and drew up the articles to be submitted to the assembly; nor does any one, whether among the Old Catholics themselves or the foreigners invited to meet them, appear to have received any information, before the actual opening of the Conference, on Monday morning, September 14, as to the order of proceedings or the subjects intended to be discussed. Even then no printed or written copies were distributed of the Resolutions, which were successively read out, first in English, then in German; and both Anglicans and Orientals complained a good deal of being called upon at a moment's notice to vote on grave theological questions which they had had no opportunity of considering beforehand. It is only fair to say that Dr. Dollinger—who displayed throughout a readiness, tact, and energy truly marvellous at his advanced age—did his best in his conduct of the meetings to obviate the serious inconvenience arising from this want of organization and method. He was throughout the life and soul of the Conference, reading out and explaining all the Resolutions himself, both in English and German—the Orientals, with one exception, speaking and understanding the latter language only—listening with exemplary patience and courtesy to the comments, sometimes equally tedious and irrelevant, of the various speakers, and translating the substance of the more important speeches into German or English, as the case might be, for the benefit of those who could not understand the original. In all these respects, a more skilful and efficient president of a mixed assembly representing several very diverse nationalities, Churches, and habits of thought, could not have been desired. He was supported by Bishop Reinkens, who spoke occasionally and always much to the point, Dr. Rousch, Professor Knoodt, and other influential members of the Old Catholic party, who however took very little part in the discussions. There were some half-dozen members of the Eastern Churches, among whom M. Janysehew, Rector of a Theological Academy at St. Petersburg, and a Professor from Athens—the former especially—were the chief speakers; an aide-de-camp of the Grand Duke Constantine, M. Kiriejew, also took some part in the debates. We may observe in passing that neither among Orientals nor Old Catholics was there any distinction of dress observable between priests and laymen. Among Anglican divines the most conspicuous figures were the Bishop of Winchester, Dr. Liddon, the Warden of Keble, and Dean Howson; while the American Episcopal Church was represented by the Bishop of Pittsburg and Mr. Nevu, in whose

hands, it may be observed, the claims of their own communion never suffered. The Abbé Michaud was present from France, but only as a listener; and the German Lutheran ministers, several of whom attended the meetings, preferred also to play the same part. But a Danish Lutheran, Schöler by name, who seemed to be overflowing with a general amiability, was constantly on his legs, though the drift of his remarks was usually the reverse of perspicuous. None of the meetings were "held with closed doors," as was erroneously stated in the *Times*, nor were any of them "opened with prayer," but at the close of the last sitting the whole assembly, led by Bishop Reinkens, joined in reciting the *Te Deum* and *Pater Noster* in Latin.

We cannot of course undertake here to give a detailed account of proceedings which extended over three entire days, and must content ourselves with noting the more salient points. It was unfortunate that the Bishop of Winchester, whose theological learning, as well as his courteous and conciliatory bearing, admirably qualified him to take a prominent part in such deliberations, was called away by domestic engagements on the Monday evening, when the lead of the English-speaking contingent fell into very different hands. Bishop Kerfoot, of Pittsburg, may, for aught we know, be a consummate theologian; but it was difficult to find a proof of such attainments in what he said, while his tone contrasted strikingly with that of his brother prelate and of the leading English divines. The Orientals observed that "he marshalled his party like a commander at the head of a regiment." On the other hand, the Easterns, though far less denunciatory than the Bishop, were as stiff and impracticable as possible on every point where the peculiar doctrines of their Church were concerned. With such heterogeneous elements at work, it is hardly wonderful that no direct results very satisfactory to aspirants after ecclesiastical unity should have been attained. Real differences, where they existed, were solved over rather than settled—though it is certainly something that members of communions long so hostile could be brought even to think of settling them. Some propositions, which the Easterns could not be induced to accept on any terms, were withdrawn; some, about which they or the Anglicans had views of their own, were ultimately resolved into such general shapes as to be capable of subscription in different if not opposite senses. In one instance, to be mentioned presently, the majority of the Conference—under the dictation of Bishop Kerfoot, and with the full assent of the Easterns—adopted a resolution which appeared to the minority to go far towards creating a new article of faith for the purpose of putting the whole Roman Catholic Church under anathema. The profound divergence of view between Eastern and Western members of the Conference was brought to the surface in the very first point submitted to them—the too famous controversy about the *Filioque*. On this question the Old Catholics seemed disposed to side absolutely with the Easterns; for the proposition first submitted to the meeting by Dr. Dollinger was that "the way in which the word *Filioque* was inserted in the Nicene Creed was illegal, and that with a view to future peace and unity the original form of the Creed, as put forth by the General Councils of the undivided Church, ought to be restored." To this latter clause the Anglicans of course refused to assent, and a special evening meeting was held on Monday to see whether the Greeks could be brought to accept any compromise. But three hours' debate, chiefly carried on between Dr. Dollinger and M. Janysehew, left matters just where they were, and the subject had to be taken up afresh the next morning. The English divines had offered to substitute for the last clause, which they could not accept, "It is much to be desired that the whole Church should seriously set itself to consider whether the Creed could possibly be restored to its primitive form, without sacrificing any doctrine which is expressed in the Western form." The Greeks first proposed to substitute "may be" for "is," and then "contained" for "expressed"—both of which suggestions were declined—and finally succeeded at the last moment in getting "any doctrine" changed into "any true doctrine," for the obvious purpose of implying that the Western doctrine might be—as they had over and over again asserted that it was—not true, but false. The Anglicans, however, who were thoroughly wearied out with the persistent doubling, so to say, of their astute rivals, suffered themselves to be outwitted at last, and the assembly acquiesced after a day and a half in this unmeaning formula.

Soon after this difficulty had been settled, or rather shelved, a fresh bone of contention was thrown into the deliberations by the introduction of the following article:—"We reject the new Roman doctrine of the Immaculate Conception of the Blessed Virgin Mary as being contrary to the tradition of the first thirteen centuries, according to which Christ alone was born without sin." Dr. Liddon, who was energetically supported by several of his compatriots, both clerical and lay, while himself rejecting the Immaculate Conception both as a dogma and as an opinion, strongly opposed the Resolution. He and those who agreed with him argued that, if the object was to repudiate the Pope's right to impose new articles of faith on the Church, it was better to say so plainly, and leave the doctrine itself, what it had always been before the year 1854, an open question in the Roman Church. There was, they said, a patent absurdity in a miscellaneous assembly of divines at Bonn assuming the very power to establish dogmas which they denied to the Pope; and to begin the work of reuniting Christendom by putting some two hundred millions of Christians under ban was rather like undertaking to enact *Hamlet* with the Prince of Denmark's part left out. The

more baseless the doctrine itself might be considered, the less reason was there to bring out a sledgehammer to crush it. This and a good deal more to the same effect was strenuously urged. But the Greeks stated briefly that their Church did not hold the doctrine, and therefore the more uncompromisingly it was condemned the better in their judgment; still they would not have insisted on the proposed formula, but the Bishop of Pittsburgh denounced all attempts at conciliation or compromise. The fact that the inculcated belief was held by the whole Roman Catholic Church was, he said, to his mind, a strong additional reason for condemning it in the most explicit terms. He was listened to with visible impatience by several of the English, and seven, more than a third of the whole number, voted against him. The Resolution was ultimately carried after a debate prolonged through two sittings. At the last moment Bishop Reinkens interposed to point out an extraordinary oversight in the wording of the Resolution, which condemned the Immaculate Conception because "Christ alone was born without sin," though it is notorious that all the great mediæval divines, such as Aquinas, St. Bonaventure, and St. Bernard, who opposed the former doctrine, asserted strenuously the immaculate nativity of the Virgin. "Born" was therefore hurriedly changed into "conceived," and so the motion passed.

These two points alone excited any prolonged discussion. Two Resolutions however had to be withdrawn because the Greeks declined to accept them. One of them asserted the validity of Anglican orders, which, as Dr. Dollinger pointed out, was "a purely historical question," and one on which the Old Catholics had fully satisfied themselves. The Russians, without asserting any contrary opinion, said that, as they had not had an opportunity of examining the question and their ecclesiastical authorities had not pronounced upon it, they were not prepared to commit themselves. This article was therefore not put to the vote, but the public testimony of the Old Catholic leaders to the fact of the English succession remains of course on record. Any active sympathy from English Churchmen with the Old Catholics must of course depend upon their feeling that their orders are recognized by the latter. We should have thought that the only intelligible objection to the other rejected article—an objection which might have been applied to others that were not rejected—was that, although true, it was no better than a truism. Roman Catholics and Protestants might agree that "the invocation of Saints is not commanded as a duty necessary for every Christian"; only the former would add that it is a salutary and pious practice, while the latter would mostly reject it as idle if not superstitious. The Orientals, for their part, on some ground connected with the Acts of the Seventh Œcumenical Council, refused absolutely to admit the proposition, which was accordingly withdrawn. Another point which seemed likely to create difficulty was got over by a sort of compromise. At a private meeting between Dr. Dollinger and the leading Anglicans a somewhat ambiguous formula on the Eucharistic Sacrifice and Presence was agreed upon, partly cast in the language of the Epistle to the Hebrews, which was afterwards submitted to the Conference. The Easterns looked askance at it, and took pains, one after another, to lay down the doctrine of their own Church on the subject in very unmistakable terms, borrowed, we presume, from the Orthodox Catechism, but closely coincident with the language of the Council of Trent, as to the identity of the Sacrifice offered on the Cross and in the Mass for the sins of the living and the dead. They said that, if that was the meaning of the article, they would accept it, but not also. Dr. Dollinger assured them that they were right; but he did not think it necessary to translate their remarks into English, and it may be questioned whether Dean Howson *e. g.*—who had previously declined to vote for an article asserting prayer for the dead—would have been equally ready to accept their interpretation of the formula. In this, as in other cases—notably in the very elastic article on the number of the Sacraments—we cannot help thinking that more success was achieved in hitting on a vaguely comprehensive form of words than in ascertaining or securing any real unity of belief. M. Schuler closed the debate on the Eucharistic article—speaking for once directly to the point—by an emphatic assurance that it was quite in harmony with the teaching of the Danish Church, which Dr. Dollinger said he considered an important fact.

We should be sorry to chill aspirations which, for various reasons, Scriptural, practical, social, and even political, must always possess a powerful, and we should hope an increasing, attraction for devout and earnest minds. Still less would we say anything in disparagement of the great leader of the Old Catholic movement, who has given abundant evidence during the last few years that for him no sacrifice is too costly which may be required for maintaining the full integrity of his convictions. But if the Reunion Conference is to meet again next year, as seems to be generally understood, it would certainly be well that the scope and aim of its deliberations should be somewhat more clearly defined. If the object really is, as the Circular issued this year appears to imply, to promote a general reconciliation of Christians, the Old Catholics should be especially cautious of building up fresh barriers by the premature introduction of needless innovations, even where a change may be thought in the abstract desirable. If, on the other hand, their main object is to come to an early understanding with the Russian Church—and there were not wanting signs of this, particularly in the final sitting, where sundry explanations and announcements were volunteered exclusively for the satisfaction of the Easterns—that is a matter chiefly interesting to themselves. According to

their own estimate, as given the other day at the Freiburg Congress, they do not number at present more than about one hundred thousand, and that is a very small fraction indeed of the great body to which they still profess to belong, and which, we presume, it is their aim gradually to interpenetrate and reform. They reasserted at Freiburg more loudly than ever the claim which they have constantly put forward during the last four years, to represent "the Church as it was before the Vatican Council." The difficulty of substantiating that claim would be indefinitely increased by any step involving a violent breach with their ecclesiastical antecedents, which would in fact be to assume the position of a new sect, in place of the nobler though more arduous office of a purifying and reforming power within the bosom of the Church.

YACHTING.

THE arrival of the equinox has caused a large number of the graceful yachts which have skimmed the Solent and the Channel during the last three months to fold their white wings and take up their winter quarters. A few of the larger craft and more adventurous owners are preparing for cruises more exciting than that from Cowes Castle to Torbay harbour; but the majority of English gentlemen are not disposed to risk the broken seas of the Bay in September, or the chance of a white squall, which may almost at any time lash up the blue waters of the Mediterranean into a very pretty imitation of a storm. The English now possess by far the largest fleet of private sailing-ships in the world, but the most persistent advocate of national progress would hardly instance this as a proof that the spirit which animated the sea captains of Elizabeth has been thrown into the shade by our modern courage and love of danger. The twin steamer of Captain Dicey, or the swinging saloon of Mr. Bessemer, must make sad havoc of such an argument, and suggest that our vastly increased wealth had brought its usual accompaniment of increased softness and luxury.

Although it cannot pretend to much of the heroic, it must be confessed, however, that there are few pleasanter pastimes than summer sailing round the softly picturesque shores of Southern England. We cannot praise the taste of one gentleman, who anchored his fine schooner of over three hundred tons in the most snug berth of a West-country port about the end of May, and remained there under pretence of fitting out until the second week in September, when he started only for a perilous voyage back to his winter moorings. He had his reward, no doubt, in the respectful admiration of the townspeople, and the applauding crowd which used to listen to his band playing of an evening; but except the white shoes and the blue costume, he might equally well have been a local benefactor while occupying the first-floor of the chief hotel. But this appetite for the lotus is excessive, and is as much an extreme phase in one aspect of yachting as a voyage to New York is in the other. The average owner of a vessel does move lazily about from one regatta to another, and does not object to running his chance of a strong breeze now and then, when he cannot conveniently avoid it. No other amusement commends itself to so many various dispositions of the mind; for the despotic, the adventurous, the broadly social, and the romantic faculties are equally gratified by being brought into play. Most people have at some time of their lives paid a visit to a man-of-war, and come away with the impression that the captain on the quarter-deck is placed on the proudest pinnacle of human greatness. Comparing great things with small, the owner of a yacht may also enjoy something of the sweetness of absolute power. The Channel is not a vast expanse of ocean, but just for that very reason and the consequent rapidity of the tidal currents it may by certain winds be worked up into a very troublesome sea. The first time that a yachtsman finds himself face to face with a huge wave, he is forced to draw a most uncomfortable comparison between the evident strength of the water and his own apparent weakness. But supposing his vessel to be sound, and his crew composed of the usual quick handy sailors, he soon gets to enjoy the buoyant ease with which the pigmy rides over the giants. There is little of the direct hitting by which a steamer goes straight at the seas, but his helm is delicately handled, and the little ship comes up to the wind and falls away from it as she zigzags cannily over one roller after another. The social phase comes out more strongly in the small boats of twenty or thirty tons or under than in the larger yachts. A numerous crew must have a captain, and probably a mate, interposed like a bulkhead between the owner and his men. Yet even between twenty-five sailors, which would be the complement of a very large yacht only, and their master, there must be much more sympathy when shut up together and exposed to a common danger than there would be between employers and employed under almost any other circumstances. With a small craft the separation becomes physically as well as morally impossible. The owner is his own captain, and could not possibly treat with a grand air the men who have to shout warnings to him quite as often as he directions to them, and who sleep in the fo'c's'le, which is separated little more than in name from his own cabin. The romantic aspect of summer sailing includes the artistic and the picturesque. Some call mystery the essence of romance, and there is nothing so full of mystery as a dream; yet it can hardly be said that the man who lies on his back on deck, as many do throughout a long summer day, in a dreamy daze, enjoys to the full the romantic pleasures of yachting; for, in truth, nothing can be prettier than the

succession of pictures constantly passing before the eyes during a sailing cruise even of the shortest. Many scenes group better as seen from the water than from any other point of view. This does not apply to grand cliffs, which seaward are dwarfed into tameness by the respectful distance at which you are obliged to contemplate them. But what can be found more graceful than the entrance to Cowes or Dartmouth, more fairylike than the reflected lights of Torquay when you glide round the breakwater late on a summer evening, or softer than the swelling roll of hills on all sides of Falmouth Harbour? Then you carry with you a constant and yet ever-changing foreground, and the sharp line of the masts, and bellying of the sails, as the wind fills them now upon one tack now upon another, give the needful precision to the composition. The sailors, when a little foul weather has dulled the commonplace neatness of their trim apparel, fall naturally into useful groups, and more than one famous artist has gained his reputation mainly from his practical experience of casual gleams of sunlight on wet shrouds and dripping sou'-westers during a showery day off Cornwall or the Scilly Islands. Like butterflies flitting from flower to flower, the fleet of yachts hovers round the coast, darting into one sequestered bay after another to taste fresh pleasures. Monotony does not weary, when the experience of to-day is never precisely like that of yesterday; unless indeed you are so unlucky as to be becalmed, or to encounter that least pleasant of all incidents of the sea, a heavy fog. The rooms of the floating houses may look small to others, but to the owner, when his various cherished belongings are stowed away on shelf or nail, they represent the most convenient, the most comprehensive, even the most spacious, lodging that the heart of any reasonable man could desire. And with this opinion the mere abstract consideration of a few feet more or less has nothing at all to do; the little cutter, with a general cabin twelve feet by eight, and the luxurious schooner with a principal saloon twenty-one feet square, and sleeping and other accommodation in proportion, are equally palaces of comfort to their happy proprietors.

Yachting has the common repute of being an expensive amusement, but that, in fact, depends very much upon the manner in which it is taken up. Perhaps no men derive so much real enjoyment from amateur sailing as the large class who build or buy their 18-ton cutter at a quiet price, fit her out with an eye to use rather than ornament, and sail her themselves with a crew, all told, of two men and a boy. Such a boat is often to be bought in Western ports, not perfectly new of course, but of good build and sound timber, and with a very fair fit-out of sails, for about one hundred and fifty pounds. The same kind of boat, but daintily fitted up, and with all the latest ingenities, may likely enough cost four hundred pounds or even more. The usual weekly expense of such a little craft and her owner will not exceed five pounds, while the extras in the way of spinnakers or other fancy sails, entries at regattas, and champagne luncheons, may be very moderate also, or may easily be run up into a tolerable sum. As a rule, sailing on a larger scale than this does imply considerable outlay, unless you are so fortunate as to have an anchorage under your own windows, and so to be able to utilize your crew for other than purely nautical purposes. Without this a boat even of forty or fifty tons must eat up a good bit of money, while from seventy tons upwards you begin to enter upon the inevitable costliness of a large yacht. Of course it may occur that on board a vessel of two hundred tons a man is saving money by giving up much larger expenses at home, but this sort of thing hardly comes under our notion of a summer's sail; it is too much of a business. No man would be likely to set up his ship, at least he would be a fool if he did so, without seeking in the *Pied* and elsewhere the sound and practical and thoroughly trustworthy information which such sources supply; but he will say at the end of his first season that his little bout of practical experience has taught him a good deal more. The general impression seems to be that from thirty to a hundred and thirty tons a yawl is at once the cheapest and most comfortable rig, large cutters requiring such a number of hands to get in their mainsail; while, above that tonnage, a schooner is the more handy. The prevalent danger to the pocket would appear to be the mania for alteration which seems to haunt the owner of a yacht. She is lengthened, she is strengthened, she is deepened; her bulwarks are heightened, until little of her original framework is left, and, the cacœthes of building having gained a firm hold of her owner, he finally orders a new vessel, and has to pay for her, with his already half-emptied pocket, at the rate of nearly thirty pounds a ton. A first-class yacht can always be hired for the season fully manned at one pound per ton per month, the hirer having to find food for no one on board except himself and friends. As this sum is to include compensation to the owner for the use and wear and tear of his vessel, it follows that the actual cost to him is very considerably less. This may serve, so far as it goes, as a general guide to probable expense, but is only of value to enable an intending sailor to fix the probable size of his vessel. He will have no difficulty in then calculating with his builder the precise amount of first outlay, and arriving with the experienced advice of some friend at a fairly accurate estimate of maintenance. If all this falls within the sum which he is willing to spend on his holiday, he has only further to choose with extreme caution the men upon whom his comfort and safety will depend. The owner of a yacht has the absolute power of the captain of a man-of-war only so long as he does not require to exert it. Should he do so, he will find the want of a Mutiny Act fatal. Yet uprisings on board a yacht are almost unheard of; this results in some degree from the good

feeling of the owner, more from the knack possessed by the average captain of Squadron reputation, but most of all from the care with which the crews are chosen.

We have not touched upon racing, as that differs from summer-sailing as much as an afternoon's ride on the Surrey downs does from a struggle on Newmarket heath. A great deal more pluck and skill and a vastly greater expenditure are of course required, but every faculty must be in perpetual strain, and the balmy delights of perfect indolence, which yet fancies it has something to do, are banished. The inevitable thorn clings to our rose, we must acknowledge; the accommodation for sleep and for dressing is often limited, and the cookery is not even third-rate. There are methods of taking a bath more agreeable than standing in nature's dress upon deck, while a sailor scours you with buckets of sea-water; and it is annoying if you have gone overboard, when your boat is anchored in a swell, to find your swimming powers exhausted, and the side of the vessel reached, only to see the gangway rolling up far above your head. Those who cannot get over such inconveniences as these had better abstain from yachting; the confirmed dyspeptic had better do so likewise. But people of ordinary digestion, and no invincible repugnance to a little roughing it, can hardly spend a few idle weeks better than in a summer sail.

PAUPER GIRLS.

THE Local Government Board may perhaps consider it a mark of innovent curiosity if we ask why so interesting and important a collection of papers as their Report for 1873 should not have been published till September 1874. The Report itself is signed by the late President, and there is no apparent reason why the numerous Appendices should not have been ready early in the year. The use of these Reports is not purely historical; they are also valuable as supplying matter for suggestions as to the future policy of the department. If they are not published till the autumn, neither Parliament nor the press has any opportunity of making such suggestions as regards the current year. The work of the Local Government in 1874 will be almost done before the records of its work in 1873 have been thoroughly studied.

One of the most interesting of the documents printed in this volume is a Report by Mrs. Nassau Senior upon the effect produced on girls by the system of education in pauper schools. It appeared to Mr. Stanfeld that in a matter affecting girls there was room for the kind of inspection which is best conducted by a woman, and the results of Mrs. Senior's inquiry show that this view had a solid foundation. The Metropolitan District Schools, which were the principal field of her investigation, have often been visited by the ordinary Poor-law Inspectors and by the Medical Inspectors, and it is very possible that none of Mrs. Senior's suggestions are absolutely new. But it is a great gain to have them presented with that freshness and completeness which are hardly compatible with long familiarity with the persons and places reported on. An Inspector sees a school year after year, and each year perhaps marks some error that needs correcting or some deficiency that he wishes to see supplied. He is naturally anxious not to prescribe too many changes at once, and he consequently limits his recommendations as far as possible to the points which he hopes to get amended before another visit. When he comes again he perhaps finds that only a part of his suggestions has been adopted, and in his next report he will probably limit himself to insisting on this fact, and to making sure that there shall be no similar neglect in the following year. Thus the Local Government Board and the public have the subject presented to them piecemeal, and though, as an ordinary rule, this is the most likely way of getting practical reforms effected, it does not dispense with the necessity for an occasional survey of a more comprehensive kind. Where girls are concerned there is an obvious advantage in this occasional survey being conducted by a woman. Her recommendations may not always be such as it is possible to carry out in dealing with paupers, but it is important to know how the condition and manner of life of any large collection of girls strike a woman. She is likely to notice points in their appearance and habits which may escape the eye of a man, and though each may be in itself trifling, yet the aggregate of them may largely affect their happiness and their ultimate chance of doing well. No theory of the management of girls can be regarded as beyond the reach of improvement the results of which have not been tested by a woman's observation.

Mrs. Senior directed her attention first to the working of the system in the schools, and next to the after career of the girls who had been placed out in the world. The feature in the Metropolitan District Schools which first calls for notice is the system of classification adopted in them. Girls are separated from boys, infants from elder children, and sick children from those in health. Here the process of classification stops. There is no separation of orphans and deserted children, who are permanently in the school, from "casuals" or children who are only there for such periods, often very short ones, as their parents are in the workhouse. Whether there should be any separation between these classes is a point upon which there is great difference of opinion among the officers of the schools. Those serving in the larger schools, including the whole staff at Sutton, where there are 714 girls, and at Hanwell, where there are 580, are strongly opposed to separation; but a slight numerical majority, including the staff of most of the smaller schools, are in

favour of it. The reasons urged against separation are that the permanent children bring the vagrant children rapidly into order, and that, if the permanent element were trained separately, the schools containing the casual children would become so demoralized that good masters and matrons could not be found to manage them, and that the children themselves would have no chance of turning out well. "I have heard it said," writes Mrs. Senior, "that such a school would be a hell on earth." To us it seems that this last argument really constitutes a conclusive reason in favour of educating the two classes of children separately. The permanent children are the children who have most claim upon the consideration of the Poor-law authorities. They pass the greater part, and often the whole, of their childhood in the workhouse, and, as regards orphans, they are often brought there by no fault of their parents. We have no right to condemn these children to the immense additional disadvantage of associating throughout their school life with a class which embraces the lowest and most depraved of the population. If the casual children, left to themselves, would convert pauper schools into so many hells on earth, they cannot be improving companions for the permanent children. They may fall more rapidly into habits of external order and obedience by being associated with children already drilled, but a great deal of evil may be taught and learnt without any open breach of discipline. There is but little supervision in the playground, or in the dormitories between the hour when the children go to bed and the hour when the officer in charge goes to bed; and during the time spent in one or other of these places there is abundant opportunity for imparting the kind of knowledge which is gained in brick-making and hop-gathering or in tramping about the country. In one school Mrs. Senior saw a child of six years old whose language was so horrible that she had to be sent to the dormitories as soon as lessons were over in order to get her away from the other children. At ten she will probably have learnt to hold her tongue in the presence of the officers of the school, and will keep her oaths and obscenity for the hours when she is alone with her companions. One matron told Mrs. Senior that "the horrors that some children coming from low homes talked of could be hardly imagined." They included things "of which she had no idea till she learnt them from the children." All children are ready enough to learn mischief in this way, and to the children permanently in the school these stories come with all the interest and excitement that belong to pictures of a world outside which is absolutely strange to them and which they must one day enter. The whole experience of other schools and of prisons and reformatories goes to show that the most essential requisite in classifying children is to keep those who know a great deal of evil separate from those who know less. One thoroughly depraved child will corrupt the great majority of those whom she associates with. There is no difficulty in finding teachers for reformatories and industrial schools, and if it were once recognized that the same talents which are needed for these positions are needed for the management of casual children in workhouse schools, they would be obtained with equal ease in the two cases.

Another fault in the district schools is the want of variety of occupation, whether for mind or body. A girl is well taught as regards her ordinary school lessons. At twelve years old she "is able to read and write fairly and do the first four rules of arithmetic; if she has been long in the school, her scholastic proficiency is far beyond this." But she gets none of the practical education that comes from living in a poor home. Everything is provided for her without her knowledge or co-operation. She is part of a large system, and she has nothing to do but to submit to be carried passively along with it. Any one who has ever seen the children of any of these schools will remember the dull and listless look which this mode of bringing up imparts to almost all of them, and the striking difference there is between their appearance and that of the shrewd and quick-witted children of the same age and class who are often to be met with in the streets or in the poorest cottages. A pauper girl has no errands to go on, no cooking to do for her mother, no clothes to make for herself, and the want of these common interests is not supplied by any interchange of active employment in or out of doors. The boys in the District Schools have skilled workmen to teach them trades, they are regularly drilled, and they have the use of a good swimming-bath. The girls have no outdoor exercise except walking, and their only substitute for industrial training is instruction in housework. In a large establishment, however, there is but little work that a girl can do, and if there were, there are rarely any efficient servants to show them how to do it. The wages given are not high enough to tempt really good women servants to take a situation which has so few attractions, and in some cases, though this is always disallowed by the Local Government Board, the places are filled by adult paupers sent from the workhouse. Mrs. Senior suggests by way of remedy for this state of things that pauper schools should in future be very much smaller, so that each house could in a great measure be worked by the girls living in it. The existing establishments she would utilize by making a certain number of them infant schools, to which every girl should be sent for the last two years of her school life to learn how to manage children. The large wards now in use might be sub-divided into houses complete in themselves, so that a school which at present holds five hundred children between seven and fourteen might be broken up into ten schools each holding fifty children of all ages, the elder ones being employed, under proper superintendence, in minding the infants and in doing the cooking

and housework of the establishment. In this way girls would get a really practical training which would be of use to them in after-life, instead of being sent out, as is now too often the case, with all their domestic education still to be gone through.

Mrs. Senior's Report raises many other questions of great interest, into which we cannot now enter. It will be seen that it only deals with the Metropolitan District Schools, which, faulty as they are, are yet an immense improvement on the system of bringing up children in workhouses, which in London they have displaced. In other parts of the country, however, there are a very large number of girls who are still being educated under the old system, and it would be exceedingly interesting to hear Mrs. Senior's opinion upon the condition and prospects of this class of children as compared with those in District Schools. It will be well if the Report of the Local Government Board for 1874 should show that she has been employed during the present year in carrying out this inquiry throughout the rest of England. Unfortunately the delay in the appearance of the Report for 1873 compels us to put this in the shape of a hope, not of a suggestion. Considering the large number of girls brought up at the expense of the State, it is of great importance to know whether they are being dealt with so as to make them industrious, capable, and self-supporting, or so as to bring them back upon the hands of the community as the pauper mothers of a fresh generation of pauper infants.

A SUMMER IN SIENA.

WITH the thermometer above ninety in the shade in Florence and throughout the valley of the Arno, the native Italian, and still more the non-acclimatized Englishman, naturally betakes himself to the cool heights of Siena, standing on one of the many spurs of the Apennines. Three hours' railway journey makes a difference of more than a month in temperature; in other words, the traveller thus easily exchanges July or even August for June. The train begins to climb the mountains at a junction half-way between Florence and Pisa, and thence it winds its way upwards, as only Italian railroads learn how to do, among olive groves and vineyards, with villages looking down from heights above, until an ascent of some thousand feet or more brings the traveller to the rock-hewn walls of the old and warlike republic of Siena.

The ordinary English tourist who, with Murray in hand, rushes in hot haste among churches, palaces, and galleries, cannot enter into the summer life of Italy. To enjoy, or even to tolerate, this sense of supreme sunshine, the sojourner must live as the Italians themselves live; he will do well to rise with the sun, to repose at midday, and then again to take his walks abroad an hour or two before twilight—a time of inexpressible beauty at this season of the year, when nature, stimulated to the utmost, seeks the repose of night. Each quarter of the year has in Italy its peculiar beauty; but winter, the time chosen by the English, is perhaps the least favoured; and spring, though brilliant, is often in its winds biting and bitter; and autumn is apt to be short and sad. But summer is long and glad; the people burst into song as they pass through the streets, the fields and the country paths are bright with flowers, the public markets are redolent with fruits. The only drawback to a summer in Italy is the heat, which the Italians learn to elude by betaking themselves to the Baths of Lucca, to Siena, to Perugia, or to other mountain retreats. The Apennines indeed serve as a pleasant refuge from the purgatory of fire. Hence English artists and others who become denizens in Italy find a summer in Siena, Perugia, Assisi, and other high places favoured by nature as by art, not only endurable, but delightful. Of fever in the chief of the Etruscan cities there can be little fear, and against sunstroke a felt hat and a stout umbrella are sufficient protection. As to Siena, she has special claims as a summer residence, at least for those who study art or delight in scenery. Her school of painting, sculpture, and architecture deserves more attention than it has received, save from students; and the streets, the city walls, the wells, and towers, together with the surrounding country, offer ample and comparatively unhackneyed materials for the sketch-book.

Siena, in what may be termed her physical geography, is situated diversely from her sister city on the Arno. She is set upon a hill-top with cold and arid clays around, while Florence reposes in a valley surrounded by fertile alluvial lands cultivated as a garden. In Florence the eye looks upwards to the hills of Fiesole, San Miniato, and Poggio a Caiano; in Siena the spectator gazes downwards over a wide sweep of valleys broken like a sea troubled by a storm. In Florence the streets are almost as level as if laid on a bowling-green, while in Siena the roads clamber tortuously up the sides of precipices, and suddenly plunge into ravines, so that the passage of carriages becomes difficult, and in parts impracticable. Lastly, Florence has been for the most part denuded of her ancient walls, while Siena, fortunately removed out of the reach of ruthless destroyers and speculative building companies, still retains her old rock-planted ramparts in a picturesqueness which time serves to make only the more venerable.

Yet Siena has suffered change, though more politically and commercially than pictorially. Her two hundred thousand inhabitants are now reduced to little more than twenty thousand, and of her thirty-nine gates only eight are now open. A city thus decimated in her inhabitants and paralysed in her power may be likened to the large, wandering, and half-tenantless structures which travel-

lers nowadays meet with in Italy on every hand; a dead silence reigns in the place of life; footsteps sound strangely and intrusively on floors and ground once too narrow for crowded and busy occupants; in short, quarters which formerly were the rich abode of princes, are now given up to penury, to the uses of a wine-cellar or to the petty traffic of a fruit-stall. Yet such reverses in fortune are found not unfrequently to favour picturesque effects; a ruined tower, at all events, is a better subject for the portfolio than a smart new palace. And here in Siena crumbling walls, grass-grown streets, and whole regions within the walls reconquered by Nature and taken possession of by vineyards and olive groves, bring into close contact city and country life, architecture and landscape, old sculpture and modern costume. It would sometimes seem as if our painters were pleased to prosper as parasites, to feed upon decay, to plant beauty on deformity, life on death. And Italy in general, and Siena especially, has not yet, either as to decay or renovation, passed the point at which the artist can step in and gather for his use fruits which are indeed all but inexhaustible. Greece, Palestine, and some parts of Spain are almost too far gone, and Italy is in danger under threatened improvements of being spoiled. A survey is made for a new street in Assisi, a fresh quarter in Florence is disfigured with dwellings which in Lancashire might be mistaken for warehouses or in Dorsetshire for barns, and in Siena the old fountain in the great square by Della Quercia, one of the most precious monuments in Europe, has been carted away to give place to an emaculate reproduction from the chisel of a modern Italian sculptor. In fact, everywhere the art student returns with a kind of dread to his old haunts; he never knows after the lapse of a few years what havoc may have been made with historic remains.

It is interesting to see how in Siena the old art has been assimilated with the present life and adapted to modern uses. The Gothic Fonte Branda, immortalized by Dante, still yields copious supplies of water to the dwellers of a district who from the time of Catherine of Siena down to the present day still carry on the fuller's trade; and the "Loggia dei Mercanti" retains a stone bench, with masterly figures in high relief by Peruzzi, which still serves as the resting and sleeping place of citizens and contadini, whose rude costumes contrast strangely, yet combine picturesquely with armour-girt warriors and classic-clad senators. The art of sculpture in Siena from the era of the Pisani downwards through the period of the Renaissance, by its distinctive character no less than by its distinguished excellence, will repay all the study which the traveller may be able to bestow. The Cathedral, the Palazzo Pubblico, the Fonte Gaja, with sundry monuments scattered about churches, show how here, as elsewhere, sculpture was the necessary sequel to architecture, and the natural precursor of painting. The three arts, though in sequence, were almost contemporary and always co-operative; they arose out of the Romanesque and the Byzantine, they then passed through a Gothic development specially triumphant in Siena, and lastly under Quercia, Peruzzi, Il Marino, Bazzi, Beccafumi, and others they passed into the Renaissance. This last style has here little local character to distinguish it from the other schools that stand conspicuous as revivals of classic modes, and as reflections of the Roman manner of Raffaele. Certainly the period in Siena of most independence and individuality is the pre-Raffaellite. For though there is reason to believe that Raffaele entered the city, a point at once settled if the tradition be accepted that he assisted in the Piccolomini chapel, yet it is a singular fact that the whole of this district in Central Italy cannot show a single work by the master; while Perugino and Pinturicchio, who preserved the tradition and cherished the spirit of the Umbrian school, hold possession of altars and chapels, as well in the minor as in the greater cities of the Apennines. The tourist may with advantage make Siena, or perhaps still better Perugia, a central point for pilgrimage to the forsaken or desecrated shrines of Sienese and Umbrian art—sanctuaries which are rapidly falling into the possession of soldiery, or are being taken under the so-called protection of the State.

Examples might easily be multiplied of the many ways in which sacred and historic art is absorbed into and sometimes desecrated by the life of modern Italy. Thus over an old city gate may still be deciphered in fresco the Coronation of the Madonna; in the chamber of an edifice now used as a public office is a wall painting of the Madonna enthroned among saints and angels; in the cloisters of a secularized monastery rose trees flourish, and camellias blossom under the open sky, so propitious are the seasons. In another monastery, now used as a poor-house, old women are seen knitting before a grand composition, the joint product of Perugino and Bazzi; while upstairs, in rooms once the cells of monks, pauper beds are placed before a picture of the Annunciation, and dirty clothes are stowed away in front of Christ rising from the tomb. And so little account is taken of such treasures that any traveller intent on hunting out works not quite as conspicuous as the dome of St. Peter's in Rome is met by a positive denial of their existence altogether. A light-hearted indifference and an easy-going frivolity permit an Italian to smoke a cigar or to drink a cup of coffee over the destruction of the most precious work inherited from his ancestors, and the scene in which Charles Surface sells the portraits of his forefathers is enacted to the life at this moment in Italy. It is only the resolute and praiseworthy resolve of the Government to house in Museums created for the purpose the suddenly mobilized treasures of disendowed fraternities that hinders pauperized monks from turning pictures into ready cash. Fortunately there yet remain in Siena some monumental works

which, amid the catastrophes of centuries, maintain their original uses. The cathedral and its contents are, with some exceptions, such as the restoration of the pavement and of the façade, intact. The Palazzo Pubblico preserves, though in ruin, Lorenzetti's famous fresco symbolic of Good Government, a work which may possibly serve as an incentive towards honesty to the municipal clerk who, in the presence of these majestic figures, is seen registering papers in small pigeon-holes. But more to the immediate purpose of present times are the frescoes which cover the vaults of the great hospital. In the wards may be seen to this day pictures of the Madonna of mercy looking down on beds of sickness. Seldom has religious art been more appropriately exercised.

A summer is scarcely too long to master Sienese art. Many days may with advantage be spent in the picture gallery, wherein can be traced the rise of this local art out of the Byzantine school under Guido da Siena and Duccio, its progress under Ambrogio Lorenzetti, Simone Martini (called Simone Memmi), Taddeo di Bartolo, Sano di Pietro, Pacchiarotti, and so onwards, and in some sense downwards, to Bazzi (called Sodoma), Beccafumi, and Francesco Vanni. Many of these artists may be further studied by visits to such of the churches as have not been despoiled of their treasures. And all the more is to be learnt here on the spot, because these masters are almost exclusively local; with comparatively few exceptions they are not to be seen elsewhere. Moreover, the school has special claim to attention from its devout religious feeling, from its tenderness of expression and its subtle supersensuous beauty. Also an interesting trait, evidently taken from Byzantium, is its supremely decorative character manifested through profusion of gold in backgrounds, in "glories," and in highly wrought draperies also decorated with gold into which enter overlappings of transparent red or purple. Even the frames, in their elaborate Gothic archings and pinnacles, and twisted columns, enclosing sometimes ten or more panels bound together into one composition, are exquisite in design and ornament. Frames thus treated become in fact integral portions of the pictures they enshrine. Such works are obviously best seen in the places for which they were originally designed; they then are found to combine fitly with architectural surroundings; hence the advantage of studying these somewhat anomalous products in the churches as well as in the galleries of Siena. The volumes of Messrs. Crowe and Cavalcaselle will prove instructive companions, though these searching but supercilious critics, who everywhere overthrow much more than they succeed in establishing, show more favour to Florence than to Siena.

We must not forget to point to the remarkable manifestations of Gothic architecture of which there is scarcely a street that does not bear the signs down to this very hour. Indeed Herr Burckhardt goes so far as to say that no town in Italy or Northern Europe, neither Florence nor Venice, neither Nuremberg nor Bruges, is so rich in remains of pointed architecture as Siena. The merits and the demerits of the cathedral are pretty generally known, and the Palazzo Pubblico (date 1289-1305) is too large to have escaped the notice of the most rapid of travellers; but over and above these signal examples there exist not only such palaces as the Saracini, the Buonsignori, and the Tolomei (date 1205), but a multitude of minor dwellings, and two or more fountains such as the Fonte Branda (date 1198) and the Fonte Nuova (date 1259), which tell unmistakably of a great Gothic epoch. What would we not have given to have seen Siena in those days! Now, in the domestic dwellings at least, the pointed arches are mostly filled up to give place to small and utilitarian square windows. We have seldom seen a city in which a careful study of masonry would lead to more interesting archaeological results, though perhaps in the end the conviction would be forced upon the inquirer that there are but few traces of Byzantine or Romanesque structures, that the Gothic development wants the growth and variety of the same style in Venice, and that the Renaissance has little to urge in excuse for having thrust itself in as an untimely intrusion.

A summer in Siena would scarcely be complete without excursions to some neighbouring centres of art. The railway has now made more accessible the Convent of Monte Oliveto planted in the midst of wild Dantesque scenery, and though the monks are removed, hospitality is continued by order of the Government to strangers, including ladies. Here on the walls of the great cloister are still preserved the master-works of Signorelli and of Bazzi. The traveller will also do well to visit the picturesque little town of San Gimignano for the sake of famous frescoes by Benozzo Gozzoli, and, should the summer heats in Siena become insupportable, the tourist or student may beat a retreat to the cool Etruscan heights of Volterra.

THE MORAL EDUCATION OF THE PARISIANS.

THE praiseworthy movement in favour of young Englishwomen left unprotected in Paris seems to have stirred the susceptibilities of some patriotic Frenchmen. The speakers at the Manchester meeting incidentally assumed the exceptional immorality of Paris to be indisputable, and the Bishop of Manchester appears to have given especial offence by observing that it was not the safest place in the world for a young woman to be abroad in. Whereupon an ingenious writer in the *Temps* takes up the cudgels for the French capital, and sets himself to establish two propositions. The first of these is, that Parisian immorality has been grossly exaggerated; the second, that even if the city be as immoral as is asserted, it is the strangers who denounce it who are chiefly to

blame. With regard to the former point it is likely enough that the Parisian apologist may be in the right, although we may observe that, even if the general indictment were toned down materially, enough would remain to support a damaging charge. The proverb assures us that the Author of Evil is not so black as they paint him, and the Parisians have taken especial pains to blacken themselves out of the perverted vanity which is one of their foibles. Like a *roué* whose head is worse than his heart, they take a pride in romancing about the things that do them least credit, and would willingly be supposed to excel in those kinds of wickedness which are the weaknesses of gay and brilliant natures. Victor Hugo, a born Parisian himself in temperament if ever there was one, believes in the Parisians and admires them as much as any man. Witness the rhapsodies in which he indulges in his writings generally, and especially in the chapters on the sun and centre of civilization which he contributed to the guide-book for the last great Exhibition there. Yet even Victor Hugo in his latest novel talks of Paris oscillating between Thermopylæ and Gomorrah, an epigram which a cautious Englishman would scarcely have hazarded. Take their sketches of themselves as accepted by themselves, in the novels that have been most widely read and the plays that have had the longest runs. Even according to those who write mainly for the more virtuous middle classes, and seek their personages there, neither the spoiled children of a luxurious aristocracy nor the drags and scum of criminal society have any monopoly of vice. Honest Paul de Kock sent out his shopkeepers of the Marais on a Sunday, like so many *bourgeois* Don Juans, conquering and to conquer; they sought their prey among each other's wives and daughters in the intervals which they snatched from business, without paying any regard to the rites of hospitality; while his grisettes and girls of the people were "gay" as a matter of course. But Paul de Kock was a model of morality compared to the more refined school which succeeded him, and the society he delighted in depicting was comparatively pure. If we may credit some of the most popular novelists of the Empire, the highest practice of morality had come to be identical with the art of keeping up appearances, and society generally by a tacit and honourable understanding screened notorious branches of the Seventh Commandment from the knowledge of those who should feel bound to notice and resent them.

No doubt these pictures are over-coloured, and French writers have often deliberately calumniated their countrymen that they might pander to a depraved and prurient taste. But the fact that their books found a ready market proved the general existence of that prurient taste. The evil reputation which Paris has made for itself has a solid foundation in the qualities on which the Parisians pride themselves; and from time immemorial they have had examples before their eyes which might well have corrupted even a people more virtuous by temperament. Their gay and light-some natures are the least suited in the world to resist the temptations with which they industriously surround themselves. It is the old story:—

Where lives the man who has not tried
How nith can into folly glide, and folly into sin?

In other countries there have been dissipated kings and courtiers who paid their monarch the flattery of imitating his vices. But, with the exception of the Italian States, where the way of living was often loose enough, princes did not systematically assert their superiority to ordinary restraints by flaunting their vices in the eyes of their subjects. In Germany, in England, and even in Spain an obtrusively immoral king rather acted the part of the drunken Helot in Sparta, and shocked his subjects into more decorous manners. In France a dissipated Court has been the rule which has been proved by occasional rare exceptions, and Paris has long been familiarized with scandals that dazzled it. We need not go back to Charlemagne with his daughters carrying their lovers on their shoulders across the fresh-fallen snow, nor to those mysterious atrocities of the Tour de Nesle which recall the infamous horrors of the Lower Roman Empire. The best and ablest of the French kings have been the worst men and the worst husbands. The secret history of France's most brilliant days has been the history of mistresses with their *cotillon* government. The chivalrous Francis was more famous for his amours than for his successes in the battlefield; his son inherited the favourite mistress with the royal crown, and no one was greatly shocked or surprised. Catherine de' Medici availed herself of the charms of her maids of honour to ruin or hoodwink the courtiers she distrusted. As for the great Méarnais, the *protégé* of the austere Huguenots, the convert of the Pope and the Catholic clergy, he was as openly disreputable in his life and morals as any of his subjects, which is saying a great deal. The descendants of his branch of the Bourbons showed themselves his worthy lineage in that way, if in no other, and the greatest of them even succeeded in improving on their ancestor. The Great King *par excellence*, who lived as he died under the eyes of his faithful subjects, who made it his ambition to occupy the attention of all Europe, travelled to the camp attended by carriages filled with his favourite sultanas, while the Queen of France was left to pray for him in her oratory at home. The Regent Orleans made his household arrangements a byword, and his chosen friends were honourably distinguished as *roués*; while Louis the Bien-aimé busied himself through his long reign in developing the Oriental tastes of his grandfather, and seizing on daughters of the nobility or the people whenever a face attracted his fancy. Louis XVI., heavy in his looks and ungainly in his bearing, was the only moral man of his line, and he came to the

guillotine in retributive justice for the sins and scandals of which his fathers had been guilty. Now all these later princes kept their most discreditable establishments within easy reach of Paris holding their orgies in the full blaze of their kingly state and ceremony. Versailles, Marly, and the Château of Obois were all close to the town; while the favourite haunt where the Regent held his entertainments was in the heart of its gayest and busiest quarter. The Royal example was loyally imitated by the nobles. They had their *petites maisons* in the precincts of the Court, and abused their seigniorial rights in their own domains as audaciously as their Majesties themselves could have done. Had the Parisians been as steady and phlegmatic as their Teutonic neighbours, they could hardly have resisted the influence of such constant corruption and the demoralizing effect of such examples in high places. Being what they are, they have naturally been formed by it, and if they should be forced in candour to admit this, we readily confess that they may plead extenuating circumstances.

After all, however, what we are more concerned with is the Paris of our own times. It is of course still suffering under the consequences of the German invasion, but we cannot see that its sufferings have materially changed its character. It would willingly, if it could, be again what it was under the Empire, and we have not forgotten what Parisian life was then. It was outwardly more decorous than it had been under the old monarchy, for Courts and princes had come to conduct themselves with more decency and reserve, and the progress of refinement and the growth of public opinion insisted on a certain respect being paid to appearances. But in one way things were worse than they had ever been before, and, thanks to the general increase of riches, many people could afford to indulge themselves in vices which had formerly been a monopoly of the privileged few. Under the Second Empire no man, however highly placed, would have dared to hold his revels behind windows opening on the crowded streets, like the Regent Orleans or even Philippe Egalité. But then every little *bourgeois* gentleman who longed to be gay and get rid of his small fortune found every facility afforded him. So long as his louis lasted he might shine in certain circles, and be pillaged at nightly card-tables by the harpies who consented to pluck him. As the victims gathered to Paris so did the harpies, and as the harpies came there so did the victims, and things went on revolving in a vicious circle which was gradually extending itself. There was no other capital where a stranger could so easily launch himself among the wilder pleasures, or form a certain acquaintance with distinguished patrons of immorality. All classes met, for example, in the *foyer* at those early morning balls at the Opera House. A false air of respectability was thrown over these extraordinary gatherings by the fact of the Opera being the habitual resort of the most unimpeachable society, and consequently comparative innocence was seduced into most dangerous contact with shameless vice. Mere children might be seen looking on from the side boxes, brought there apparently to amuse themselves innocently with the profitable spectacle. It arose naturally perhaps out of the practice of these Opera balls that a certain number of highly-placed Parisian gentlemen dared to give the ladies of the demi-monde a magnificent ball at the famous restaurant of the Trois Frères Provençaux. The ball became town-talk, among men the rush for tickets was tremendous, and if ladies in society did not venture to apply, they consoled themselves as best they could by informing themselves of all the minutest particulars of the affair. Our golden youth in London are perhaps not too particular in their habit of addressing Anonyms in the Park, under the eyes of their mothers and sisters. But can we conceive such a ball as we hint at being tolerated in London or Berlin, and being countenanced freely by officials in high places and respectable fathers of families? Can we imagine the proprietors of the most fashionable restaurant in London consenting to let it for such a purpose? But then in Paris they are used to these things, and restaurants of European reputation are permitted to change their tone according to the hour of the day and the character of the guests. The *salons* of the Maison Dorée, the Café Anglais, are patronized in the early evening by staid and sober domestic groups. In the early morning the same rooms will be filled with very different company. We repeat that, putting it in the mildest way, the tone of Parisian morality is extreme toleration, and, according to English notions, it leaves a good deal to desire. Does not M. Taine tell us that a good son will make his mother his confidante as to his mistresses? Consequently, notwithstanding the attempt of the dashing writer in the *Temps* to carry the war into the enemy's camp, we rather agree with the Bishop of Manchester in thinking that Paris is not the safest place for a young and unprotected woman, and we are sure that the returns of English corpses dragged out of the Seine, to be exposed in the Morgue, should be the most eloquent of advertisements for such a home as is proposed.

LOCAL FÊTES.

THE efforts of country places in the matter of local fêtes and shows are often beset with difficulties. The great people, who have seen the best of everything in Paris and London, give their money sparingly and their energies with languor, or it may be that certain of the more good-natured ones kill the whole affair by their superabundant patronage, as nurses stifle infants by over-care. The very poor can only participate to the extent of peace

when the thing is organized; they can neither subscribe for the general expenses, nor give time to the arrangements; and the burden consequently rests on the shoulders of the middle class, which in a small country neighbourhood is represented by the well-to-do tradesmen, the innkeepers, and the rival professionals. Once a year or so the desire fastens on these people to get up a local fête—say a flower-show, or games, or both combined—as an evidence of local vitality, a claim on the county newspaper for two or three columns of description with all the names in full flanked by a generous application of adjectives, an occasion for mutual self-laudation, and a pleasing impression of the eyes of England being turned upon them. They find their work cut out for them when they begin; and before the end most of them wish they had never been bitten by the mania of parochial ambition, but had let the old place lie in its wonted stagnation without attempting to stir it at the cost of so much vexation and thankless trouble.

Jealousy and huffiness are the dominant characteristics of small communities, as all people know who have had dealings therewith. The question of precedence affects more than the choice of the "first lady" in an assembly where there are no ladies to be first, though there may be plenty of honest women; and the men squabble for distinctive offices and the recognition of services to the full as much as the lawyer's wife squabbles with the doctor's, and both with the wholesale grocer's, as to which is to be taken down first to supper and set at the head of the table with the master of the house. One wants to be the secretary, that he may display his power of fine writing when he asks the reverent nobility and gentry for their subscriptions, and draws up the final report for the press. Another thinks he should be made chairman of the acting committee, because he imagines he has the gift of eloquence, and he would like to use the time of the association in airing his verbiage. A third puts in his claim to be elected one of the judges of things he does not understand, because his son-in-law is to be an exhibitor, and he would be glad to be able to say a good word for him; and all decline those offices which have no outside show, where only work is to be done, and no credit gained. It requires a considerable amount of tact and firmness to withstand these clamorous vanities, to put the right men in the right places, and yet not make enemies that will last a lifetime. But if the thing is to succeed at all, this is what must be done; and the little committee must stick to its text of *pro bono publico* as steadfastly as if the flower-show were a conqueror's triumph, and the rules and regulations for its fit management consular decrees.

When the eventful day arrives, every one feels that the eyes of England are indeed turned hitherward. The great people are languid, the meaner folks are jocular, and the stewards are as proud as the proudest rediles of old Rome. Their knots of coloured ribbon make new men of them for the time, and justify the instinct which puts its trust in regalia. They are sure to be on the ground from the earliest hours in the morning; and though scollers might perhaps question the practical value of their zeal, no one can doubt its heartiness. If it is fussy, it is genuine; and as every one is fussy alike, they cannot complain of each other. A band has been lent by a neighbouring regiment, and the men come radiant into the little town. It is delightful to see the cordial condescension with which the trombone and the cornet, the serpent and the drum shake hands with their civilian friends, and how the fine fellows in scarlet accept drinks quite fraternally from fustian and corduroy. For a full half-hour the town is kept alive by the dazzle and resonance of these musical heroes as they stand before the door of the "public" which they have elected to patronize, and lighten the pockets of the lieges by the successive "go's" drained out of them. Then the church clock chimes the appointed hour, the last flag is run up, the finishing touch given to the calico and the moss, the last award has been affixed, and the policeman stationed at the gate to keep order among the little boys has tightened his belt and drawn on his gloves ready for action. The band marches through the town, drums beating and fifes playing, and when the gates are opened as the clock is on the stroke of twelve, they are all settled in their places with their music handy, ready to salute the gentry with the overture from *Zampa*, taken in false time. The imposing effect, however, is rather marred by the friendly feelings of the public; for when jolly farmers and small boys insist on sharing the benches assigned to the red coats, the orchestra has necessarily a piebald kind of look that does not add to its dignity.

The great people do their duty as they ought, and come in their carriages, which make a show, and give an air of regality to the affair. Many of them have had early high-priced tickets given to them in consideration of their subscribed guineas; it being held the right thing to do to give to those who can afford to pay, trusting to the pence of the multitude for the rest. Nevertheless they regard their presence there as a *corde* which they must fulfil, but at the least cost possible to themselves; so they make up parties to meet at a certain time, and endure the stewards, who talk fine and are important, with the best philosophy granted them by nature. When the second prices come, then the real fun of the fair begins. The great people are uninterested, and the indifferently grown flowers which are offered for prizes do not call forth any enthusiasm, but the smaller folk think them superb, and express their admiration with unstinted delight. When the gardener of a neighbouring lord exhibits a good specimen from his choicest plants, not for competition, but as a model for imitation, their enthusiasm knows no bounds; and a fine alameda or a richly-coloured dracena receives almost divine honours. As

a rule, the flowers in these local shows are poor enough; but the fruit is often good and the vegetables magnificent. The highest efforts of competition are usually devoted to onions and beans; but potatoes come in for their due share, and the summer celery is for the most part an instance of misdirected power. The great houses carry off the first prizes, the poor little cottage plots, cultivated at odd hours under difficulties, not touching them in value. The gentlemen say they give their prizes to their gardeners; but that does not help the cottagers who have spent time and money and hope in this unequal struggle of pignies with giants. In some places they divide the classes, and give prizes to the gentle-folks apart and to the cottagers by themselves. In which case they fulfil the Scriptures literally, and give most to those who already have most.

All the local oddities are sure to be at these fêtes. There is the harmless imbecile who wanders about the roads with a peacock's feather in his battered old cap, and who talks to himself when he cannot find another listener; and there is the stalwart lady proprietor who farms her own land, and knows as much about roots and beasts as the best of them. She is reported to have thrashed her man in her time, and is said to be a crack shot and the best rough-rider for miles round. There is the ruined yeoman who came into a good property when he was a handsome young fellow with the ball at his foot, but who has drunk himself from affluence to penury, and from sturdy health to palsy and delirium tremens, yet who has always a kindly word from his betters, having been no man's enemy but his own, and even at his worst a good fellow in a sort of way. There is the farmer who is supposed capable of buying up all the lemming gentry in a batch, but who, being a misogynist, lives by himself in his rambling old ruined hall, with a hind to do the scullerymaid's work, and never a petticoat about the place. There is the self-taught man of science whose quantities are shaky when he tells you the names of his treasures, but whose knowledge of local fossils, of rare plants, of concealed antiquities, is true so far as it goes, if of too great importance in his estimate of things; and side by side with him is the self-made poet, whose verses are not always easy to scan, and whose thoughts are apt to express themselves mistily. These and more are sure to be at the fête bringing their peculiarities as their quota, and giving that indescribable but pleasant local flavour which is half the interest of the thing.

There is a great deal of practical democracy in these gatherings, if the grand people stay into the time of the second prices, which, however, they generally do not. If they do, then ragged coats fledge the squire's glossy broadcloth, and rude boys crumple the fine silks and mashings of the ladies with the most communistic unconcern. The shopgirl and farmer's daughters come out in gorgeous array, with bonnets and chignons, straw-bers and furbelows, of wonderful construction; and their sisters of more cultivated taste regard their exaggerated toilets as moral crimes. But the poor things are happy in their ugly finery, and, as millinery is by no means an exact science, they may be pardoned if they adopt monstrosities on their own account which a year or so ago had been sanctioned by fashion. Sometimes Punch and Judy, "as performed before the Queen and Prince Albert," helps on the enjoyment of the day, with the "—" softened out of respect for the clergyman; sometimes an acrobat lies down on the grass and twirls a huge ball between his feet, which sets all the boys to do the like in imitation, and perhaps brings down many a maternal hand on fleshy places as the result; or in some localities a troop of little girls in scarlet and white plait ribbons dance round a maypole and are called inappropriately morris-dancers. Perhaps there are fireworks at the end of all things, when the set pieces will not light simultaneously in all their parts, the catherine-wheels have the disastrous trick of sticking, and only the Roman candles and the rockets succeed as they should. But the gaping crowd is vociferous and good-natured, and holds the whole affair to have been splendid. There is a great deal of coarse jollity among the men and women over the failures and successes alike, and if the fête is in the North there is sure to be more drink afloat than is desirable. Headaches are the rule of the next morning, with perhaps some things lost that can never be regained; yet, in spite of the inevitable abuses, these local fêtes are things worthy of encouragement, and perhaps if the great people would enter into them more heartily, and remain on the ground longer, the lower orders would behave themselves better all through and there would not be so much rowdiness at the end. It does not seem to us that this would be an unendurable sacrifice of time and personal dignity for the pleasure and morality of the neighbourhood where one lives.

THE LUXEMBURG ROUTE.

A TRAVELLER'S complaint in the columns of the *Times* rather understates the case against the managers of the Luxemburg line of railway. This line forms part of the route between London and Basle by Ostend and Brussels, and we assume that its managers, or, in other words, the Belgian department of State which administers railways, are responsible for the advertisements which invite tourists to adopt this route. The same responsibility certainly rests upon the two English Companies which carry passengers on another part of this route; and it deserves their attention that, whereas both first and second class through tickets can be bought in London, only first class through tickets can be bought in Basle, and within this week no

through tickets could be bought at all. To many persons the saving of 1*l.* or 1*l.* 10*s.* in this journey is important, and nobody would suspect, until warned by experience, that an economy which is practicable between London and Basle is impracticable between Basle and London. All those who are concerned in holding out an illusory representation are responsible for the disappointment and loss which it occasions, and as the advertisements of this route are somewhat pretentious, those who issue them should take care to provide all that is promised either expressly or by reasonable implication. There is, or was, a slightly absurd paragraph stating that "special arrangements for breakfast" had been made at the Brussels Railway Station, which appeared to mean only that the usual coffee-pot and a milk-can were provided in the refreshment-room. This, however, was a merely harmless flourish. But when it is stated that a second-class through ticket can be bought in London for 3*l.* 9*s.* 0*d.*, and that first-class fare must be paid on the night train between Brussels and Luxemburg, it is natural to assume that the same ticket, with a similar qualification, can be bought in Basle; and this cannot be done. It is true that after a little experience the grievance may appear trifling. There is time and opportunity to take a succession of tickets at Basle, Metz, Luxemburg, Brussels, Ostend, and Dover; but the object of such advertisements is that to which we refer to attract the inexperienced by promising to remove little difficulties which to them seem great. It is scarcely honest to assist travellers on their way out, and allow obstacles to be interposed on their way home, and thereby entail unexpected and perhaps inconvenient charges. There is a sea-side place in Wales to which a coach used to run as long as visitors were going thither, but it did sometimes happen that the coach was taken off before the visitors had all returned, and the residue were put to the expense of posting.

The complainant in the *Times* appears to possess more than that average amount of ignorance and weakness for which we think that the managers of these lines ought to make provision. He says that the advertisements for the present month offer through tickets (first-class) for 12*l.* 4*s.* at Basle, but that he was charged 130*fr.* We believe that the price has always been the exact equivalent in francs and cents, for 4*l.* 10*s.* 9*d.*, and if he was charged and paid more, he was the victim of an impudent extortion, which he ought to have resisted. The price for these tickets is, if we do not mistake, posted up near the bureau, and if he had appealed to a printed notice, a claim in excess of it would not have been persisted in. Then he says that the advertisement promised 56 lbs. of luggage free, but he was charged for every pound of luggage. If he had taken a bag or portmanteau of moderate size into the carriage with him nobody would have objected, but if he chose to register his luggage, it is likely that he would be charged with the whole weight of it. The advertisement probably means only that luggage under the named weight may be taken in the carriage free of charge. He further complains that he found it "all but impossible" to get refreshments between Basle, which he left at 3 p.m., and Brussels, which he might have reached at 7 a.m. And here we think that he demands too much. A more prudent traveller, if he could not do without refreshment, would carry it along with him. There are not many places in England where good coffee or soup can be obtained at night on a railway journey, and it scarcely seems reasonable to expect to find such places more plentiful abroad, where the habit of night travelling prevails so much less than among ourselves. Strasburg is less than four hours from Basle, and after passing it there is little or no opportunity for refreshment until Metz is reached in five hours more. The first halt occurs, it may be said, too soon, and the second is somewhat late; but persons who cannot travel for eight or nine hours without eating and drinking should carry supplies with them. The refreshment-room at Strasburg is inconveniently distant from the platform, and it may be conceded that the architect insufficiently considered the wants of Englishmen travelling from Basle to London. However, coffee can be procured certainly at Metz at 11 p.m., probably at Luxemburg at half-past 12, and certainly at Namur at 5 a.m. It is needless to add that at all these places and some others beer may be procured, or a bottle of wine may be bought and taken into the carriage, and bread, meat, and fruit may be bought at nearly all of them. It should be remembered too, that the food which we buy abroad can generally be eaten, which is more than can be said for the sandwiches and buns of Mugby Junction. On the whole, therefore, the line between Basle and Brussels can scarcely be said to traverse a desert, and we observe that the complainant mitigated the hardship of his peculiar case by sleeping at Luxemburg, which he would reach half an hour after midnight. He could have taken, if he had pleased, a solemn lunch or dinner at a table-d'hôte at Basle at half after noon. He might have taken coffee, perhaps rather hurriedly, at Strasburg, and he might have taken coffee again at Metz; he might have carried wine, water, or lemonade in the carriage with him; and he might even have practised a little abstinence without injury to his health. We scarcely think these trivial deprivations deserve to be called "misfortunes" to which all travellers on this route are liable. The aggrieved gentleman will at least have reason to be thankful if he never meets any worse "misfortunes" in travelling.

His letter, however, mentions a further incident of some importance which curiously illustrates the character of Belgian railway management. His book of coupons had been lost by the clumsiness of the guard of the train; he was made to pay the fares for which the coupons were provided; and when he applied for

redress at Brussels, he was received by the chief of the station "with the manners of a duke and the urbanity of a Prime Minister," but up to the time of writing to the *Times* he had not got redress. The politeness of Belgian officials is not merely on the surface. They really intend and desire to assist, but they are marvellously slow and rather obtuse about it. An instance somewhat similar to that mentioned by the correspondent of the *Times* occurred to another traveller. Being unable in the dusk to select the proper coupon for one stage of the journey between Ostend and Brussels, he handed the book to the guard, who took from it a wrong one. At Brussels the traveller discovered the mistake and endeavoured to get it set right. The coupons were coloured yellow. The guard, when applied to, answered by denying that any yellow coupon had been given to him during that journey, and in proof of this assertion turned out his pockets in which were sticking a number of little pieces of green paper, which he seemed to treat as if they were of no importance whatever. The traveller, being in Brussels next day, applied to the chief of the station, was received with the greatest attention and politeness, and was told that if he would take the trouble to call again the matter should be inquired into. The value of the coupon was only a few francs, and the matter was pursued chiefly to see what would come of it. The experienced in such matters will understand that nothing came of it. The chief of the station, when the traveller called next day, was more attentive and polite than before. The guard had been questioned, and had answered that no yellow coupon whatever had been given to him, and the chief seemed to think this conclusive. The traveller pointed out that, if no yellow coupon had been given to the guard, the guard must have allowed him to travel over a portion of the line without producing anything to show that he had paid his fare, and that thus the guard was accusing himself of a distinct breach of duty. But the chief of the station did not seem to comprehend this argument. He simply regretted that nothing could be done. The case is perhaps less strong than that stated in the *Times*, because it may be said that the traveller ought himself to have selected the proper coupon and handed it to the guard, and should therefore take the consequence of the guard's blunder. The correspondent of the *Times* says that at Strasburg the conductor, "in manipulating our books, dropped one of them down the window-frame," and it could not be got out. There seems to have been no need for any manipulation by the conductor. Each traveller should have selected from his book the proper coupon, and handed it to the guard. But still, as the conductor received the book into his hand, he was bound to take reasonable care of it, which he certainly did not. The correspondent applied for redress at Luxemburg, and afterwards at Brussels. He was made to pay the fares which the coupons represented; but the chief of the station at Brussels assured him that, if he would write a statement of his case, the matter should be adjusted. He did write on the 15th September, but had received no reply on the 23rd. Our own observation would lead us to think ten days not nearly long enough for the chief of the station at Brussels to inquire into and adjust a matter of this kind. Our expectation would be that redress would ultimately come, and we do not think it will be hindered by the publication of the complaint in the *Times*.

Persons who desire to spend their annual holiday in Switzerland also desire to get there without unnecessary delay or expense, and persons who are content to travel second-class ought not to be forced or tricked into travelling first-class. We can scarcely, however, suspect the railway managers of a deliberate purpose to exact first-class fares, since it is a fact that during the present week they had omitted to provide first-class tickets. This direct route between Brussels and Basle is certainly not beautiful, and after it has been travelled once or twice it becomes tedious. But it is quick, and it might be reasonably cheap. The managers might do more than they have done to facilitate the journey, and travellers, on the other hand, should not expect too much, nor make an unreasonable fuss over small difficulties and discomforts. Through tickets are a great convenience, but people need not fall into utter helplessness for want of them. Generally speaking, a Continental railway train stops often and long enough for all reasonable purposes, and for one traveller who gets too little in the way of refreshment, it is easily possible for several travellers to get too much.

REVIEWS.

YONGE'S HISTORY OF THE REVOLUTION OF 1688.*

THIS History of the Revolution of 1688 is intended, according to its author, for the benefit of students and teachers who, while they desire a fuller account than the narrow limits of a school history will allow, find "Macaulay's brilliant narrative" too long, and Hallam too purely constitutional. Starting with remarks upon the character and effect of the Reformation in England, and ending with the Peace of Ryswick, which he regards as the period when the Revolution was fairly completed and secured, Professor Yonge has brought within the compass of one small

* *History of the English Revolution of 1688.* By Charles Duke Yonge, Regius Professor of Modern History, Queen's College, Belfast, and Author of "The History of the British Navy," "The History of France under the Bourbons," &c. London: Henry S. King & Co. 1874.

volume a narrative which he considers to be on a scale large enough to give an adequate knowledge of the subject, both in its historical and its constitutional aspects, without being so minute or prolix as to deter the ordinary reader. No doubt there are people who are deterred by the mere sight of a big book; but we should think that any one who had once mustered courage to begin upon the volumes of Macaulay would find them easier to get through than the one compact-looking little book before us. For, though Professor Yonge speaks with respect of Macaulay, and has largely drawn upon him, it is seldom that he succeeds in catching any sparks of the brilliancy he admires. The plan of his work, in which events are grouped not in strict order of time, but according to their connexion with each other, affords, in skilful hands, opportunity for more lively pictures than can be given by the annalistic method, and the scale he has chosen allows of a fair amount of detail. But the style is poor and heavy, even though it is comparatively free from sentences so inordinate in length as some upon which we remarked the last time it fell to our lot to review a book by the same author. With all the pains he takes to explain and describe how things happened, he generally fails to set them clearly and strongly before the eyes of his readers, or to bring out vividly what manner of men were the kings and statesmen of whom he writes. In short, he lacks that dramatic power which, though it is a gift to be used with discretion, is in a certain degree absolutely necessary to the making of an historian even of the most modest class.

By way of compensation, he is sometimes fairer than Macaulay, whom he by no means slavishly follows, and whom he even occasionally corrects. He is sufficiently severe upon King William's faults, and does not attack Dundee and Marlborough with the furious enmity of the great Whig historian. For example, Marlborough's real part in betraying the Brex expedition—an affair in which he showed himself base and dishonourable enough, but not such an utter villain as Macaulay makes him out—is fairly told. And to the general lack of vitality with which the characters are drawn an exception must be made in the case of Louis XIV., whom Professor Yonge, as his readers know of old, hates so bitterly that he rises into unwonted vigour in denouncing him, dwelling with delight upon the undignified fashion in which the Great King flinched from the dangers of battle, and almost grudging him the small praise of having been a generous and magnificent host to the fugitive James of England. Cromwell also is distinctly, but we should say unjustly and unscientifically, drawn. Professor Yonge evidently looks upon him only as the Machiavel or Richard III. of his day, a cunning and unscrupulous schemer for power, bending the whole course of event to suit his private ends. No distinction is made between cases where Cromwell simply acted with his party, or with the army—of which, at any rate at first, he was the leader only on condition of leading it the way it wanted to go—and those where he acted for himself alone. We are told that "he sent Colonel Pride with his troopers to 'purge' the House," as if Cromwell had been the sole and avowed originator of Pride's Purge. He may have been at the bottom of it, but he was at any rate in a position to profess, as Ludlow reports, "that he had not been acquainted with this design," although he admitted that "since it was done, he was glad of it, and would endeavour to maintain it." Then Professor Yonge tells us that "meanwhile he had possessed himself of the King's person, and he now brought him to London to murder him with a burlesque of all the forms of law and justice." A mockery of legal form it may have been, as any imitation may be called a mockery; but a term which implies conscious ridicule is strangely misplaced with regard to so stern and solemn a transaction. One might as well talk about burlesque when Samuel hews Agag in pieces before the Lord in Gilgal. Of Charles II. we are told that his last act was "an avowal on his death-bed of his adherence to the Roman Catholic Church, to which he had for many years secretly belonged." This sounds as if Charles had been moved to make an honest and open confession of faith, whereas all he did was to have a priest smuggled in by the back stairs, from whom to receive the last sacraments in the presence only of a few trusted men. Naturally the fact almost immediately got whispered about, but there was no avowal till James grew bold enough to make it. This latter prince is, we think, rather hardly used in being charged with having compelled his subjects "to identify Popery with tyranny" by, amongst other things, "his persecution of Protestants, whether belonging to the Established Church or Nonconformists." No doubt James would have persecuted Protestants with great goodwill if his subjects would only have waited till he felt strong enough to do so; but they turned him out before he had succeeded even in placing his own religion on terms of equality. There were times when he persecuted Nonconformists; but that would come under the head of defending and supporting the Church of England, not of persecuting Protestants as such. The question, however, depends in great measure on the sense attached to the word persecution. In his account of the proceedings against the University of Cambridge Professor Yonge goes out of his way to cast a doubt upon a statement of Macaulay's. After mentioning that the Vice-Chancellor was punished by being deprived of his office, he adds in a note:—

Macaulay, vol. ii., p. 280, says he was also deprived of his mastership, but Burnet says expressly that he was not: "All that was thought fit to be done against him was to turn him out of his office. That was but an annual office, and of no profit."

What Macaulay really does say is that Dr. Peachell was sus-

pended from all the emoluments to which he was entitled as Master of a college. If Professor Yonge had taken the obvious course of referring to the authority cited by Macaulay, the *State Trials*, he would have read in the sentence, as given under the seal of the Commissioners for Ecclesiastical Causes by whom Dr. Peachell was tried—"That the said Dr. John Peachell shall, for the said disobedience and contempts, be deprived from being Vice-Chancellor of the said University. . . . And also, that he be suspended 'ab Officio et Beneficio' of his Mastership of the said College, during his Majesty's pleasure." In his mistake between deprivation and suspension Professor Yonge may find comfort in the illustrious example of the Lord Chancellor Jeffreys, who made precisely the same mistake in delivering the sentence. As for Burnet's inadequate account, it was supplemented long ago by Onslow in his note on this passage.

The Professor casts a similar doubt upon a statement of Hallam's, on no better grounds than his own careless reading of Burnet and Clarendon. At page 143 we read:—

Hallam (chap. iii. p. 125) says that to the old members of the Parliaments of Charles II. were added 50 members of the Common Council, with the Lord Mayor. But he gives no authority for this statement, which is not corroborated by either Burnet's History or Clarendon's Diary.

Now let us see what Burnet and Clarendon really do say on the matter. Burnet's account is:—"He [the Prince of Orange] called all the peers, and the members of the three last Parliaments, that were in town, together with some of the citizens of London." Clarendon writes on the 25th December:—"The Prince's answer was to this effect:—'That he could not give an answer to these Addresses till he had spoken with the gentlemen who had been formerly of the House of Commons, and whom he had appointed to be with him to-morrow, as likewise the Lord Mayor, Aldermen, and Common Council.'" To our understanding these accounts, as far as they go, are strong support of Hallam. But, in fact, Hallam does give his authority—"Parl. Hist. v. 26"—on referring to which we find the summons of the Prince of Orange, desiring the presence of the members of King Charles's Parliaments, the Lord Mayor and Court of Aldermen of the City of London, and fifty of the Common Council. It is there further stated that, with the exception of the Lord Mayor, the City men came as requested, and joined with the old members of Parliament in the Address to the Prince of Orange which preceded the calling of the Convention of 1683-9. Before correcting great historians like Hallam and Macaulay, it is advisable to refer to the sources whence they derived their information. We must add, however, that on a point relating to the Bill of Rights our author makes out a good case for Burnet against Macaulay, who on very weak grounds accuses the Bishop of gross inaccuracy. It is curious, considering the attention which Professor Yonge seems to have given to Burnet, Hallam, and Macaulay, that he should sometimes go wrong on matters which one would have thought he could not have failed to learn from them. In recapitulating the substance of the Declaration of Right, he says:—"It enumerated those fundamental principles of the Constitution, as laid down in the ancient charters, that no King could dispense with the established laws without the consent of Parliament." Here he misses the loop-hole left for the dispensing power by the limitation of the Declaration against it, "as it hath been assumed and exercised of late." This is a nice point, but it is clearly brought out both by Hallam and Macaulay, and should not have been overlooked in a book dealing with the constitutional aspect of the Revolution. The most serious mistake, however, that we have come across is in the account of the recoinage of 1696, and the financial measures then taken by Montague:—

The hearth tax was one of the oldest sources of the national revenue; but it was bitterly and universally hated, as one which pressed unduly on the poor, and which gave the collectors pretexts for domiciliary visits, which were almost always annoying, and not unfrequently were the means of unfair extortion. Montague now proposed to abolish the hearth-tax, and to substitute for it a window-tax, and the House of Commons unanimously approved of his design.

Has Professor Yonge never read the Stat. 1 W. & M. cap. 10, "for the taking away the Revenue arising by Hearth-money"? Has he forgotten how his Majesty, "having been informed that the Revenue of Hearth-money was grievous to the People," was pleased to signify his pleasure "either to agree to a Regulation of it, or to the taking it wholly away," and how the Commons did find that the said Revenue "is in itself, not only a great Oppression to the poorer Sort, but a Badge of Slavery upon the whole People, exposing every Man's House to be entered into and searched at Pleasure, by Persons unknown to him"? If Professor Yonge's studies have not extended to the Statute-book, he has read Macaulay and Burnet, and from them might have learned how William along his whole line of march, from Torbay to London, had been importuned "to discharge the chimney money"—a grievance which doubtless pressed sorely upon many who had never known or resented those invasions of our rights and liberties which cost James his throne—and how effectually the new King bestirred himself in the matter. Such is fame, and so soon are benefits forgotten. "By which"—to wit, the taking away of hearth-money—"your Majesty," say the grateful Commons, "will erect a lasting Monument of your Goodness in every House in the Kingdom"; but seemingly no such monument has been erected in Professor Yonge's house, or, if there be one, the date inscribed is about seven years too late, and Montague's name has usurped the place where that of the Deliverer should be. What Montague really did was not to propose to abolish the hearth-money, but to devise the window-tax to supply the

place of the abandoned impost, which, in Macaulay's words, "odious as it was to the great majority of those who paid it, was remembered with regret at the Treasury and in the City."

As a whole, the book wants life, and the subject is not one which can bear tame treatment. Macaulay made a Whig epic of it, with King William for the central figure; a writer of equal skill on the other side might make it a tragedy of the fortunes of the Stuarts. To the student of the Constitution it is the happy winding up of a long chapter of constitutional struggles; to the student of character there is a vein of tragi-comedy in that triumph of religion and liberty in which none of the chief actors, except the foreign prince whom we called in to save our national rights, played a hero's part. But, without some genius in the teller of the tale, it is apt to be a rather dreary and spiritless one; and Professor Yonge does not display sufficient historical insight or minute accuracy to atone for its want of interest as a story.

THE LENOIR COLLECTION.*

WHEN the blind fury of the French Revolution destroyed the tombs of the kings in the Abbey Church of St. Denis there were probably many persons standing by, or even assisting, who secretly regretted the destruction, and who would willingly, if they had dared, have opposed the more senseless and destructive of the iconoclasts. The *procès-verbal* which details the progressive steps of the disgusting work dwells on the horrors of the scene with simple minuteness; even pausing to remark that it was at eleven o'clock in the morning, at the moment at which the head of Marie Antoinette was cut off, that the body of Louis XV. was taken up. An account of its state of putrefaction follows, with the remark that the odour was insupportable, and that powder was burnt and guns were fired to clear the air while the body was thrown quickly into the pit upon a bed of quicklime and covered up at once. Notwithstanding this horror and haste, an artist was present making notes, and it is to the same man, whom neither sickening smells nor the fury of the mob could put off his balance, that France owes the preservation and ultimate restoration of so many of these monuments. It is indicative of the calmness of his temperament that while even the cold writer of the *procès-verbal* is disturbed and hurried by the shocking nature of the work, M. Lenoir is able to observe that the King's head was white, the nose violet, and the back of the body red, like that of a new-born infant. But his coolness in the presence of danger did not desert him when he had made his notes. He could do nothing while the madness lasted to arrest the execution of the decree of the Convention. He knew that Barrère's proposal would be carried out before any feeling of regret or remorse could exist to be urged to account. The strong arm of the Republic, to use the bombastic language of the demagogue, must efface without pity those proud epitaphs, and demolish the mausoleums which recalled the frightful memory of the kings. But when it was all over, and people began to come to their senses, Lenoir obtained leave to make a collection of the best works of art which had been among the royal tombs. The convent of the Petits Augustins on the south side of the Seine, opposite the Louvre, was assigned to him for the purpose, and he gradually assembled in it not only the chief statues and carvings from St. Denis, but many from other places which during the outbreak had also been desecrated. He labelled every example, not always rightly, it may be supposed, and arranged them as far as possible chronologically. Under what head he classed the body of the great Turenne, which was exhibited in a case, we are not informed. Although the mob did not allow it to rest in the crypt of St. Denis among the kings, neither did they fling it into the ditch, but, probably with some idea of paying it a kind of respect, they brought it to Paris, and now after its travels it rests, for the time at least, beside the tomb of Napoleon at the Invalides.

When more settled times came, M. Lenoir was formally appointed president of the museum which he had opened in 1794, and the monuments remained under his charge until 1816, when in December an ordinance was issued establishing the School of Art, and assigning the Petits Augustins for its head-quarters. The decree further prescribed the restoration of the monuments brought from St. Denis, and the return of the others which had been assembled from various places to the churches or the families to which they had belonged. In many cases—as, for example, in those of the Montmorency family and those of the diocese of Paris—the rightful owners were indifferent to their preservation; and several statues, now at Versailles or in the Louvre, were long in the gallery of M. Lenoir with those which were returned to St. Denis. But when his museum was broken up and his occupation gone, he could not part from the relics he had so long guarded; indeed it is more than probable that, but for his knowledge, it would have been found impossible to replace them; and so, as if by a kind of right, he became Curator of the Royal Monuments of St. Denis, and superintended the second exhumation of the bodies which he had seen so roughly treated in 1793. How far he was able to identify the remains we cannot say. It is more than likely that many mistakes were made, and that different memories yielded conflicting impressions. Though no lowly woodman usurps, where all were royal, or at least noble, a king's grave, yet it must have been

as impossible to distinguish the bones of one prince from another as to tell the corpse of Marmion from that of his follower at Flodden. In all the work, both conjectural and scientific, M. Lenoir took a prominent part, and yet he found time for various books on the history of art, and on hieroglyphics, which he also studied. In 1838 he died, much regretted, and, it is to be feared, in reduced circumstances.

The unrivalled knowledge of portraiture possessed by M. Lenoir, and the numerous opportunities which the troubled times in which he lived afforded him for making a collection, were not wasted. Two years before his death he parted with his gallery of portraits. They were first offered to the Government of Louis Philippe; but though, as Lord Ronald Gower tells us, the price was much below their value, it was cavilled at, and a London agent brought them to this country; so "France (owing to the shabbiness of the Citizen King's Government) lost what is probably one of the most genuine and interesting collections of historical French portraits either in this country or in France." It passed into the possession of the Duke of Sutherland, and is hung in the private apartments of Stafford House. Lord Ronald Gower, with a consideration for the public which is worthy of all praise, has endeavoured in the present volume to make it known by a catalogue of a very pleasing kind, where every item in the list is accompanied with a drawing more or less elaborate, so that the portrait or the person portrayed may hereafter be identified. How far Mr. Scharf would agree with him as to the names attached to some of these pictures we cannot say. In all probability several of them are erroneously described, but a first step has been made in this publication towards rectifying such mistakes, and if similar catalogues could be obtained of similar collections in other places, we might easily pardon all faults and errors of description for the sake of obtaining some method of identifying the faces and forms which appear on so many walls. There are few subjects in the whole range of the literature of art more interesting, few more difficult, and none upon which less has been written of an available kind. Illuminated manuscripts contain innumerable portraits, portraits painted in many instances long before the dawn of painting as we now understand the word. We commonly reckon the Westminster picture of Richard II. as our earliest English portrait, but if we look into manuscripts we may go back from the fourteenth century to the tenth. In his memoir on the Westminster painting, contributed seven years ago to the *Fine Arts Quarterly*, Mr. Scharf carried his investigation of the authenticity and authority of the work into books as well as among galleries. A list of portraits in manuscripts compiled by such a painstaking and accurate hand would be of inestimable value. Dunstan's picture of himself in one of his books at the Bodleian might perhaps head the list, but a long array of knights and ladies, of kings and prelates, might be gathered from various quarters, including the Louvre, the Bedford Missal, and a countless host of similar volumes in each of which the portrait of a patron was included. Among the foremost of these patrons of art must always be counted the Duke of Burgundy and his wife, the sister of Edward IV. of England, and portraits of the Burgundian family most frequently occur in collections. Their number must be very great, and, as we naturally expect, the two earliest pictures in the Lenoir Collection bear the names of members of the family. The first is on panel in oil, and is named "Jean (Sans Peur) Duc de Bourgogne," which accords with an inscription on the back. If this is really a portrait of Duke John, who was the contemporary of Richard II., it is an extremely early and curious example. Because it is in oil, and for other reasons, we cannot but hesitate to accept it as genuine, or at least to accept the description as correct. There will be less reason to doubt the authenticity of the second picture. It almost certainly represents the famous Bastard of Burgundy, and in the opinion of Lord Ronald Gower it is probably by Van Eyck. It did not originally belong to the Lenoir Collection, but was added to it by the Duchess Countess of Sutherland, and is well worthy to be counted with the rest.

We cannot go minutely through every item of interest in a collection which contains upwards of one hundred and fifty likenesses. There are a large number either by Clouet or attributed to him. Of these twenty-one are in chalk and fifteen in oil. Among the former is one designated as "Renée de France, Duchesse de Ferrare," who was the mother of Tasso's Leonora. Clouet's works in the collection include also drawings or pictures of Margaret Tudor, Henry II., Diana of Poitiers, Catherine de' Medici, and in fact all the French celebrities of that day. A very remarkable drawing bears the name of Du Moustier, but, as Lord Ronald Gower points out, it cannot be by him, as it represents the three Coligny brothers, and Du Moustier was not born at the time of the Massacre of St. Bartholomew. With respect to this drawing Lord Ronald says:—

Although the picture at Knole is not altogether the same in composition as this drawing, there is a strong resemblance between them, and Clouet is well known to have been, like Holbein, in the habit of making a careful chalk study of the subject of his portrait before painting it in oils—an instance of which occurs in the two portraits in this collection of Marguerite de Valois, one being in red and black chalk, and evidently a study for the same portrait painted in oils, the only difference being that in the one she wears rings and not in the other.

There are also separate oil pictures of the Admiral and his brother the Cardinal. After Clouet, Du Moustier is best represented, there being no fewer than twenty-one drawings in crayon as well as an oil-painting of the Duke of Guise. Three other pictures deserve separate notice among those of the earlier school. It is

* The Lenoir Collection of Original French Portraits at Stafford House. Autolithographed by Lord Ronald Gower M.P. Maclure and Macdonald. 1874.

much to be wished that their authenticity could be proved. One of them is a most unusual portrait of Calvin, who is represented in an oil-painting attributed to Holbein, with a round face and full lips, so much more like what we are accustomed to expect in likenesses of Luther than in one of the French prints it is actually so named. The inscription on the background is certainly later than the picture itself, and consists of the words "Calvinus etatis 44, 1538." A still more remarkable work is thus described:—"This is perhaps the most interesting portrait in the collection, being the work of Cinq Mars' friend, Louis XIII. M. Lenoir, although he makes no special allusion to this drawing, puts it down in his written list as "Cinq Mars dessiné par Louis xiii, and it has never been disputed." The drawing is very slight, in black and red chalk. The King was no mean artist, and this face, as rendered by Lord Ronald Gower, is full of expression. But one of the most striking portraits in the book is a profile, in oils on canvas, said to represent Mary Queen of Scots. It is much to be wished we could obtain some account of the previous history of this picture, which has been removed to Dunrobin Castle. The Queen is in a scarlet dress braided with gold lace; her hair, in which there is a white feather, is coloured auburn, and her eyes are brown. The resemblance to the effigy in Henry VII.'s chapel is very striking, and this is perhaps so far the only argument for the genuineness of the portrait.

Among the later pictures is one of Watteau by himself, with these lines written underneath:—

Watteau par la Nature orné d'heureux talens
Put très reconnaissant des dons qu'il reçut d'elle;
Jamais une autre main ne la peignoit plus belle,
Et ne la put montrer sous des traits si galans.

In his note on the portrait of La Chapelle the comedian we are reminded by Lord Ronald Gower of the following anecdotes:—

He is said to have been curiously eloquent in his cups, and he used to discourse philosophy with the servants. On one occasion a friend found him surrounded by waiters all in tears, and on being asked the reason, Chapelle said, "Nous pleurons la mort de ce pauvre l'indare, que les médecins ont tué." He then recommenced this narration of a tragic event which had occurred two thousand years before in such a manner that they all recommenced crying. On a similar occasion, after a supper at Auteuil, Chapelle and his comrades having become rather maudlin on the vanity of mundane affairs, resolved to put an end to their miseries by drowning themselves in the adjacent river, and were only prevented carrying out their intention by Molière, who, having supped on milk, was in a less gloomy state.

ROMANIA.*

TEN quarterly numbers have been published of the excellent periodical now before us, but we doubt whether it is by any means as familiar as it ought to be to English readers. A brief notice of some of its principal articles may perhaps do good service in rendering its merits more readily recognizable. To special students of the Romance languages it is doubtless well known, but there are probably many explorers of a less restricted field of knowledge who will be glad to have their attention called to so rich a store of information. For its contents are of a varied nature, though all bear upon the subject to which the review is devoted, "the study of the Ruman languages and literatures." To that study special aid has for some time been afforded by several journals, the oldest and the most important of which is the well-known *Jahrbuch für romanische und englische Literatur*, founded in 1859 by A. Ebert and Ferdinand Wolf, originally issued at Berlin, but now at Leipzig. At Bologna the *Propagatore*, edited by Zambini, has done good service for some seven years to the Italian branch of the study; and at Montpellier, since 1869, the *Revue des langues romanes*, the organ of the *Société pour l'étude des langues romanes*, has paid special attention to the *langue d'oc*. In January 1872 the review now before us began to appear, edited by two scholars whose names are a guarantee for sound work, MM. Paul Meyer and Gaston Paris.

In the first article of the first number M. Gaston Paris, a worthy associate in the work so excellently carried on by his father, M. Paulin Paris, discusses at length the meaning of the name given to the periodical. It may be briefly summarized as follows. The designation *Romani* was originally restricted to persons who were actually born at Rome, or on whom it was conferred by special favour. But the restriction was gradually ignored, especially after the celebrated edict of Caracalla had made all the inhabitants of the Empire Roman citizens. When the Empire was menaced by the Barbarians, the word *Romani* became generally employed to distinguish those inhabitants from the myriads of foreigners by whom the borders were beset. After a time the strangers gained the upper hand, but they were still called *barbari*, and they even tranquilly accepted the designation, just as the Romans themselves had accepted the name of βαρβαροι inflicted upon them by the Greeks. Nor were their feelings ruffled when they were so styled by the Romans whom they employed to write their Latin laws. All the Germans were so designated, the word *barbarus* meaning no more than "stranger to Roman civilization" or "alien to Christianity," and having to some extent the force of *gentilis*. At that time, according to Waitz (if not to Grimm), the German tribes had no name by which to express their collective nationality. The word *Germani* would have sounded strange to them. As to *theodisc*, *diutisc* (Fr. *tiedois*, Ital.

tedesco), it appeared in the Latin form *theotiscus*, *theudiscus*, only in the ninth century; the earliest trustworthy example of its use, thinks M. Gaston Paris, occurring in the text of the Council of Tours, A.D. 813, in which mention is made of the *lingua theotisca*. The word *theodiscus*, it is true, is cited by Du Cange from Servius (on *Æn.* IX.), but it does not occur in the oldest MSS., and in others it varies, sometimes appearing as *teutonica* or *thusca*. The adjective *theodiscus* properly signified "national" (in Ulfilas *theudiskô* = *gentiliter*), and was long applied to the language only; gradually the speakers of the *diutisca zunga* began to call themselves *Diutiskien*, whence the present *Deutsch*. The name Teuto appears nowhere, and the derivative *teutonius* employed by certain Latin writers was a classical souvenir which reposed on no real denomination. At all events, at the time of the Teutonic invasions, the *Romani* was the Latin-speaking inhabitant of any part of the Empire. He called himself by this name, not without some touch of pride. But his conquerors did not use the appellation. The word does not seem to have penetrated into any of their dialects. The name they gave him was *walah*, later *welch*, A.-S. *wealh*, O. N. *vali* (modern Swedish *val*), to which are attached the derivatives *walahisc*, later *welchsc*, &c. In French the word *welche* conveys a shade of contempt, such as it probably conveyed to the minds of the Teutons who pronounced it. The conquerors naturally thought themselves better than the conquered, and even some Latin texts have preserved the memory of the sentiments which the dominant race, many centuries after the fall of the Empire, entertained towards the *Walahen*, sole depositaries as the latter were of Western civilization. Take, for instance, the phrase, doubtless due to a Bavarian of Pepin's time, in the Roman-German Glossary of Cassel:—"Stulti sunt Romani, sapienti Paicari; modica sapientia est in Romanis; plus habent stultitia quam sapientia." Here, by a lucky chance, says M. Paris, we possess, by the side of the Latin translation, the thought of this excellent *Peigir* in the very form in which it dawned upon his mind:—"Tote sint Walha, spæhe sint Peigira; luzie ist spæhi in Walhum; mæra hapont tolaheiti denne spæhi." The name *Romani*, however, did not maintain itself beyond the Carlovingian times. The fusion of the conquerors with the conquered, and the adoption by the former of the tongue of the latter, in Italy, Spain, and part of France, displaced the general appellation, which was replaced by the special names of the several nationalities formed after the dissolution of the Empire of Charles the Great. It survived, however, in two well-known instances, in which the people kept up the ancient appellation to distinguish themselves from the *barbari*, by whom they were surrounded; and, faithful on their side to early tradition, the Germans called them *Walahen*, a name which has, slightly modified, adhered to them to this day. Each case occurred where a Roman population was living in a sort of island amid other races. The people who call themselves, as well as their idiom, *Romanisch*, are known to Germans by a name derived from *Walah*, i.e. *Walschen*, *Churwaldschen*. Those inhabitants of the Danubian provinces who speak a Latin dialect call themselves *Romans* (Humen, &c.); but the name of *Wallachians* is given to them only by the surrounding strangers. Ask a Wallachian, says M. Paris, "Que es?" and he replies "Io sunn Romani." Like the *Romani* of the West, those of the East received from the Germans the name of *Walahen*. The Greeks afterwards accepted it under the form of βλάχαι, and from them it seems to have been passed on, with slight modifications, to the Slavs. According to M. Diez, the Walloons have acted differently from the *Romanisch* of Coire and the *Romanians* of Wallachia, having accepted as their designation the name (in their case slightly altered) which the "Barbarians" gave to them. On our own Welshmen, it may be observed, M. Paris does not dwell at any length; nor does he enter into the vexed question as to the connexion of the name *welsh* or *walah* with the Sanskrit *malétha*, &c.

From the name *Romanus* came *Romania*, formed by analogy with *Gallia*, *Britannia*, &c., its appearance marking the moment when the fusion was complete among the peoples subjugated by Rome. When the capital was shifted to Byzantium the Empire still remained Roman, Latin being the official language—so much so that in A.D. 462 a magistrate was punished for having employed Greek instead of Latin in public acts in Egypt. Greek writers employed the word *ρωμανία* to express the whole Empire, and from Greek the name came back into Latin with the accent transferred to the penultimate. Thus in a poem on a Pisan victory in 1088 it is said of a Saracen pirate that he

Captivabat omnes gentes que tenebant Hispaniam;
Et in tota ripa maris torbatat Italian;
Predabatur Romaniam usque Alexandriam.

In the West the term *Romania* was for some time employed to express the Roman Empire as opposed to the Barbarians, or, the totality of Roman civilization. After the time of Charles the Great its use seems to have been restricted to Italy, and eventually it was applied only to the province which still bears the name, and which answers to the old exarchate of Ravenna. MM. Paul Meyer and Gaston Paris now wish to restore it to its ancient and wide signification. It was not perhaps without some reference to a successful and united *Germania* that they selected as the title of their journal "un mot bien choisi, pour dire le domaine des langues et des littératures romanes." Not that they dream of a union of the Roman nations based upon a community of race. When the Latin races are spoken of, remarks M. Paris, it should be remembered that there are no Latin races. The civilization and language of Rome have been adopted by peoples widely differing in race—Kelts, Ligurians, Iberians, &c. A union of the peoples whom

* *Romania: Recueil trimestriel consacré à l'étude des langues et des littératures romanes.* Publié par Paul Meyer et Gaston Paris. Nos. 1-10. Paris: Librairie A. Franck. 1872-74.

collectively the name *Romania* describes must be one, not of physical, but of mental kinship.

But we must not tarry longer over M. Gaston Paris's excellent article, even for the purpose of inquiring whether there are not in it some statements to which German philologists may take exception, or we shall not have space enough for the briefest reference to the numerous notable essays of which *Romania* can boast. Among these may be specially mentioned the article by M. Paulin Paris on the origin and development of the story of the Holy Grail; a study in Italian, by P. Rajna, on "Ugari il Danese nella letteratura romanzesca degli Italiani"; M. Auguste Longnon's "P. Villon et ses légataires," a careful investigation of the documents relating to the life and writings of that old French poet; and Signor Alessandro d'Ancona's elaborate and exhaustive study, in Italian, of "Le fonti del Novellino." The last of these may be strongly recommended to comparers of popular tales, the copiousness of its references rendering it a worthy companion to the invaluable studies of a similar kind for which "etorologists" are so deeply indebted to Professor Felix Liebrecht and Dr. Reinhold Köhler. The attention of philologists may be specially called to such articles as F. A. Coelho's "Formes divergentes de mots portugais"; H. Schuchardt's "Modifications de la consonne initiale dans les dialectes de la Sardaigne, du centre, et du sud de l'Italie"; E. Rolland's "Vocabulaire du patois de Reuilly (Moselle)"; O. Joret's "Loi des finales en espagnol," and many other articles of equal value.

In addition to, or in combination with, critical essays, are given numerous original texts, published for the first time. M. Paul Meyer, for instance, contributes to the first number an Anglo-Norman *fabliau* entitled "Le Chevalier, la Dame, et le Clerc," published for the first time after a MS. in the library of Corpus Christi Coll., Cambridge; and to the fourth the text of a verse translation of the *Bertrams*—made by a certain Gervaise, of whom little is known except that he was a Norman, and was unable to walk without the aid of a stick—as well as five pieces grouped under the title of "Mélanges de littérature provençale." The third number contains a variety of "Documents inédits en patois lorrain du XIV^e siècle," edited by M. Fr. Bonnardot; the fifth, "La destruction de Rome, première branche de la chanson de geste de Pierabras," published from a MS. in the Municipal Library of Hanover, by M. G. Grober; and the sixth, the romance of "Blandin de Cornouailles," edited by M. Paul Meyer after the only known MS. of the poem, which is preserved in the Royal Library of Turin.

The titles which we have cited will be sufficient to prove the richness of the contents of *Romania*, but before taking leave of it we may mention one or two articles which may perhaps prove of more general interest than some of the others. Of such a nature are the collections of popular songs which appear from time to time in its columns. Thus the tenth Part contains a number of "Romances sacros, orações e ensaios populares do Minho," annotated by F. A. Coelho; the ninth, a collection of "Chants populaires recueillis dans la Vallée d'Ossan," by M. Th. de Puymaigre; and to the third, fifth, and eighth M. Victor Smith contributes a copious store of "Chants de quêtes" and "Chants de Pauvres" from the districts of Forez and Velay. M. de Puymaigre found some difficulty at first in discovering any genuine popular songs in Bearn, the greater part of the verses sung there by the people being the compositions of the local poet Despourrins. No true poet of the people, he observes, would have compared his mistress's nose to the gnomon of a sundial:—

Son nasillon dessus sa care,
Yogue dab lous arais dell sou,
Et de l'ombrette qu'in débare
Marque las ores de l'anoun.

But after a time he found a mountain guide and a lame one-eyed peasant, who sang to him the kind of songs he wanted to hear, many of them relating to Gaston Phœbus and Henri Quatre, who, as well as in a minor degree Bernadotte, are the legendary personages of the country. The songs collected by M. Victor Smith belong to a less dignified, but equally interesting, class, being those with which the month of May is greeted by the rustic minstrels, little children, or youthful damsels, who sing from door to door, or the antique *Complaintes* which, although fast dying out, still form the stock in trade of old-fashioned beggars in out-of-the-way corners of France.

BY STILL WATERS.*

MR. GARRETT'S stories do not improve. He gains in experience each time he is criticized, and, becoming cautious, grows dull. He writes, it is clear, with his Johnson's Dictionary at his elbow, and, like a careful recruiting-sergeant for the Guards, he no longer admits into his lines a word merely because it is very long. The time was when the first four-syllable word that, as he wrote, came into his head, at the same time came also into his book. It is now, as it is easy to see, put through some kind of inspection. His converted sinners and his saints who needed no conversion have fallen off almost as much as his language. We have no sweep who, growing penitent, oils his hair every Sunday and modestly seats himself on the back bench of a chapel. We have no saint whose highest indulgence goes not beyond a visit to the Zoological Gardens, with wholesome refreshment of ginger-beer and buns.

* By *Still Waters, a Story for Quiet Hours.* By Edward Garrett, Author of "Crooked Places," &c. London: Henry S. King & Co. 1874.

There never was in his stories anything to interest us, and how there is not much left to laugh at. He despises his critics no doubt. He must learn to neglect them at the same time. It is not every writer who can afford to gain common sense. An author who is at last brought to sound reason by his critics may have as much cause to hate them as the madman in Florence, when hellebore had made him sane, had to hate his friends. A lunatic, as we read the other day in the papers, recovered his senses by a fall, but the same accident that cured his head lost him the use of his legs. So, too, a writer might by the falls he receives from his critics find he had regained his reason, but lost his readers.

Though Mr. Garrett has mostly given up the use of very big words with no particular meaning attached to them, yet he still keeps to his old metaphorical style of writing. His metaphors, like those of tracts and sermons, have all the merit that arises from confusion, and they strike the reader's imagination with all the more force the less they are understood. If we cannot expect to edify, we may at least hope to amuse, our readers by gathering a few of them together. There are, we must allow, few things harder to manage successfully than your metaphor, and we think it would not be ill, just as there are masters of deportment who teach Aldermen how to carry a sword without getting tripped up, if there were also masters of composition who would teach parsons and writers of good books how to use a metaphor so dexterously that it would not lead them into uttering nonsense. Metaphorical nonsense, however, like big words, has its market value, and those who live by the sale of it would not willingly lose the art by which they produce it. In the second page of his book Mr. Garrett refreshes himself, after a dry and matter-of-fact introduction which had filled no less than fourteen lines, by at once plunging into a metaphor. Writing of his heroine, Sarah Russell, he says:—"When the realities of love are taken from hearts and lives, she felt that, instead of stuffing them with shams of unsatisfying husks, it is better to keep the empty chambers open till other real things come creeping in." It is not an empty chamber that is suggested to us by the unsatisfying husks, unless indeed "chamber" be used in a somewhat loose sense. Therefore, however much pleased we may have been with the metaphor as it began its course, yet at the end we could not but receive a shock when we thought of real things coming creeping in where husks had neither filled nor satisfied. So fond is this good lady of her metaphor, that on the strength of one she goes the length of engaging us her servant one of those women in whom there is a feeble, peevish poverty of nature—a dry living in the cold, outside their own hearts, which they have shut up, that nobody shall see the utter desolation therein." Such a woman as this we can readily believe Sarah Russell "would not have chosen. This was not the fulfilment of the idea that had floated in her mind." But then "she remembered that, when she was a child, putting up puzzles, she had noticed that the right piece to fit in often looked the least likely until it was fairly placed, and the surrounding places arranged. It would do no harm to hold this piece of life's puzzle in hand awhile—and wait." At the same place where Sarah Russell had engaged the woman because she did not seem likely to suit her, was a young man who was to play a chief part in the story. Sarah had never spoken to him, yet the "old maid said to herself, that he might have been her son, her own son—who would never be—at least in this world." She clung nevertheless to the thought that somewhere else the barren woman shall be a joyful mother of children. For as "God's truth, like sunlight, stretches far and wide, and high beyond the words, narrow at best, through which it can but dimly enter these flesh-clad souls of ours," so she was one of those who "let in its glory wherever it can find an entrance; through wide-set gate of highest faith, or glowing casement of creed, or tiny chink whence some human hope escaped us."

Her faith was not in vain, for in the end, meeting the youth again by chance in London, she found out that he was the orphan son of the faithless, but since penitent, lover of her girlhood, and thus she could look upon him as almost her own child. This of course was at the end of the story. We are at present dealing with the time when every one in the book except Sarah still belonged to those "who miss the gems that lurk in the dark waters of deep experience, and who miss the glimpses gained from Pisgah heights of mental triumph." She alone as yet could see how "the little differences in our developments of faith and grasps of law dwindle as do the differing mountains of the earth as it hangs in boundless ether." She came up to London, and with her newservant took rooms in an old hotel in an old square in the heart of the City. So satisfied was she with her quarters, that "she thought to herself that she had come at last into the place of 'Still Waters.'" Let not the reader too hastily suppose that that was the sign of the hotel. No. It was at the "Robin Hood" that she was staying. Yet she did not allow herself to be deceived. She was in her hotel, but "the storms were still going on somewhere. She was not likely to forget that, for over the lake of her life, when most hushed, there would still come a ripple blown by a tempest raging afar off. And in her days of sunniest experience she would always catch herself listening for a distant roar of thunder." Her peaceful life happily was not disturbed by the unknown female whom she had engaged as servant running off with the spoons. She could read "God's recommendation in face, and voice, and circumstances," and had not to trust altogether to letters of recommendation, exposed as they are to one "possible danger when we let them grow into fetters—becoming paralysed in our little go-carts." Unparalysed as she was in her little go-cart, and free from those fetters which

grow out of letters of recommendation, it is no wonder that Sarah Russell had "a wonderful resemblance to the ways of stately chateaux of old régimes." It is not reasonable in so admirable a character to expect universal knowledge. Nevertheless we cannot but regret that, if Sarah was strong in her metaphors, she was weak in her derivations. "*Parlour*," she said, "might be taken as derived from the Latin *par*, 'like,' or 'equal,' or, nearer still, from the French *parler*, to speak, which she suspected was really a branch from the same root." A cousin of Sarah's, by the way, the active-minded Tibbie, has also mastered a hard word or two. "I am *hétérois* by nature," she asserts, and as she asserts it, she, or the author, as the reader will notice, considerably marks the quantities. After such a display of classical learning we almost wonder that Mr. Garrett makes the plural of *Dives*, *Diveses*.

But we are wandering from our metaphors, and it is to our metaphors that we intend chiefly to confine our attention. Perhaps we can find no happier instance of Mr. Garrett's peculiar powers than in the following passage:—

"As for Christmas-boxes, I shall give some—I know people get their wages, but wages have to be regulated by all sorts of principles of political economy. They are the wheels, as it were, of life, and they go all the easier for a little oil. Human life defined by a line, is as uncomfortable as would be the human figure defined by a wire. One prefers a little mist about it, where Hope may put out a wondering hand. One likes life weighed out with something to turn the scale. Perhaps I look for so much for myself in God's 'more abundantly,' that I like to make little earthly types of it when I can."

What, by the way, are the wheels of life? Is it the wages or the principles of political economy that are meant? If, as we are inclined to guess, it is the principles, then it would seem that Christmas-boxes are a kind of oil which when applied to those principles that regulate wages makes them go all the easier. It is somewhat hard, to use one of Mr. Garrett's phrases, to inject oneself into such thoughts as these. Perhaps, if they cannot be grasped by reason, they might at least be seized by what he calls in another passage "ignorant but intuitive psychometry." Sarah Russell happily does not often rise to such a height as the oil that is applied to principles. She generally uses only "a little talk about ordinary things," when "we find out the friendly heart to which we may confide our secret, and which will cover it and keep it, like an egg laid in the warm wool of a nest." How ordinary, for instance, is such a metaphor as the following:—"We know there is a dust-heap in the back-yard, but we don't mention it at dinner-time, nor turn it over when we are in our best dresses. That would be simply the same as defiling any kindly plan of our own or another's by splashing it over with a foul opinion." Whenever Mr. Garrett is tempted to stray back into his big words of old, and writes of "the primal elements," "rudimentary chaos," "every nimbus of spiritual yearning or aspiration," "the auricular organs of one's auditors," such simple metaphors as these, drawn as they are from the back-yard and the dust-heap, come, to use once more his own words, "like glints of sunshine over a gutter." But Mr. Garrett will accuse us of "pursuing the botany of 'waste and ruin' among fruit blossoms." If we in our dulness do not like the metaphorical style of writing, that, he will say, is no justification for "the botany of waste and ruin" whenever we chance to come across flowers of rhetoric. He would say of us that "We are in the loft behind the organ, where the bellows are creaking among dust and pulleys." But then he might go on reproachfully to ask us, in the words of his heroine, "When you have listened for a moment at one chink, don't you catch an idea of the harmony that is going on at the other side?" We are among the unconverted and the unoled. We have no relish for ginger-beer or penny buns, and, in the deafness of our auricular organs, when we listen at the chink of Mr. Garrett's story to the notes which the serious world is grinding away on the barrel-organ of tracts, it is anything but an idea that we catch.

SOMERSET ARCHÆOLOGICAL PROCEEDINGS, 1873.*

WE have here the annual volume of one of the most active of the local antiquarian Societies, and one which does not confine itself to antiquarian objects, but takes in the geology, botany, and zoology of the district as well. The book consists chiefly of the record of the meeting held at Wells last year. The Somerset Society has the special good luck of drawing fellow-workers together from various parts of England, of which the present volume is a happy example. Mr. Clark was at the Wells meeting, but unluckily a Wells meeting furnished but little food in his special line. The little city, so purely episcopal in its history, never possessed a castle; the palace is a moated and crenellated house; but between such a house and a genuine castle there is a wide gap. The one site of a castle within the range chalked out for the excursions, that of Harptree, which played its part in the wars of Stephen, has such small traces left, and stands in so inaccessible a spot, as to be quite out of the reach of any large gathering. On each side of the Wells meeting, Taunton and Sherborne supplied Mr. Clark with ample materials, but the Wells year itself was a sabbatical year for him. Nor does the present volume contain any special contribution from Mr. Parker, who said what he had to say about the palace and the other domestic buildings of Wells ten years ago. And unluckily he would find less to say now than he found to say ten years ago, as the spirit of wanton mischief

which sees in the remains of antiquity simply materials for destruction is daily lessening his store of subjects. But, even without the help of Mr. Clark and Mr. Parker, the Somerset Society has again greatly profited by the help of strangers to the county. The chief object of the meeting was the thorough examination of the cathedral church under the guidance of Mr. J. T. Irvine, a record of which is given in the present volume. And Mr. George Williams, in his character of editor of the Letters of Bishop Beckington, has contributed a most appropriate appendix to his work in the form of a writing of Beckington's age of which we shall speak presently. Lastly, Dr. Beddoe gives a paper on the ethnology of the district, which is of special importance now that the question of a Basque element in Britain has again been started. All this comes from outside, but that so much in the transactions of a local body does come from outside is surely a sign that, either in the objects themselves which are treated of or in the management of the Society which undertakes their treatment, there is a special power of attraction beyond its geographical bounds. The truth is that a local Society of this kind, if its meetings and excursions are well planned, has some advantages over the larger bodies of the same kind. The objects to be studied can be seen more thoroughly and systematically than where there is the temptation to run off and visit objects at great distances. And in a body most of whose members personally know, or soon come to know, one another, there is a heartiness and an absence of stiffness and formality which in a larger gathering is hardly to be looked for.

Mr. Irvine's account of the cathedral is the result of a more minute examination than that building has ever before undergone, even at the hands of Professor Willis. Mr. Irvine's professional employment in the works which have been lately going on, added to an amount of zeal rare amongst any class of inquirers, whether amateur or professional, has given him a knowledge of every stone of the church such as no one has had since its successive builders. But unluckily the plates which are to illustrate the paper are delayed through some accident till the appearance of another volume, and the extreme minuteness of Mr. Irvine's inquiries, and the nature of the evidence by which some of his views are supported, really make his argument somewhat hard to follow, except on the spot. But it is easy to see that some of his conclusions are startling; they go a long way to upset received opinions, not only as to the history of the particular building, but, to some extent, as to the history of English architecture in general. And, though Mr. Irvine speaks with the authority of one who has examined his subject as no one ever examined it before, he will hardly be surprised if he does not find every one ready to accept some of his unexpected conclusions without a little more time for thought. The commonly received belief that Bishop Jocelin in the thirteenth century was the builder of the greater part of the fabric of the present church, Mr. Irvine throws aside altogether. He looks upon only a small part of the building as being his work, attributing to others, both earlier and later, the greater part of what has commonly been assigned to him.

On a point which has been a good deal discussed, the relative age of the west front and the nave, Mr. Irvine, in opposition to Professor Willis, rules the west front to be the earlier. There are certainly signs in the masonry which look strongly as if such were the case. On the other hand, so to believe implies that the builders of Wells Cathedral, after having made use of a more advanced and a more strictly English form of early Gothic in the west front, deliberately fell back on an earlier and foreign-looking form of the style in the greater part of the church. Mr. Irvine conceives that the west front was built up against the church of Edward the Elder, much in the same way as at Wetzlar the late front was begun some way in advance of the old one. There, as the later front never was finished, a tower of each is still standing. But it certainly is startling when Mr. Irvine asks us to believe that the present west front is as old as the days of Reginald Fitz-Jocelin, Bishop from 1174 to 1191. Mr. Irvine however has something to say on behalf of his own view, though it was hardly worth his while to make a long quotation from some of Mr. Parker's confused talk about the geography of France and other parts of Gaul. Mr. Irvine's views as to the extent of the different works which were carried on during the thirteenth century can only be tested on the spot. But though he attributes less to Jocelin than all before him have done, he does not fail to denounce the way in which that great prelate's memory has been treated:—

It was reserved for the late restoration of the chancel to "restore" off the face of the earth altogether the last fragments of the slab containing the indent of his lost brass—a memorial which even the Cromwellian age had respected.

We turn to the ethnological paper of Dr. Beddoe. It is always a great gain when two wholly different lines of argument lead two independent inquirers to the same conclusion. Here we have Dr. Beddoe, who looks at the matter chiefly from a physical point of view, confirming the views to which others have been led by more strictly historical arguments. Dr. Beddoe establishes a marked difference in the physical character of the inhabitants of different parts of Somerset which quite falls in with the belief founded on the historical argument. This is the belief that, in one part of the county, that part which the West Saxons conquered before their conversion to Christianity, the British inhabitants were for the most part slaughtered or driven out, while in the later conquests, those of the Christian English, a large British element survives. His researches however seem to point to the lingering on of older inhabitants in isolated, out-of-the-way places, which is very likely in itself, but which written history is not likely to

* *Somersetshire Archaeological and Natural History Society's Proceedings*, 1873. Vol. XIX. Taunton: May. London: Longmans & Co. 1874.

record. Dr. Beddoo's general conclusion with regard to Somersetshire ethnology is:—

The people of the eastern half of the county have, on the whole, broader heads, lighter hair, and darker eyes than those of the western half. In all these respects the eastern men approach more to the ordinary English, the western to the Irish standard.

In another page he goes more into detail:—

Thus I may say that the fair and handsome Frisian type is pretty common in the north of the county; that in the hilly south-eastern region about Wincanton, dark complexions and dark or even black hair attest the late and imperfect Saxonisation of the country; that the same may be said of the Quantocks; that about Minehead and Dunster, perhaps from the less fixity of population induced by sea-faring, there is more evidence of mixture of blood; and that in Exmoor and in some villages of Mendip, the narrow skull, prominent jaws, and bony frame of the Gaelic type, and the Turanian oblique eye and pyramidal skull, crop up here and there, possibly as aberrant or degraded forms, but more probably as relics of primeval races.

This is the only hint which Dr. Beddoo gives at all in a Basque direction, and it certainly stops far short of the view that the prevailing blood in a large part of Wales and western England is Basque. Dr. Beddoo goes on to make some use of his physical researches with regard to some more modern questions. He remarks that "the average Yorkshireman is really a much bigger animal than the average Somersetshireman," and yet that the Somersetshire recruits in the army "stand high above those of Yorkshire in stature and size." What is the cause of this seeming contradiction? Dr. Beddoo believes "it is connected with the redundancy of agricultural population in Somerset, and the low wage concurrent therewith." "Under such circumstances," he says, "the finer, stronger, and more enterprising men migrate or enlist, while in counties where employment is highly paid, such as Yorkshire, it is the physically inferior men who do so." He remarks that about Taunton the labouring people stand very low in respect of stature, but that "this may be due to the extreme popularity of the military service in those parts, which is such that most of the well-grown youths are speedily picked up by the recruiting sergeants, for the Marines or other corps." Dr. Beddoo, it is plain, can make the observations which come naturally to one of his profession tend to throw a good deal of light on several matters both old and new.

Lastly, there is that most curious fifteenth-century piece edited by Mr. George Williams, in which the patron saints of Bath and Wells dispute, before Daniel as their judge, about the merits of their respective cities, and which of the two is more worthy to give his title to the Bishop. The merits of hot and of cold water, of large towns and small, of people who are shut up within a city wall and people who have easy access to fresh air, are all discussed by the apostolic brethren with great vigour and vivacity, and sometimes with the use of rather hard words towards one another. Such a paper is a curious illustration of the religious feeling of the time. We should not nowadays venture to take such liberties with Apostles, nor even with "Andreas Sanctorum mitissimus." But then that may be because we do not feel ourselves on such intimate terms with Apostles as the men of the fifteenth century did. When Lucius Papirius so familiarly offered Jupiter a cup of mixed wine, it was not, as Dr. Arnold truly remarks, because he had little faith in Jupiter, but because he had a great deal. And so we may be sure that those who represented the two Apostles as disputing, in a way in which not even a comic paper would now venture to represent two living men of any mark as disputing, did not any the less believe in the value of the intercession even of the patron of the rival city. It would be curious to find out how far the notion of local protection on the part of the Saints, just as in an earlier type of belief on the part of the Gods, may have led to a partly lurking, partly playful, belief that the saint of the rival church or town was really an enemy. Yet we may believe that a Wells man of the fifteenth century did not any the less seriously reverence the Prince of the Apostles because he rejoiced to hear his own patron described as speaking to his apostolic brother in such astounding words as these:—

Nonne erubuiti honestatis ac pudicitie? Nonne, inquam, licet sis pallidus, vel paululum rubore perfusus es, cum ea te prolata plena dedecoris sint, tunc turpissima vite, tunc exulcerata mentis testimonia certissima? Tu nihil esset spurcissimus omnium quos nostra ætas tulit, nunquam protecto te in ceno villasimorum verborum tanquam immunda suis libens volutasses. At id omne recidit in illam faciem tuam impudicam.

LORD NEAVES'S GREEK ANTHOLOGY.*

NO more agreeable finish to what we trust is but a first series of interesting handbooks could have been devised than a volume which introduces English readers to the choicest blossoms of the Greek Anthology. The editor's "Lucian" must have enlightened many who knew not Lucian in the original as to one of the ancient fountains of pleasant humour and satire. But the present volume, put together by a veteran scholar who is familiar with the lucubrations of Christopher North in the field of ancient epigram, and who is himself "an old contributor to *Maga*," has a peculiar interest in itself, as well as in the antecedents and associations of its author, who is at home with all the traditions of his subject, and obviously not unfamiliar with the difficult yet attractive experiment of interpreting it to English ears. Lord Neaves can tell in his introduction of Gray's interleaved copy of Stephens's

Anthology, which bore traces of his copious annotation and translation, as well as of the more generally known fondness of Cowper and Johnson for this undeniable repertory of hints and conceits for modern poetry. And while he traces back to a French *mot* on epigrams the origin of the expression "soupe à la Grecque," he is not deterred from exhibiting enthusiasm in his task by the depreciatory estimates of such butterfly critics as Lord Chesterfield. There can be no doubt that the more familiar study of the Greek Anthology, less piquant though it be than that of Martial, or of the French wits, or even of the Italo-Latin school, might prove at the present day an excellent antidote to the prevailing sin of prolixity in poetical composition, through the standard which it affords of felicitous condensation and elegance. "Even the attempt," as Lord Neaves observes, "to imitate this character may help to purify the taste in an age when the art of concealing art seems not often practised, when condensation is not thought of, and simplicity is considered to be insipidity."

There is another point of view from which Lord Neaves's volume deserves a welcome, and that is in its recalling attention to the papers on Greek epigram translation which appeared in *Blackwood's Magazine* in 1833-34 from the pens of Professor Wilson and his coadjutors. It is a pity that these were not reprinted in the collected works of the genial "Christopher," though allowance must be made for the recent reaction in favour of classical translation, which would make such papers more generally acceptable now than they would have been then. Anyhow, we are glad to come across gleanings from them in the volume before us, as showing what a treat our fathers overlooked or made light of, when it was spread out before them in its freshness in the liveliest pages of *Maga*. Without accepting the author's undervaluation of Bland and Merivale, whose volume is still a mine of interest to the poetical scholar, we rejoice to gain, in Lord Neaves's contribution to a pioneer series of volumes on the classics, not a few opportunities of insight into the ideas as to translation of the epigrams entertained by a knot of men who were certainly more practised in poetry than their rivals, and not much beneath them in scholarship. These are afforded us, with a mixture of curious erudition, lively anecdote, and experimental emendation and correction, by the veteran "Senator of the College of Justice in Scotland," who is a link between our modern scholar-poets and those whose gossip and criticism furnished the material for the *Noctes Ambrosianæ*.

Considering the difficulty of arranging a class of compositions reaching chronologically over a thousand years, the author has probably acted wisely in dividing them into characteristic classes; and as these furnish the heads for seven chapters according as they relate to Dedicatory, Sepulchral, Amatory, Witty, or other epigrams, the volume may be taken up at odd times, and enjoyed chapter by chapter, without any loss of thread. The Dedicatory epigrams naturally take precedence, and in setting before his readers samples of these, Lord Neaves has made much, as was fitting, of Simonides, illustrating him more especially by his epigrams on Thermopylæ and the Persian struggle, and endorsing Christopher North's estimate of Bowles's neat couplet translating the most famous of these—

Go tell the Spartans, thou that passest by,
That here, obedient to their laws, we lie.

The version of the epigram of Simonides on the seer Megistias, slain in the same fight and commemorated by Herodotus, is also well-turned, and truthful in its literality. As an example of the illustrations with which Lord Neaves accompanies the epigrams which he introduces, we may note that when he cites the epitaph of Alschylus, written by the poet himself and inscribed on his monument at Gela, he draws attention to the absence of all allusion to the poet's literary achievements. All the burden of the two couplets is—

The deeds the grove of Marathon could tell,
And many a long-haired Median knows full well.

So too when Cynegirus, the poet's brother, is commemorated, we find it remarked that the epigram does not endorse the later myth of his clinging to the Persian vessel in retreat with his teeth. Only his "Wetheringtonian" prowess is alluded to in the epigram cited in p. 35, *à propos* of the Portrait by Phasis, in which the hero of the stumps was represented with both his hands:—

Blest Cynegirus, some think Phasis wrong
In giving you those hands so stout and strong;
No; he was wise those hands to let us see
By which you gained your immortality.

But the field of Dedicatory epigrams is not confined, either in this volume or in the original anthologies, to those commemorative of warlike prowess. The bride's dolls and playthings, the old fisherman's drag-net, rods, and creels, the rustic's offering of first-fruits to his patron God, suggest neat distichs and quatrains, as well as longer effusions, which are always graceful and pertinent, often arch and pointed. We have a translation in p. 43 of an eight-line epigram by Plato—whether the philosopher or another we cannot and need not know—which deserves citation for its truthfulness, and which we surmise to be one of Lord Neaves's own versions. It is supposed to accompany a votive offering to the Nymphs from a grateful traveller, and tells its own tale, which can be found in the original in No. 43 of the 6th book of the *Anthologia Palatina* as given by Tauchnitz:—

The servant of the Nymphs, who loves the showers,
The minstrel moist, who lurks in watery bowers,
A frog in bronze, a wayfarer here laid,
Whose burning thirst was quenched by welcome aid.

* *The Greek Anthology*. By Lord Neaves. "Ancient Classics for English Readers" Series. Vol. XX. Edinburgh and London: William Blackwood & Sons. 1874.

By the hoarse monitor's amphibious tone
A hidden spring was to the wanderer shown.
He followed, nor forsook the grateful sound,
Till the much-wished-for draught he grateful found.

A more modern scholar, Mr. Garnett, in his pleasant *Idyls and Epigrams*, has rendered this piece on the whole with more grace and poetic feeling; but the version of Lord Neaves has the credit of more exactness, and his rendering of τὸν λαβόντα κόψας ὑπερμένον βάρανον, as italicized above, represents a clause which Mr. Garnett seems to have overlooked or regarded as pleonastic. Whilst instituting this comparison, it occurs to us to remark that Lord Neaves, though recognizing and quoting the *Anthologia Polyglotta* published by Dr. Wellesley, does not seem to have seen or regarded some of the most promising and clever of later translations in this kind. It is odd that in his array of samples from Simonides he does not even name Mr. Sterling, who in a manner made Simonides his own by singularly happy reproductions. At any rate there are many pieces in Mr. Garnett's little volume which would have served our author's purpose when dissatisfied with Bland or Merivale, he has had to resort to the expedient of altering and adapting, which at best is somewhat unsatisfactory. One of the anonymous bath-inscriptions quoted in the "Witty and Satirical" chapter—

This bath may boast the Graces' own to be,
And for that reason it holds only three—

is, no doubt, commendably brief; but we prefer Mr. Garnett's representation of it:—

To have their limbs the Graces three
First in Arcadia fashion'd me,
Therefore I have but room for three.
For that which Grace her own doth call,
Cannot too great be or too small.

At the same time, whencesoever it may have been borrowed, one cannot too highly commend the flavour of another anonymous couplet, still *ἀπρὸς* of baths, which Lord Neaves has preserved:—

Straight from this bath went Venus, wet and dripping;
To Paris showed herself—and won the pipkin.

In the same section of Satirical epigrams Lord Neaves and Mr. Garnett ran neck and neck in their versions of one by Lucilius on the topic of those purchased locks which in the old world anticipated chignons. Here is Mr. Garnett's condensed point:—

They say that thou dost tinge (O monstrous he!)
The hair that thou so raven black dost buy.

And here Lord Neaves's quatrain:—

Chloe! those locks of raven hair!
Some people say you dye them black;
But that's a libel, I can swear,
For I know where you buy them black.

To return to the Dedicatory epigrams; on none of this class does Lord Neaves bestow pleasanter "anecdote" than upon those which represent the attraction of the softer sex to the mirror, and the love of Lais for her looking-glass. From the English novel, the French comedy, and from Southey's books, he has stories to tell of the diverse phases of this feminine weakness; and he imagines the Portuguese nuns who, as Southey tells, rushed to the looking-glass as soon as their seclusion was broken up by the French invasion, experiencing a similar pain to Lais when past her prime, and well content to hand over

This glass to Venus; since what I shall be,
I would not, what I was I cannot see.

In the chapter on Sepulchral epigrams will be found a good sprinkling of old favourites in guises more or less known, together with some which deserve to be more considered than they are. In p. 71 we have an anonymous epitaph, translated by F. Hodgson and Bland, on a useful country gentleman who in his day preferred the improvement of his own fields and gardens to the smoke of towns and the excitements of a metropolis. The couplet,

First in the spring he knew the rose to rear,
First in the autumn culled the ripening pear,

entitles him at once to rank with the Corycian sage of Virgil's *Georgics*, and suggests not only a pretty picture, but an extremely apposite parallel passage. In page 79 is an epigram of Simonides on the sister of Ippias and Hipparchus, the original of which received the praise of Aristotle. Against the version given in this volume of the epitaph of Addæus on Alexander the Great, objectionable for its pedantic use of "Macedon" for "Macedonian"—a subtlety too fine for "English readers"—

Macedon Alexander's tomb if called on to disclose,
Say that the world's two continents his monument compose—

we are inclined to pit another from Booth's collection:—

If thou would'st Alexander's tomb fitly in verse present,
—Say that two continents unite to bear his monument.

The chapter on Amatory epigrams is very suggestive both of the difficulty of reproducing the fine taste and subtle grace of the Greeks, and also of the wealth of the *Anthologia* as a mine for erotic poets. Those who rack their brains in vain to get Zeno-philæ, one of Melæger's flames, into English verse, may yet transfer the beautiful conceits of that beautiful songster into numbers which any mistress will reward by gifts that "gold could never buy." In studying the epigrams in this class which relate to the familiar commonplace of nearness to the beloved one, it is interesting to parallel Romeo's wish to be a glove on Juliet's hand, and Burns's no less poetic longing, quoted in p. 93, with an

epigram of Rufinus, of which, as Lord Neaves shows, the Merivales have omitted the last couplet. As given by the author of the volume before us, this runs—

Oh! that I were a lily fair
That, culled by fingers fairer still,
I might thy every movement share
And on thy beauty gaze my fill.

We regret that we cannot notice serially more of the contents of these pleasant chapters, but we may mention one or two salient points. The most important of these is the evident pains which the author has taken to chronicle, by epigrams *ἀπρὸς* of them, the succession of Greek sculptors and artists, and the works for which they are most famous. This is seen in the "Literary and Artistic" chapter. It is not too much to say that a careful perusal of it will enhance the interest of our national treasures in the department of gems and sculpture, and serve as a preparation for the study of Mr. King's work on *Glyptic Art*, as well as of Spence's *Polymetis*. Here we have the epigram of Antipater on Myron's "Loving Heifer," with those of anonymous authors on the Jupiter of Phidias and the Pallas of Praxiteles at Cnidus. More refined and reticent than most of its fellows is one on a statue of Juno by Polycleitus, as follows:—

The Argive Polycleitus, who alone
Had sight of Juno, and that sight has shown,
What of her beauty he could give, has given;
Her unseen charms are kept for Jove in Heaven.

In a couple of epigrams in p. 175 on a fast and a slow runner—the latter a parody of the former—occurs a form of expression which may be meant either for waggery or for purism. We imagine the former to be aimed at. The first runs, as translated in this volume:—

If Ladas ran or flew in that last race,
Who knows? 'twas such a *demon* of a pace;

and in the second it is said of a slow runner:—"He was so demoniacally slow." To our thinking, it is always best to call a spade a spade, and it would help the sense if for "demon" we read "devil," and if for the line about the laggard runner we were to substitute:—"In simple fact he was so devilish slow." There would be no mistaking such intelligible English.

In taking leave of a volume of so much merit, and one which deserves a place amidst all epigram collections, we must again express our regret that it closes an amusing and instructive series; but we hope that it may be followed by another in illustration of the less known poets and prose-writers of antiquity.

NAPIER'S MANUFACTURING ARTS IN ANCIENT TIMES.*

GREATER skill in arranging his materials, with stricter accuracy in revision of the press, might have made Mr. Napier's book on ancient arts and manufactures an excellent manual of a popular kind. He brings to his task a competent practical knowledge of the chief processes of manufacture, and has collected a considerable mass of information upon the several subsidiary branches of the subject which is desultory indeed, and to a great degree second-hand, yet in itself valuable and suggestive. It is the want of literary tact and of critical faculty that takes off so much from the result of any kind of technical training and industrious reading. The book in its present shape has grown, he tells us, out of an earlier work on a smaller scale upon ancient workers in metal, his later researches and practical experience having led him to incorporate into his original design sundry other trades or manufactures the early history of which calls for technical knowledge as well as antiquarian research. The writer to some extent disarms criticism by apologizing for the want of a classical education, whilst he has on his side the plea that men of learning might be spared many a blunder by the possession of a modicum of that skilled training in art or handicraft which has been gone through by working-men like himself.

A succession of wounds to the pride of modern art manufacture has been constantly dealt by the gathering knowledge we have gained of late years of the processes in use among the nations of antiquity. Specimens of handiwork in metal, clay, or textile products, not only defying imitation, but taxing, if not defeating, our powers to analyse or to explain them, have amply vindicated our remote forefathers from the charge of unmixt ignorance or barbarism which the conceit of recent times had been wont to fasten upon them. Whatever may be the advance of later ages, processes chiefly dependent upon mechanical aids or collective labour and skill, it may be questioned whether anything in our day comes up, in point of purity and delicacy of taste, in fineness of hand and eye, in the sense of form and colour, or even in the quality of products, to what was turned out by the individual workers of old. Where are now canoes or intaglios cut like those of Greece and her dependencies, gold and silver beaten or cast, or both processes combined as in the ornaments of Etruria, Assyria, or the isles of the Mediterranean? How are we to explain the proofs which meet us in the quarrying and working of granite masses and in otherwise dealing with obdurate substances, whether in stone or metal, of the possession and use of implements of a temper or consistence unknown in existing art? Speaking even of

* *Manufacturing Arts in Ancient Times, with Special Reference to Bible History.* By James Napier, F.R.S.E., F.C.S., &c. London: Hamilton, Adams & Co. 1874.

the vast masses of the precious metals, or of other accumulations of natural wealth, with every allowance for uncertainty in the figures or for exaggeration in the chronicling of bygone centuries, there is enough in what has been set beyond doubt by authentic records and existing memorials of the past to tax to the utmost the sagacity and the interpretative skill both of critics and of men of science. We need scarcely go as far as Mr. Napier, who, taking the work set down in the Bible record as gold or golden to be the pure metal in solid masses, weight for weight, gets for the accumulation of David's single reign gold to the value of 591,925,000*l.*, and silver 348,004,687*l.* Nor need we fall in with what we understand to be the popular view of Nebuchadnezzar's image, three-score cubits high, having been of solid gold from head to foot. The difficulties of the subject are great enough without encumbering it with traditional or vulgar assumptions wholly uncalled for by anything in the record. We regret that men of Mr. Napier's common-sense cannot shake themselves free from conventional notions such as these, and allow for the nonce that all may not be solid gold that glitters. In treating as he does at great length of the golden calf, upon which he brings his practical knowledge of metallurgy to bear with good effect in part, he might have come nearer than he has done to a solution had he given more heed to what we are told of the composite nature of the image dreamt of by Nebuchadnezzar. Olay, we read, entered largely into its composition. The feet, at all events, were seen to be of that material. The sheer irrationality of supposing such a mass of pure metal to have been moulded and upreared might have led him to consider whether the substance of the calf might not, like the visionary image, have been of clay or gypsum, or other material easily ground to powder, overlaid with gilding or with gold in laminated or other form. With the problem of grinding gold to powder he is, at all events, needlessly voicing himself. There is much ingenuity in his taking the successive processes of Moses to have been (1) reducing the calf to bars or ingots in the fire; (2) "stamping it," *i.e.* beating it out into thin lamina or leaves, gold-beating being an art as well known to the Egyptians as in our day, as shown by mummy cases and ornaments of ancient date; (3) "grinding it very small, even until it was as small as dust"—in other words, reducing the gold-leaf to powder between stones or in a mortar, in which state it could be easily mixed with water and drunk by the idolatrous people. The only question is, could we not more readily conceive gold-leaf to have been applied in the first instance as a coating to a case or mould of some earthy substance, easy to grind and to dissolve in water? Would not the like suggestion equally avail to explain the burning of altars, as in the case of Josiah, together with stamping them and casting the powder upon the graves of the children of Israel? Mr. Napier and the critics to whose remarks he gives much space in his chapter on gold and silver might have spared themselves not a little painful discussion of the feasibility of dissolving gold in some chemical fluid peculiar to Egypt, or melting it with some such substances as sulphur and an alkali, possibly with *natron*, that being plentiful in the country, and by consequence, we presume, in the Desert. Our author is a little hard upon scholars and theologians in regard to their ignorance of technical matters not immediately within their professional ken. It might be questioned in return whether he has been adequately alive to the light which the independent critical faculty might throw upon processes in which he professes himself an expert.

In his chapters upon copper, bronze, iron, and other metals of familiar or domestic service the author makes good use of his practical knowledge and experience. Starting from the distinction between copper and brass, which are habitually confused in our version of the Bible, he gives a popular description of the metallurgy of the ore and its alloys, pointing out what differences are to be traced or suggested between the primitive and more recent processes. The observations of explorers in modern times are brought in to explain the practice of the Egyptian or Syrian workers, whose furnaces and refuse materials still mark the scene of their labours, whilst the analyses of coins, implements, vessels, and arms, by eminent chemists and metallurgists, combine to illustrate the practice of the earliest known workers in metallic products, and to vindicate their historical reputation for skill and taste. Mr. Napier's experimental knowledge, together with a closer attention to the terms of the Homeric text, enables him to correct Mr. Gladstone's strange conclusion that the fusion of metals was unknown at the period which Homer described, or when the poet wrote. Not only do the descriptions of Homer and other early poets show ample familiarity with the casting of metals, but the discovery of bronze moulds of an early period tends in the same direction. Nor is there, as Mr. Napier urges, any practical sense in which "stubborn" can be applied to copper when compared with gold and silver. To bronze the epithet is with much more fitness applied, and it is our author's conclusion that in his version and criticism of the *Shield of Achilles* Mr. Gladstone has made copper and bronze change places. Of all the speculations hazarded by so distinguished a scholar, the oddest is that of the age described by Homer having been that known to archaeologists as the age of copper, following that of stone, yet distinct from that of bronze, and still more from that of iron. The mention as early as the Book of Numbers of *bedil*, which all commentators and dictionaries make to be tin, is not a little puzzling when connected with the fact that nowhere save in Britain is any available source of that metal even suggested. That, either in a prepared state or as natural ore,

tin found its way from those islands to the East at an astonishingly early period, probably through the medium of Phœnician traders, is as much borne out by our author's practical judgment as by the researches and inferences of archaeologists. That the oxide of tin was used by the Egyptians and Assyrians for enamelling and glazing earthenware is a recent discovery, illustrating further the familiarity of the Eastern nations with this foreign metal. Our author is enabled to dispose of certain difficulties felt by Beckmann and others in regard to *bedil* being applied to a mixture of tin with lead or with the refuse from the refining of silver. The ignorance of writers like Pliny concerning the practical processes of manufacture has introduced great confusion into the terms employed by them. In our own workshops similar obscurity is caused by solder being technically called "tin," although known to have much lead in it. In the passage from the *κασμίτις* of the Greeks to the Latin *stannum*, from which have been formed the French *étain*, the High German *Zinn*, and the Low German and English *tin*, the distinction between the pure metal and its mixed state has not been clearly kept in view. With the practical facts bearing upon this subject Mr. Napier need hardly have hashed up Bochart's ridiculous derivation of Britannia from the Hebrew *Barab-anac*, the "land of tin."

In his chapters on dyeing and weaving, which were not included in his former work, Mr. Napier sets himself to pursue the same analytical and deductive course which he has adopted in the previous parts of his book. His conclusions are based upon examination and analysis of ancient fabrics, together with such notices as we possess of the tissues and colouring agents in use amongst the ancients. That silk was known to the Assyrians, and may have been worn by the Jews, if not actually mentioned by Ezekiel in the passage in which "silk" is the word in our translation, he is convinced in concert with the most trustworthy commentators. The absence of cotton among all mummy cloths need not, he maintains, militate against the strong probability that it had at an early period found its way into Egypt, if not Palestine, from India. The limited means of colouring these tissues, as well as linen and leather, a list of which is here given, including earthy and mineral salts, with vegetable and animal matters, speaks well for the skill of these who could produce hues so varied and so intense. Of these hues, some, like that of the Tyrian purple, are not less difficult to identify than are the processes which yielded them, vaguely set forth as they are by Pliny as our chief authority. Mr. Napier's practical experience enables him to criticize these notices of the ancients with good effect, while he is able to speak of his own success in obtaining a beautiful permanent purple from *purpura lapillus*, found in Arran, which like those of Colonel Montagu was found to answer upon cotton without a mordant, excelling in this respect all the far colours, and rivaling indigo. That the ancients used the oxide or the salts of tin, without which a modern dyer could hardly produce permanent tints with some of the drugs enumerated, there is no positive evidence to show. The absence of yellow and green among the colours mentioned in Scripture is not less difficult to explain, whether we refer it to grounds of symbolism or to the want of good permanent dyes of either hue. That glass-making was one of the arts brought with them by the Jews out of Egypt our author with reason thinks highly probable; the blessing of Zebulon by Moses as "sucking treasures hid in the sand" may be taken to refer to this art, supported as it is by Pliny's mention of the land of Zebulon as the seat of glass manufacture. In the art of introducing various colours homogeneously into the same vessel the Egyptians seem to have gone beyond any workmen of the present day. In some processes such is the delicacy in delineating feathers and foliage and similar details as to call for the aid of magnifying power to make them out, involving the conclusion of a lens having been made use of in the manufacture. At Nineveh, it is well known, a lens of crystal was actually found by Mr. Layard.

Upon the building materials of the East in ancient times Mr. Napier has collected much valuable matter, including analyses of various kinds of cement or artificial stone from Egypt, Assyria, and the Holy Land. He closes with a marvellous chapter on the Ark of Noah, the pious simplicity of which in these days of doubt, denial, and halting between opinions is quite refreshing. As a practical man, standing apart from all theoretical difficulties or critical cavilling, he feels himself simply called upon to make, so to say, a model from the received text, or to lecture upon a vessel so constructed. He calls for 25,000 loads of wood. Whether metal tools would be available he has some doubt, but the use of flint or other stone implements would certainly account, he thinks, in a measure for the length of time spent in building, while the use of pitch within and without would obviate decay for the 120 years so consumed. When, however, he is tempted to yield to the insidious suggestions of a German author, that, to promote or to secure the comfort of the family shut up within, "God put all the inmates of the Ark into an hibernating state, and awakened them after the waters were abated," we can but feel that the best advice that can be given to a practical man of whatever class is to stick to his last. It would only have been, however, within the limits of practical workmanship to have kept out misprints so atrocious as Arabia Petria, Sardanapolis, Stahl, and such like, and to have presented to us the Astronomer Royal for Scotland somewhat more correctly than as Professor Piazza Smith.

AMERICAN LITERATURE.

IN a certain sense it may almost be said that the history of slavery in the United States constitutes the history of the country during the past half-century. The Seven Years' War had for its result the destruction of French power on the American continent, and consequently, when the United States established their independence, they found themselves so happily circumstanced as to be safe from foreign aggression. Already Spain seemed to be in the last stage of decadence, and the republics which have taken her place have developed as little ability to govern, and as little power, as Spain herself. As for our own country, since we recognized the independence of the Union our sincere desire has been to cultivate with it the most friendly relations. First the great revolutionary war compelled us to devote all our energies to self-preservation, and then the rapid growth of our empire in India turned our attention to another continent, and made American affairs quite a secondary consideration. We should have been only too happy then had we been permitted to leave America to its own devices. The United States, indeed, have not always allowed us to do so, but still they have been so happily placed as to be able to feel sure that, unless they chose to provoke a quarrel themselves, they would not be attacked. The circumstance has not proved altogether an unmixed blessing, for it has removed all outward restraint upon internal dissension. It is probable that the slavery question could not in any case have been settled without an appeal to arms, but it is certain that the course of events cleared the ring, and placed North and South face to face in the centre; and thus it came to pass, as we have said, that the controversy with regard to slavery almost makes up the public life of the United States during the past half-century. Under these circumstances it is natural that the controversy should seem to an American to deserve the most minute and detailed exposition, and this accordingly Mr. Wilson, in his *Rise and Fall of the Slave Power in America**, has undertaken to supply. But his work makes a demand upon the patience of his readers which few, we apprehend, will be willing to accord. The second volume, which now lies before us, begins with the admission into the Union of the two States of Iowa and Florida in March 1845, and it ends with the election of Mr. Lincoln in November 1860. It thus comprises the history of little more than fifteen years and a half—and the history, be it remembered, not of the country but of a single question—yet it contains no fewer than 704 large octavo pages. It is true, indeed, that these fifteen and a half years immediately preceded the Civil War, and the controversies then raised made that war necessary. But as merely preparatory to the war, the subjugation of the South, the emancipation of the negroes, and the reconstruction of the conquered States, the expenditure of space is surely inordinate. Nor does the treatment of the subject compensate for the long-windedness of the narrative. The work, or at any rate the earlier part of it, originally appeared in a New York religious weekly paper, and its style is such as a knowledge of this fact would lead us to expect. But, in truth, Mr. Wilson has few of the qualifications of an historian. His partisanship is the least of his faults. To do him justice, he does not affect impartiality. And, being thus put upon our guard, we should have little cause for complaint if he made the past live over again as he sees it himself. But though Mr. Wilson is possessed of considerable ability—being a self-made man who has raised himself from a humble station to the Vice-Presidency of the United States—he has the ability of an effective stump orator, not of a scholar and historian. He overloads his pages with dry and lifeless summaries of Congressional debates, but he fails to call up before the mind a living picture of the events he records, or of the men who occupied a conspicuous position with regard to them, and he scarcely attempts to portray the real working of slavery or the actual condition of the South. References to the lash and the manacle, the slave pen, and the auction mart, we have, of course, in superabundance. But of the everyday life which lay beyond them there is nothing. And even these, tempting themes though they may be for the pen of an old abolitionist, are not painted. In a word, the book is an overgrown and heavy pamphlet, full of declamation and spiritless narrative. And yet the events to be related are sufficiently stirring. The acquisition of Texas, recorded in the former volume, had made war with Mexico inevitable, and General Taylor had accordingly been despatched to the Rio Grande. Mexico, as the reader knows, was speedily brought to terms, and the possession of additional territory as well as of Texas was secured by treaty. The manner in which this war had been entered upon, and the great extension of slavery which ensued, gave new force to the abolitionist agitation in the North, and made more active the "underground railway," as the organization for aiding the escape of runaway slaves was called. These circumstances in turn reacted upon the South, and gave rise to the demand for a Fugitive Slave Act. The Act was passed in 1850, and from that moment civil war became inevitable. Millions of people, who had little objection to slavery in the abstract, and who would never have thought of interfering with it in other States, resented being called upon to aid actively in returning slaves to captivity. And thus the Act, while seeming to strengthen the institution, did more to destroy it than any other single measure. Then followed the repeal of the Missouri Compromise, which still further strengthened the anti-slavery feeling. It at once called into existence the Republican party, whose programme was re-

sistance to the further spread of slavery, and especially to its introduction into the Territories. Next came, in quick succession, the Kansas struggle, the Dred Scott decision, John Brown's invasion of Virginia, and the election of Mr. Lincoln, all leading up inevitably to secession and civil war.

The United States preceded this country by eleven years in instituting a regular periodical enumeration of the people. The first American census was taken so long ago as 1790, and consequently that of 1870 was the ninth. The complete results of this latest census have been published in two forms. The perfect edition is in three quarto volumes. It is enriched by an instructive commentary supplied by the Superintendent of the Census, and its value is still further increased by a series of admirable maps, illustrating to the eye the information contained in the dry tables of figures. A less perfect edition in one thick octavo volume contains all the statistical tables of the three quarto volumes, but it is without the maps which make them so readily intelligible and so instructive, and it is also without the greater part of the observations of the Superintendent of the Census. In addition to these two publications, which, as we have said, contain all the statistics of the census, the first eight tables relating to population, being about one-third of the first quarto volume, have been printed in quarto shape by order of Congress, under the title of "Statistics of Population."† This is the volume which now lies before us. It is unaccompanied by explanatory observation of any kind, and consists solely of dry statistical tables. We are first given the population at each of the nine censuses of each State and Territory in the Union classed as white, free coloured, slave, Chinese, and Indian. Next we get the same by counties. Then we are shown the population at the three last censuses of the civil divisions less than counties, classed as white and coloured. And, lastly, we are presented with a series of tables showing the different nationalities of the existing people of the United States.

Two other instalments of the last American census come next in order, but they belong to the last of the three quarto volumes, that upon the industry of the United States. That volume consists of three parts. And the instalments before us are the first two of these, containing respectively the statistics of wealth, taxation, and public indebtedness ‡, and of agriculture. §

Some time before Gustavus Adolphus of Sweden involved himself in the Thirty Years' War, one William Urselius, a native of Antwerp, proposed to him the formation of a trading Company which was to extend its operations to Asia, Africa, and Magellan's Land, and more especially to plant a Swedish colony in the New World. Spain, England, and Holland had already founded settlements on the American continent, and the Swedish monarch, full of projects for the aggrandizement of his country, caught eagerly at this new plan for adding to the wealth and revenues of his kingdom. Accordingly he granted Urselius a charter for his proposed Company, and also issued letters patent inviting all classes of his subjects to aid in the project. But the King's participation in the great religious struggle that was then desolating Germany for a while postponed the realization of the plan, and his death at Lutzen broke up the company. Chancellor Oxenstiern, however, who governed Sweden during the minority of the young Queen Christina, did not allow the idea to drop. A second Company was formed under the direction of another Dutchman, and in 1637, eleven years before the termination of the Thirty Years' War by the Peace of Westphalia, an expedition was fitted out in two ships—a man-of-war and a smaller vessel described as a yacht—which founded the colony of New Sweden on the Delaware River. The history of this little-known settlement, which included the present State of Pennsylvania, with parts of neighbouring States, was written in the middle of the last century by a Swedish clergyman, who had spent many years among the descendants of the colonists, and was dedicated to Queen Louisa Ulrica, in a loyal and manly epistle, in which the good minister deprecates the loss to his country of what might have been a source of wealth and strength. The old history of Acrelius § has now been translated for the Historical Societies of Pennsylvania and Delaware, and published by the former. The colony retained its connexion with the mother-country less than twenty years, having been conquered by the Dutch in 1655, and before the close of the century it passed with all the dominions of the States-General on the American continent into the possession of England. But for fully a century afterwards the colonists continued to speak their mother-tongue, and were regularly supplied with clergymen from Sweden. This Swedish settlement is especially noteworthy for having initiated the policy which has reflected so much credit on the name of Penn. The Swedes purchased from the wild tribes among whom they settled the land upon which they established their colony. As the tribes did not understand the real import of the transaction, and were indeed incapable of comprehending such an idea as the right of exclusive individual property in land, this fact, standing alone, would say little. But the historian of

* *Ninth Census of the United States: Statistics of Population.* Tables I. to VIII. inclusive. Washington: Government Printing Office. London: Trübner & Co.

‡ *Ninth Census of the United States: Agriculture.* Washington: Government Printing Office. London: Trübner & Co.

§ *A History of New Sweden.* By Israel Acrelius. Translated by W. M. Reynolds, D.D. Philadelphia: Publication Fund of the Historical Society of Pennsylvania. London: Trübner & Co.

* *History of the Rise and Fall of the Slave Power in America.* By Henry Wilson. Vol. 2. Boston: Osgood & Co. London: Trübner & Co.

the colonists assures us that they continued to live on the most amicable terms with the Indians. And he shows that the original instructions of the Swedish Court urged with special emphasis the observance of a friendly conduct towards the aborigines.

So large a proportion of the population of America is now Irish by birth or by immediate descent, that it is natural there should flourish on the other side of the Atlantic a literature quite as Irish in tone and character as that which issues from Dublin itself. It is possible, however, to discover a difference between the popular literature of the Irish in the United States and that of the Irish at home. The former is less Catholic and more national. That is to say, it is less sectarian, and aims less at exalting Catholicism. It is more thoroughly informed by the lay spirit, and acknowledges more sincerely all classes, creeds, and races of the Irish population as fellow-countrymen. Of course there are plenty of exceptions on both sides, but we are speaking now of the broad and general characteristics. And in these the literature of the American Irish only reflects their political temper. The Fenian Brotherhood, it will be remembered, was almost fiercely anti-clerical in spirit. In *Oliver Lacey** this characteristic is very strongly shown. The book is written by a woman—a fact in itself noteworthy. And the plot is laid at the time of the Irish Rebellion of 1798. That rebellion has formed the subject of so many novels and plays that its interest ought to be exhausted by this time, one would think. Yet it still exercises a powerful attraction upon popular audiences, as the popularity on the English as well as the American stage of dramas laid at the time sufficiently proves. But it is in the treatment of the plot that the unsectarian spirit is most clearly displayed. The heroine, the hero, and, indeed, the interesting personages but with few exceptions are all Protestants. No doubt, this is true to historical fact, as the chief leaders of the United Irishmen did not belong to the popular creed. But this faithfulness to historical truth, not being the exception but the rule, does not diminish the significance of the treatment.

Though dealing with a different country and a very different state of affairs, *Moss Evans*† is yet animated by a somewhat similar spirit. It is a tale of South Carolina life in the years that immediately followed the close of the Civil War. It carefully avoids the military struggles of the war, the sufferings and the desolation which they caused, and confines itself to a presentation of the social and industrial confusion that followed the overthrow of the South and the emancipation of the negroes, and the efforts made by the Southern whites to accommodate themselves to the altered condition of affairs. The book is written in a very commendable spirit, its object being to excite a kindly feeling towards men who fought so bravely and suffered so much. But it presents an idealist, not a realistic, view of Southern life during the reconstruction period. The author writes from imagination, not experience, and in his desire to conciliate estranged feelings he draws too Arcadian a picture. The "carpet-bagger," in the shape of a Yankee land-jobber, proves a general benefactor, dispossessed planters act like fathers to their former slaves, while these latter look up with mingled reverence and affection to their ancient owners.

The next book upon our list is also a novel relating to life in the Southern States.‡ But in this case the plot is laid in the times before the war, and is descriptive of society in a slave-owning community. The book, however, is not an abolitionist work, but is written with the true artistic aim of presenting a picture of manners, usages, beliefs, and prejudices now passed away for ever. The author draws the portraits of his slaveowners with no unfriendly hand, and he thinks it necessary to explain in a preface that principles which are now everywhere admitted were, at the time of which he writes, universally rejected by the most moral and conscientious people of the Southern States. His book is by no means a defence of slavery, nor does it conceal the evil influence of slavery on Southern society and Southern sense of right. But it is still a friendly picture, which professes to be based on personal experience, every scene, we are told, having been suggested by an actual occurrence, and several of the characters being portraits taken from the life.

The next two novels call for little notice. *Serape*§, though styled a novel of New York, has little that is distinctive about it; while the *Second Wife*|| is only a translation from the German.

We have next to notice a handsome edition of Shakespeare's *Midsummer Night's Dream*¶, published by Messrs. Roberts of Boston, and profusely illustrated by the American artist, Mr. Konewka.

For some years the earliest known form of our English language, Anglo-Saxon **, as it is usually called, has been studied at Lafayette College, in the State of Pennsylvania. For the use of the

students there Professor March undertook to prepare a grammar of the language, which grew under his hand until it became a *Comparative Grammar* in which the forms of the Anglo-Saxon are illustrated by those of Sanskrit, Greek, Latin, Gothic, Old Saxon, Old Frisian, Old Norse, and Old High German.

Osgood's *Guides to New England** and the *Middle States*† are intended to supply such information as will enable the traveller to visit the places worth seeing in these States with the least expenditure of time and money.

When British Columbia entered the Canadian Confederation it stipulated that the Dominion Government should construct a railway to connect the Pacific coast with the Canadian network of lines. The existing Canadian railway system may be said to terminate westwards in the immediate neighbourhood of Ottawa, the capital of the Dominion. From that point the Pacific Ocean is distant about 2,700 miles, say as far as the Ural Mountains are from the coast of Brittany. The intermediate region has a breadth varying from 300 to 500 miles, and may be roughly said to comprise about a million square miles. This vast country was almost totally unexplored, and it will be seen, therefore, that without a railway the entrance of British Columbia into the Confederation would have remained without result. Indeed the colony on the Pacific would have been practically nearer to London than to Ottawa. To carry out the stipulations of the treaty, an exploratory survey was set on foot, and there lies before us now the Report of the chief engineer employed in that work.‡ The Report furnishes an immense mass of new and interesting geographical information respecting the Northern part of the American Continent. For example, we have been accustomed to regard the great lakes and the river St. Lawrence as constituting the main drainage of British America. It turns out now that this is a complete mistake, and that, as a matter of fact, the great watercourse in question drains no more than one-tenth of the area, while twice that proportion, or one-fifth of the whole area, drains into the Pacific, and actually seven times as much drains into the Arctic Ocean.

As the Dominion Government is engaged in exploring its central regions for the purpose of drawing into closer communication its settled portions, so the United States Government is similarly employed in its vast Territories for the purpose of throwing them open to colonization. In the course of the work there has been gradually accumulated much new material in all departments of natural history, and the Federal Government with wise liberality has now begun to publish in a separate and accessible form the information thus collected. Of the publications§ thus determined on there lie before us the two first numbers, and likewise a descriptive Catalogue of the Photographs taken in the course of the geological survey during the years 1869-73.

Another Report illustrative of the natural history of the United States is that upon the invertebrate animals of Vineyard Sound and the adjacent waters||, which contains in addition an account of the physical features of the region.

Still another is the *Synopsis of the Flora of Colorado*¶. The materials for this work were derived from the Geological Survey, and it is put forward as the first of a series of handbooks for the use of students in natural history, intended to be published from time to time among the "miscellaneous publications" of the survey.

The last work of this class on our list is that of Mr. Hunt on the coal and iron ores and industry of Southern Ohio.** The materials for the work are drawn chiefly from official sources, but it is a private publication.

Two medical contributions complete our list. That of Dr. Flint on *Conservative Medicine*†† is a mere collection of essays some of which appeared in medical journals, and some were addressed to popular audiences. It takes its name from the first paper. Dr. Lincoln's *Electro-Therapeutics*‡‡, on the other hand, is intended as a manual of medical electricity, its aim being to supply the general practitioner with an analysis of the principles which ought to govern his use of electricity.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 58 Boulevard de Strasbourg.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsvagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsvagent in Town or Country on application to the Publisher.

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 987, SEPTEMBER 26, 1874:

- Germany and Denmark. Sir George Bowyer, "Nemo," and the *Saturday Review*. The Coalition in Maine and Loire. The Railways and the Public. Spain and Europe. New Orleans. Irish Juries. The National Society and the Education Act.
- Cynicism Past and Present. The Tourist Self-Portrait. The Reunion Conference of Bonn. Yachting. Pauper Girls. A Summer in Spain. The Moral Education of the Parisians. Local Fêtes. The Luxemburg Route.
- Yonge's History of the Revolution of 1688. The Lenox Collection. Romania. By Still Waters. Somerset Archaeological Proceedings, 1873. Lord Kames's Greek Anthology. Naples's Manufacturing Arts in Ancient Times. American Literature.

CONTENTS OF No. 986, SEPTEMBER 19, 1874:

- Denmark, Prussia, and Schleswig.—M. Guizot.—Stroud Politics.—The Geneva Congress.—The Ephemera and the Empire.—The Railway Commission.—A French View of English Politics.—The Break of Gauge in India.
- Dreams.—Legends of the Bengal Famine.—Novel-Reading.—Double Christian Names.—Norway. II.—The Congress of Orientalists.—The Thorne Massacre.—The Cheap Routes to Paris.—The St. Leger.
- Mr. Robert Buchanan's Poems.—Ode's Crusades.—Chappell's History of Music.—Masson's French Dictionary.—Sir Andrew Balfour's Letter-Books.—St. Augustine's, Canterbury.—Once and For Ever.—German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the TOMB," with "The Dream of Pilate's Wife," "Night of the Crucifixion," "Christian Martyrs," "The Descent from the Cross," "The Resurrection," "The Ascension," "The Pentecost," "The Last Judgment," &c., at the DORÉ GALLERY, 35 New Bond Street. Tel. Six.—Admission, 1s.

SOCIAL SCIENCE CONGRESS, GLASGOW, September 30 to October 7.

President.—The Right Hon. Earl of ROSEBURY.

President of the Department.

The Right Hon. Lord MONCRIEFF.

The Right Hon. Lord NAPIER and ETTRICK, K.T.

The Right Hon. LYON PLAYFAIR, C.B., F.R.S., M.P.

Sir GEORGE CAMPBELL.

President of the Council.

G. W. HASTING, Esq.

Prospectuses and Particulars may be had at the Office, 1 Adam Street, Adelphi, W.C.

C. W. RYALLS, General Secretary.

FOURTEENTH CHURCH CONGRESS, BRIGHTON, 1874.

OCTOBER 6, 7, 8, and 9.

PROGRAMMES AND TICKETS ARE NOW READY.

Members' Tickets (not transferable), each admitting Ladies and Gentlemen to all the meetings of the week, except the Free Meeting for the Working Men on Thursday Evening, for which a limited number of Special Tickets (for Members of Congress only) may be had at 2s. 6d. each. Applications by letter must be accompanied by a remittance, and name and address of everyone for whom a Ticket is required. The Committee do not recommend payment to be made by stamps; but if so made, two extra stamps must be sent for each Ticket. P.O. Orders should be made payable to

FREDERICK M. WELSHFORD, Acting Secretary.

Temporary Office: Central Schools, 40 Church Street, Brighton.

Personal attendance from Ten till Two.

ST. THOMAS'S HOSPITAL, Albert Embankment, Westminster Bridge, S.E.—The MEDICAL SESSION for 1874 and 1875 will COMMENCE on Thursday, October 1, 1874, on which occasion an ADDRESS will be delivered by Mr. MACCORMACK, at Two o'clock.

Gentlemen entering have the option of paying £40 for the First year, a similar sum for the second, £20 for the Third, and £10 for each succeeding year; or, by paying £100 at once, of becoming Perpetual Students.

MEDICAL OFFICERS.

Honorary Consulting Physicians.—Dr. Barker and Dr. J. Riston Bennett.

Honorary Consulting Surgeons.—Mr. Frederick Le Gros Clark.

Physicians.—Dr. Peacock, Dr. Bristow, Dr. Clapton, Dr. Murchison.

Obstetric Physicians.—Dr. Baer.

Surgeons.—Mr. Simon, Mr. Sydney Jones, Mr. Croft, Mr. MacCormack.

Ophthalmic Surgeon.—Mr. Lushington.

Assistant Physicians.—Dr. Stone, Dr. Ord, Dr. J. Harley, Dr. Payne.

Assistant Surgeons.—Dr. Gervie.

Assistant Surgeons.—Mr. F. Mason, Mr. Henry Arnott, Mr. W. W. Wagstaff.

Dental Surgeon.—Mr. J. W. Elliott.

Assistant Dental Surgeon.—Mr. W. G. Ranger.

Assistant Surgeon.—Dr. Turner.

Assistant Surgeon.—Mr. McKellar.

Apothecary.—Mr. H. W. Jones.

Medicine.—Dr. Peacock and Dr. Murchison. Surgery.—Mr. Sydney Jones and Mr. MacCormack. Obstetrics.—Dr. Baer. Pathology.—Dr. Bristow and Dr. Clapton. Dr. Ord and Dr. J. Harley. Anatomy.—Mr. Francis Mason and Mr. W. W. Wagstaff. Lectures on the Dissection Room. Anatomical Lectures, Mr. Bristow and Dr. B. W. Reid. Lectures on the Dissection Room. Anatomical Lectures, Mr. Bristow and Dr. B. W. Reid. Lectures on the Dissection Room. Anatomical Lectures, Mr. Bristow and Dr. B. W. Reid.

T. B. PRACOCK, M.D., Dean.

R. G. WHITFIELD, Medical Secretary.

Any further information required will be affixed by Mr. WHITFIELD.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

SCHOLARSHIPS IN SCIENCE.

Two Scholarships in Science have been founded at St. Bartholomew's Hospital:—
1. An Open Scholarship of the value of £100, to be held for one year, to be competed for in September. The Subjects of Examination are Physics, Chemistry, Botany, and Zoology. The Successful Candidate will be required to enter at St. Bartholomew's Hospital in October next.
2. A Public School Scholarship of the value of £50, to be held for one year, to be competed for in October next, by Students of the Hospital of less than six months' standing. The Subjects of Examination are identical with those of the Open Scholarship.
For further particulars and syllabus of subjects, application may be made, personally or by letter, to THE WARDEN of the College, St. Bartholomew's Hospital.

UNIVERSITY OF LONDON. MATRICULATION and PRELIMINARY SCIENTIFIC EXAMINATIONS.

SPECIAL CLASSES for these Examinations are held at St. Bartholomew's Hospital. The Classes are confined to Students of the Hospital.
A Class for the Matriculation Examination is held twice in each year, from October to January and from March to June.
A Class for the Preliminary Scientific Examination is held from January to July.
For particular application may be made, personally, or by letter, to the WARDEN of the College, St. Bartholomew's Hospital.

NOTICE.—ROYAL SCHOOL OF MINES, Jermyn Street, London.—The TWENTY-FOURTH SESSION will BEGIN on THURSDAY, October 1. The lectures may be had on application.

TRENNAM BEEKS, Registrar.

UNIVERSITY HALL, Gordon Square, London, W.C.

Principal and Consulting Tutor.

E. S. BEESLY, M.A., Oxon, Professor of History in University College, London.

Vice-Principal and Mathematical Tutor.

J. J. WALKER, M.A., Trin. Coll., Dublin.

Students at University College are received into the Hall, and reside under collegiate discipline. Some of the acts of rooms are now vacant, at rents varying from £12 to £24 for the session. Subsidy references will be required by the Principal from all Gentlemen desiring to be admitted to the Hall.
The Hall will re-open on October 5 next, the day on which the Session of the Faculties of Arts and Laws and of Science will begin at University College, in close proximity to which it is situated.

Scholarships.—The Trustees of the Gilchrist Educational Fund have founded Three Scholarships of £50 each, to be held for one year, to be competed for in June. The Hall, and being awarded every year to the candidate passing highest in the June Matriculation Examination of the University of London.
Prospectuses containing further information, may be obtained on written application addressed to the PRINCIPAL, or to the SECRETARY, at the Hall.

September 1874.

MISS MARY LEECH'S MORNING SCHOOL for YOUNG LADIES will RE-OPEN October 1, at 11 Regent Place, Hyde Park, W.

THE Misses A. and R. LEECH'S SCHOOL (late Belgrave Gardens Square, Hyde Park, W.) will RE-OPEN on October 1, at 65 and 66 Kensington Gardens Square, Hyde Park, W.

KING'S COLLEGE, London.—The Rev. ALEX. J. D. DORSEY, B.D., Lecturer, K.C.L., will resume his LECTURES, CLASSES, and LESSONS at Colleges and Schools on September 29, at 13 Princes Square, W.

STANFIELD HOUSE, Green Hill, Hampstead.—Mr. T. M. JACOBS, A.K.C., assisted by Eminent Masters, receives into his house a very select number of PUPILS to Educate and to Prepare for the Public Schools, into nearly all of which he has been passed by him to high forms. The House and grounds are spacious and are situate near the Heath. Highest references may be obtained from the Nobility and Clergy whose Sons Mr. JACOBS has educated. Further particulars on application.

AN OXFORD GRADUATE, in Honours, an old Marlburian, and late Scholar of his College, now Rector of a Suffolk Parish, receives PUPILS.—Address, Rev. W. EMMA, Great Blakenham, Ipswich.

ARMY, WOOLWICH, and COOPER'S HILL.—Mr. J. ASHTON, M.A. (Gold Medal) London, and Fifth Wrangler, Camb., prepares CANDIDATES for the above. During the present year he has passed seven for Cooper's Hill, two for Woolwich, and six for the Army. —at and 24, and 24, Henry's Road, S. Hampstead.

PRIVATE TUITION for ARMY, COOPER'S HILL, CIVIL SERVICE, WOOLWICH, and UNIVERSITIES.—Rev. Dr. HUGHES (Wragg, Cam.) who has passed over 300, has VACANCIES. Also quite distinct young Boys.—Killing, W.

THE VICAR of Ampney Crucis, Cirencester, has a Vacancy for a PUPIL, reading for the Universities. Moderate Terms.

EDUCATION for BOYS, free alike from Clerical and Dissenting influences, in the Family of a Layman, at CAMBRIDGE M.A. of much Experience. Ages Ten to Fifteen. Terms high.—Address, TROSCHESS, Messrs. Kerby & Spence, Publishers and Booksellers, 190 Oxford Street.

BOARDING SCHOOL for YOUNG GENTLEMEN, MONTEUX, Switzerland.—Herr and Madame RENKOWITZ beg to announce the removal of their Establishment into a spacious and comfortable House, beautifully situated on a eminence, with extensive grounds. They receive a limited number of YOUNG GENTLEMEN especially for the study of the French and German Languages, together with a sound English Education, Terms moderate. Masters resident in the Establishment. References on application to the Principals.

PREPARATION for EXAMINATIONS.—Dr. LEONARD SCHMITZ, Classical Examiner in the University of London, with OPEN, on the 1st of October, a CLASS for Reading Latin and Greek. Classics and History with Young Gentlemen preparing for University and other examinations. A few Gentlemen can be accommodated as boarders in his family.—For particulars, apply to Dr. SCHMITZ, 25 Belgrave Park, Chelsea, S.W.

DAILY TEACHING at Oxford or other large Town in the South of England.—A YOUNG LADY, having some experience in teaching, desires to give LESSONS to DAILY PUPILS. She is qualified to impart a good English Education, with French, Music, Drawing, and the rudiments of Latin and German. Good references. Full particulars given on application to C. L. Epping, Essex.

BRADFORD GRAMMAR SCHOOL.—An ASSISTANT-MANAGER (non-resident) is REQUIRED to teach Arithmetic and Junior Mathematics and English Subjects. Experience in managing large Classes indispensable. Salary £100 per Annum. Apply, with Testimonials, to the HEAD-MASTER.

BRADFORD GRAMMAR SCHOOL.—An ASSISTANT-MANAGER (non-resident) is REQUIRED to LECTURE in Greek and English Literature. He is to assist in the Higher Classical Work. Salary £100 per Annum. Apply, with Testimonials, to the HEAD-MASTER.

ITALY.

THE *Orléans* is said to have really left Civita Vecchia, and the Italians are rid of the last symbol of French interference. It was merely a symbol, for the last shred of real interference disappeared with the catastrophe of Sedan. But after the German war was over, a large and influential party in France found some comfort among the general wreck of things in the thought that at least there was a French frigate in Italian waters ready to bear off the sacred victim of oppression whenever he might choose to go. It was to the Legitimist mind a sort of standing protest against the occupation of Rome that there should be this vessel always there at the command of the Pope, if he chose to take advantage of it. It was a means of proclaiming to the Italians that if for the moment France could not redress the wrong that had been done, it still could proclaim that it was a wrong. Faithful France could at least secure the poor prisoner of the Vatican the means of regaining liberty. The Italian Government naturally disliked this symbol of French protest being kept before the eyes of all men, and it gently but firmly pressed on the French Government the necessity of removing so very slight a source of discord if a really friendly feeling was to be established between the two nations. For many months the French Government has owned that the arguments of the Italian Government were unanswerable. The occupation of Rome is accepted as an accomplished fact by the French Government. If Rome is to be regarded as a secular Italian city, the Pope could only need a friendly frigate in a neighbouring port if he were so badly treated that he really wished to leave Rome. But it is ridiculous to say that he is badly treated, or that he is a prisoner, or that he could not go or be conveyed by the Italian Government anywhere he wished. If it is admitted that Rome is a secular city belonging to the Italian kingdom, the Head of the Romish Church is as handsomely treated as it is possible he should be treated in a city belonging to a secular Power and forming part of a kingdom governed on secular principles. He is merely a prisoner in the sense in which a man who prefers spending a day quietly at home may be said to be a prisoner in his house. If he wished to move about Rome or Italy, he is as free to do so as any human being can be. If he liked to go away altogether, he may enjoy the freedom of a voluntary exile any moment he pleases. He chooses to stay on at Rome, and he chooses to shut himself up in the Vatican. He thus adds the luxury of an imaginary martyrdom to the comfort of doing as he likes best. What possible use can it be to him that the *Orléans* should be stationed at Civita Vecchia? The French Government has long had no reply to make, except to ask the Italian Government not to press its logic at a moment when to own the force of this logic might be embarrassing to the French Government at home. As a compromise, it was arranged that when the French Assembly had dispersed for its session, and the Government could thus choose to withdraw the *Orléans*, should be quietly withdrawn. This arrangement has now been carried out; if it is true that the *Orléans* has really left Civita Vecchia. A slight ray of natural indignation has been raised in some of the French Legitimist journals, which accuse the Government of trucking to foreign Powers, and of abandoning the traditional policy of France. It is possible that the Legitimist Opposition may attack the Government when the Assembly meets again. But the

Government is perfectly well aware that even in the Assembly the support of the Legitimists could not really be secured unless it threw itself into their arms; and that in the country the Legitimists have no real power whatever.

A general election will be held in Italy within a few weeks, and Signor MINGHETTI is expected in the course of the next few days to give a sketch of the policy which he asks the constituencies to support. There are dissensions in Italy as there are everywhere, and it is natural that in a country so long divided and so lately and rapidly united there should be many jealousies and antipathies. But the desire for unity prevails over every counteracting influence, and whether the present Ministry may or may not be as successful as it hopes, there is no reason to doubt that the next Parliament will be mainly composed of moderate Liberals; that is, of persons who desire above all things that the existing state of things—unity with a constitutional monarchy—should continue. The fact is that the Italians have gained so enormously by the recent changes which have made Italy a compact and considerable Power that all their interests are wrapped up in the prevalence of this kind of moderate Liberalism. The stride that Northern and Central Italy have made in the last ten years is astonishing. Everywhere there are to be seen the signs of a rapidly increasing prosperity. Turin, after having ceased to be the capital of a kingdom, has been abundantly recouped by the opening of the Mont Cenis Tunnel. It is now the gateway of Italy. Tourists flock to it, commerce flourishes in it. It is full of magnificent new hotels, and looks much more alive than even in the days when it was the home of the Italian Parliament. Milan and Genoa are advancing with equal rapidity, and it is only by the removal of the Royal Arsenal to Spezia that Genoa has found room for the great activity of its port and shipyards. Venice is venturing to pronounce that to it and not to Trieste the commerce of the Adriatic naturally belongs, and docks are projected on a scale large enough to try the issue of a rivalry which was impossible so long as Venice was Austrian. Changes of Government cannot much affect Florence, for Florence under every Government that secures order must remain one of the most wonderful and attractive cities in the world. It is perhaps in the smaller towns of the neighbourhood, such as Bologna, that the impetus given to wealth, enterprise, and intelligence by the establishment of Italian unity is most visible. Italian towns are not perhaps very fond of each other. Turin is looked on as the capital of a little nation which is Italian only in name. Genoa is theoretically Republican, and it has never quite forgiven its forced annexation to Piedmont after the fall of NAPOLEON. But everywhere there is the same feeling. Italian unity is a success—a source of legitimate pride to all Italians, and a source of most comforting prosperity to individuals. Having got a good thing, the Italians have the sense to wish to keep it, and they are not at all in the humour to let theoretical preferences for a different form of government, or discontent with taxation, or provincial jealousies, rob them of a prize which they won partly through themselves, but mainly by a series of the most wonderful strokes of good fortune that ever befall a nation. Some French journals which are at a loss for something to say have taken up the notion that M. THIERS is going to Italy to determine the policy of Italy, and to release Italy from what is termed the Protections of Prussia. This is a considerable compliment to M. THIERS, for it treats him as a power in France independent of and above the nominal Government of the country. Perhaps most Frenchmen are secretly of opinion that, although for the purposes

of domestic squabbling M. THIERS must go in and out of power like bumbler men, yet if anything European is to be done, anything in which France is to figure through an individual, M. THIERS is the only possible representative of his country. But the Prussian Protectorate is a fiction of French journalists. So long as it seemed possible that there should be a Legitimist Restoration in France, Italy knew that to keep Rome it must make even Legitimists feel that Italy had an ally whom France could not venture to attack. But if France is content to leave Italy alone, Italy can have no desire to be the slave of Germany and the perpetual enemy of France. The withdrawal of the *Orléans*, far from being a concession to Germany, is a sign that the threatened interference of France in Italian affairs which drove Italy to such a protection is at an end. The policy of Italy is to quarrel with nobody. She is in the position of a lucky adventurer who in troublous times has made a large fortune and then wishes for a reign of universal quiet. It is true that, in the struggle between the ecclesiastic and secular powers, Italy and Germany are necessarily bound together because they have a common enemy. But there is no identity between the religious questions at issue in Italy and those in Germany. Italy is not far enough advanced to have the same questions raised in it which divide Germany. It is occupied with the preliminary task of getting life and government and property secularized. It is busy in getting the estates of religious corporations into lay hands, in suppressing wholesale pious mendicity, in taking the administration of practical affairs out of the hands of priests. To this work it is also adding that of popular education. The primary schools of Northern Italy are admirably conducted, and, if inferior as yet to those of Germany, are much superior to those of France. Prussia is long past the Italian stage. It is not troubled with ecclesiastical governors, or vast ecclesiastical properties, or shoals of religious mendicants. It has long settled that every one shall be educated as the State thinks best without asking the permission of the ecclesiastical authorities. The Italians do not regard the questions with which they have to deal as religious questions at all. In their eyes what they are doing is simply political. They are making prudent arrangements about property and education, and that is all. Possibly in time there may be religious questions raised in Italy, but the Italians are a long way off them at present. The priests are of course opposed to the changes which Italy is now making, and which have been long ago made in other European countries, and they are also still more violently opposed to Germany and the policy of Prince BISMARCK; and both Governments have thought themselves obliged to interfere when language has been used by priests which has been considered seditious, and to restrain by force the action of the religious orders or bodies most actively engaged in fomenting opposition. But it is on France, and especially on France under a Legitimist Monarchy, that the priests have mainly relied for the temporal strength that would enable them to combat their adversaries; and the more plainly the French Government shows by such signs as the withdrawal of the *Orléans* that all hope of French assistance or interference is utterly vain, the more Italy and Germany will go on each in its own way, and the less will Italians need or think of a Prussian Protectorate.

CANADA AND LORD DUFFERIN.

LORD DUFFERIN'S speeches at Toronto on his return from his Western tour would alone have gone far to justify his appointment to the Viceroyalty of Canada. As an experienced and rising member of the English Government and of the House of Lords, and as an instructive writer on an important branch of political economy, Lord DUFFERIN might be expected to administer the affairs of the Dominion with success; but it would have been comparatively easy to select a capable man of business. To more indispensable attainments Lord DUFFERIN adds qualities which are useful in the government of men. He has the wit and imagination which befit the great-grandson of SHERIDAN; and he has the humorous temperament which facilitates and attracts sympathy. When he accepted office he was probably aware of the mistake which had recently been committed by a statesman of greater experience than his own, and of much social tact. Lord GRANVILLE, who might have been expected to be one of the most

popular of Colonial Ministers, unaccountably missed his opportunity. It appeared that he had become imbued during some part of his long official life with prejudices which are already obsolete against an Imperial policy; and he also seemed anxious to prove that the courtesy inseparable from his nature had no influence on his political conduct. During his term of office as Colonial Secretary, Lord GRANVILLE ostentatiously slighted the importance of a connexion which is in fact more directly advantageous to the colonies than to the mother-country. To an advocate for the annexation of the Fiji Islands who suggested the possibility that, on the refusal of England, the islands might be acquired by the United States, Lord GRANVILLE replied that in his opinion such an arrangement would be more desirable than the conversion of the islands into an English colony. He sternly refused to delay the withdrawal of Imperial troops from New Zealand, although the feelings of the colonists might have been conciliated without any permanent modification of English policy. Even the Canadians complained that Lord GRANVILLE never publicly repudiated the language in which one or two of his colleagues intimated their indifference to separation.

Lord DUFFERIN went to Canada with a profound belief in the greatness of the Empire, and with a full determination that his sentiments should not be misunderstood by the inhabitants of the Dominion. It is no more the business of a Colonial Governor or of a Colonial Secretary to inquire whether colonies are desirable than of a King to analyse the utility of his hereditary profession of royalty. Soon after his arrival he had occasion to display in difficult circumstances his adherence to the most orthodox theories of constitutional government. His Ministers, including the ablest and most experienced of Canadian statesmen, had the misfortune to be implicated and discovered in the perpetration of a job. When their conduct was attacked in Parliament, they proposed an adjournment to enable them to prepare their defence, and the GOVERNOR-GENERAL at once acceded to their request. The Opposition not unnaturally accused Lord DUFFERIN of complicity after the fact, and at first they failed to understand the force of his reply that in administering a responsible Government the representative of the Crown must follow the advice of his Ministers. It was for Parliament eventually to decide whether the Cabinet retained the confidence of the country; and when the Ministers themselves afterwards anticipated the adverse vote of the House of Commons by resigning, the GOVERNOR-GENERAL without hesitation transferred his confidence to their successors, who had up to that time been the leaders of the Opposition. It was perhaps of this transaction that Lord DUFFERIN was thinking when he told some ill-bred American acquaintances in Chicago and Detroit, who had jested about the annexation of Canada to the United States, that the Canadians would not tolerate the exemption of the Executive power from legislative control. In attributing to democratic feeling adherence to the constitutional English rule Lord DUFFERIN committed an oversight. The true theory of responsible government was created by the aristocratic Parliament of England, which still furnishes to the rest of the world the best example of a constitutional system. The rudeness of foreigners who could refer, in the presence of the GOVERNOR-GENERAL, to a possible annexation of Canada was more characteristically democratic. When the PRINCE OF WALES visited the United States many years ago a similar impertinence was addressed by Mr. SEWARD to the Duke of NEWCASTLE, whose reply showed that he was greatly inferior to Lord DUFFERIN in adroitness, and perhaps in temper.

Even if the Canadian system were more democratic than the American, it would not necessarily be better. There is much to be said for the American system which makes the President independent of Congress; and it is to the credit of the founders of the Republic that they instituted securities against popular caprice which are now more indispensable than in the days of WASHINGTON because the Constitution has become thoroughly democratic. The immediate and certain predominance of the opinion of the majority has been found tolerable in England which has hitherto escaped universal suffrage, and in Canada, because the colony is prosperous, contented, and anxious to adhere to English precedents. A reporter, as Lord DUFFERIN modestly designates his epigrammatic apophthegm, may be tolerated even if it includes a fallacy. There is no doubt that in Canada public opinion acts with sufficient rapidity in the distribution of power. Only a local

interest attaches to a recent change in the provincial Government of Quebec, except that it is attributed to the exposure of a transaction which was represented by the Opposition as corrupt. There are probably two sides to a controversy which it would be a waste of time to examine minutely. American experience shows that democracy tends to create corruption, and it is to be feared that in Canada similar results will follow from the same causes. Thoughtful Canadian politicians have lately complained of the bad effects of a federal system which, by multiplying the number of elected representatives, necessarily diminishes their competence. In a busy community it must be difficult to find one set of honest and able men to become members of the House of Commons, and another upright body to partake in the obscure excitement of provincial legislation. If the humbler class of popular representatives sometimes reward themselves for their trouble by jobs, the best way of removing the evil would probably be to dispense with the services of the local Assemblies. The question concerns the Canadians alone. The Imperial Parliament will neither wish to meddle with their Constitution nor hesitate to concur in any measures which may be necessary for making it more effective. It was probably judicious to copy the American Constitution in its federal element, at a time when some of the provinces were scarcely reconciled to the establishment of the Dominion.

Lord DUFFERIN's brilliant speech at Toronto was received, as it well deserved, with enthusiastic applause. The celebrated Latin oration which he delivered in his youth at Reikjavik was not better adapted to the audience and the occasion. Even if the GOVERNOR-GENERAL had been less eloquent, the description of unqualified prosperity is pleasant, especially when it is known to be true. The universal loyalty and satisfaction which Lord DUFFERIN had encountered during his recent journey was, as he well knew, the most convincing proof of existing prosperity and of unbounded hope. A community which will for a century or two have no need to study the doctrines of MALTHUS is happy in being able with Lord DUFFERIN to count the swarming babies among the most valuable of its possessions. Loyalty is so far the natural consequence of comfort, that a form of government can scarcely be antagonistic to the prosperity with which it co-exists. The Americans also are satisfied with institutions which, though not admirable in the eyes of external observers, are yet found compatible with the wealth and happiness of a community which leaves its Government as little as possible to do. Readers of Canadian newspapers will perhaps be surprised at the unanimous acceptance of Lord DUFFERIN's rose-coloured description of the present and the future. Provincial journalists discern all manner of abuses in the administration of political opponents; nor are the supporters of Canadian Governments slow in denouncing the corrupt intrigues of aspirants to power. Half a dozen elections have lately been set aside for bribery; and the Opposition remark that all the unsated members are supporters of the Ministry which especially affected to represent political purity. A rebel, accused of murder, has lately been returned to Parliament by a Western constituency; and, in spite of Lord DUFFERIN's arguments and repartees, advocates of annexation are still to be found in the Dominion. Nevertheless the more cheerful theory of the condition of Canada is probably the more correct. The colonists who welcomed the GOVERNOR-GENERAL during his progress must be the best judges of their own state and prospects. It may be assumed that any serious and widespread grievance would have been attributed to Imperial misgovernment. If the people of Canada are not even disposed to grumble, they can scarcely be objects of compassion.

MR. GLADSTONE ON RITUALISM.

MR. GLADSTONE has enriched the world at this dull moment with two surprises. Every one was much surprised when he first saw that Mr. GLADSTONE was about to contribute his views on Ritualism to the *Contemporary Review*. Every one will now be still more surprised when he has read what Mr. GLADSTONE's views are, or, we should rather say, are not, upon Ritualism. The peculiarity of the article is that exactly what Mr. GLADSTONE throws no light whatever on is that part of the Ritualistic controversy on which society happens to be very fiercely disagreeing. There are certain first principles of order and

decency in public worship about which all mankind, from Mr. SPURGEON to Mr. MACKONCHIE, are agreed. Mr. SPURGEON would as little think of officiating in his dressing-gown and night-cap as Mr. MACKONCHIE out of his chasuble. Every one is also agreed that variations in worship must oscillate within the vaguely defined space which lies between the absolutely illegal and the absolutely inexpedient. Yet it is precisely upon these general points of agreement that Mr. GLADSTONE through nineteen pages of the *Review* rolls on in the overpowering swing of his full but self-conscious eloquence. When we begin to sight what we should like to hear something about—namely, the mental distinctions or accidental circumstances which make some men SPURGEONS and others MACKONCHIES—Mr. GLADSTONE signs his name and closes the article. If Mr. GLADSTONE's self-imposed reticence during the last Session had been consistent and persistent, if he had never tired of rehearsing ACHILLES or PYTHAGORAS, he might have reasonably persuaded himself that the country had a claim on its late ruler to know what he thought upon a question which people have argued themselves into thinking burning, probably because they have pretty severely burnt their fingers with it. But after he had burst upon Parliament and the world with his second-reading speech upon the Public Worship Regulation Bill, and after he had extinguished Sir WILLIAM HARCOURT's pompous effort to clothe the prejudices of the more foolish portion of mankind in the saucy sophisms of a fluent free-lance, Mr. GLADSTONE had done his public duty to himself and to Ritualism, and was again free to garner up his thoughts in Ilium. Much of Mr. GLADSTONE's article is a general discourse on the artistic shortcomings and expectations of England, WEDGWOOD and Cottage Gardens, Palaces of Administration and Chignons, true enough in itself, and of course set forth in grandly rounded periods. But it is what we have heard so often at South Kensington and at every opening of a provincial art exhibition that we could at last almost wish that the topic could for the future be put in as read. Where, however, he approximates to handling the real subject, he only repeats, not so forcibly because less pugnaciously, positions which, though sufficient in a speech thrown into a heated debate, should have been not merely expanded, but also made specific after a summer's incubation. Even the six famous Resolutions which Mr. DISRAELI slept over and then declared himself unable to understand reappear in the feeble and shrunken forms of six general propositions.

There can be no doubt that it is not only exceedingly foolish, but absolutely wrong, in any clergyman to thrust improvements, however sensible or moderate in themselves, upon ignorant or unwilling congregations, or to exhibit a demeanour inconsistent with the lessons which a high ritual ought to teach. The fault is equally undoubted of congregations which set themselves to put the worst interpretation upon everything that their clergyman does, or proposes to do, which jogs them out of the groove of their old selfish indifference. But the question has still to be answered, how far either clergyman or congregation is likely just at present to be mended by being continually lectured in general phrases after the special points on which they dread any difference have been so clearly mapped out, and have become the subjects of authoritative examination. Perhaps there may also be some fear whether, with Mr. GLADSTONE's passionate confidence in his "own flesh and blood," that reasonable reference to *bona fide* worshippers which every judicious clergyman will maintain may not grow into a condition of things in which the sheep claim to lead and the shepherd has to be content with humbly following.

The question of Ritualism as it now stands before the public—struck before it was heard by Parliament, and at this moment the subject of specific legislation in Convocation—is at once too large and too minute for such a superficial treatment as Mr. GLADSTONE vouchsafes. His venturing to take it up in such a tone shows at least that, with all the breathless unrest of his intellect, there are points on which it must have been singularly impassive of impressions from the moving world. His paper would have been admirably suitable as a declaration in favour of ritual decency in days when the stagnant puddle of Churchwardenism was first stirred by the breath of enlightened opinion, and when Bishop BLOMFIELD almost sent Islington to the barricades by ordering its chosen prophets to preach in surplices. Such a protest at that time against traditional Philistinism would have been in

season from the young ASCANTUS of Oxford. But thirty years have passed since those happy days of youth, and the Ritualistic controversy has in many respects become one of very precise dealing with specific details. The Archbishop of Canterbury and Mr. PURCHAS might both have subscribed to Mr. GLADSTONE's peroration that "the best touchstone for dividing what is wrong and defining what is right in the exterior apparel of divine service will be found in the holy desire and authoritative demand of the Apostle that the Church may receive edifying," rather than "in abstract imagery of perfection on the one hand or narrow traditional prejudice on the other." The misfortune would be that when they began to divide they might find themselves disputing, and when they turned to defining they might leave off by contradicting. "Ritualism," since Parliament and Convocation have busied themselves with ceremonial controversy, has become a direct "transaction," and every party in the Church is now alike putting forward what it wishes or repudiates for itself, and what it would concede or refuse to every other one. Accordingly, the man who undertakes to instruct his fellow-Englishmen upon Ritualism must be prepared to have something specific to urge on the distinct points about which they happen at this moment to be anxious, or he only misleads and vexes them by seeming to promise that which he has no intention of providing. The more highly placed, too, and influential that man may be, the more is he bound to bring into counsel some specific suggestions. Rhetoric, however powerful, language, however sonorous, will not content contending parties when once they have got their blood up, or keep the peace between them while the conflict is still only imminent. The picture, such as that which the writer offers, of that which is now everywhere accepted, but which would not so many years since have been very widely scouted, points a moral; but that moral would rather seem to take the shape of a reasonable conviction that things which are now unpopular may, in another term of years, be cheerfully acquiesced in. We dare say Mr. GLADSTONE intended to say this, but his inveterate habit of invoking the exercise of the popular voice, as if it were the end and not the means of all things, leads him to impute a value to congregational action which might in many cases be found to throw back rather than to foster improvement. In fact, Mr. GLADSTONE's article would form an excellent address for some county magistrate, rather higher than a Lord-Lieutenant and lower than a Cabinet Minister, to read by way of giving a fillip to a Union of Church Choirs or an Archeological Congress. If circulated through the district in an appetizing shape, it would be highly appreciated, and might do much good in the more ignorant and prejudiced circles of middle life. But eminence obliges no less than nobility. When a man so eminent and responsible as Mr. GLADSTONE undertakes to instruct the world upon a question of extreme delicacy and very provocative of unreasoning passions, he is bound to treat it thoroughly or not at all. In the present case prudence and policy would have counselled the not at all.

THE IMPERIALISTS AND THEIR HUMBLE FRIENDS.

THE coalition between the Orleanists and the Bonapartists has had the success it deserved. The Orleanists have sold their principles, and taken no money for them. They have given the lie to all their professions, whether of zeal for constitutional freedom or of hatred of democratic despotism, and before the words were well out of their mouths they have found that they might as well have spared their breath. Politicians who make alliances of this kind should at least be sure of the result for which they play. If M. BRUAS had been returned for Maine and Loire, the solitary triumph of the Septennate might have caused the meanness by which it had been obtained to be forgotten. But when M. MAILLÉ receives 6,000 more votes at the first ballot, while M. BRUAS is unable to poll as many as he and M. BERGER shared between them on the 13th, the issue of the election is not such as to leave the nature of the canvass in the shade. For the first time since the fall of the Empire a French political party has made common cause with the Imperialists, has consented to be beholden to them for support, has treated them as brethren holding the same essential creed, though differing as to particular articles. Unless the victory of the Empire is already won, this spectacle cannot but leave its mark upon the events of the next few months. There is no possibility of

doubting or misrepresenting the fact. The appeal of the Orleanists to M. BERGER was unmistakable, and it was made more so, if possible, by the scorn with which their prayer was granted. M. BERGER dared the MINISTER of the INTERIOR to prosecute him, and then in effect offered him his votes. General DE CHABAUD-LATOUR is a soldier, and it must have gone hard with him to decline the challenge, and to stoop to pick up the ballot-balls. But even a soldier must put his pride in his pocket when he serves as a Minister under the Septennate. The General had to forget that he had said not a month before that he would have prosecuted M. BERGER if his Circular had been printed as a newspaper article, and to see it ostentatiously put into that shape without attempting to make good his threat. Worse than this, he had forbidden the street sale of the journal patronized by M. BERGER, and just when the article appeared this prohibition had to be withdrawn. How can a Minister stop the circulation of a journal which is urging its readers to vote for his candidate? All this has made the action of the Orleanists exceedingly conspicuous. Every Frenchman knows that they have been trading with the Imperialists, and, with this fact once in his head, he must come to one of two conclusions. He may think that the Orleanists did the wisest thing they could do under the circumstances. It is not an exalted view to take of the situation, but then Conservatism which is frightened at its own shadow is not apt to take exalted views. Supposing, however, that the fault of the Orleanists is condoned on the score that the Imperialist alliance was so valuable that it could not be done without, the next thought of a timid Conservative will certainly be that it is the Imperialists, not the Orleanists, who hold the winning cards. The Imperialists have made no advances to their new allies. They have not abandoned or even concealed their hopes or their designs. They have presented themselves to the Orleanists in their true colours as partisans of NAPOLEON IV., and the Orleanists have felt themselves so helpless that they had no choice but to ask their aid. Why should any Frenchman who is minded to join this composite party care to associate himself with the Orleanist wing of it? It is better to act with those who can give help than with those who are reduced to sue for it. It is better to be one of M. BERGER's supporters holding out a disdainful hand to the struggling M. BRUAS than to be one of M. BRUAS's supporters begging hard for the crumbs that have fallen from M. BERGER's table. The new coalition may perhaps gain many recruits, but when the day comes for each element to rank itself under its proper standard, the Orleanists will see the army divided in terribly unequal proportions.

There is another effect, however, which the union between the Orleanists and Imperialists may possibly have upon the nation at whose cost it has been effected. If the hatred of the Empire which existed in 1871 has survived in any considerable degree, Frenchmen cannot but feel startled that a party which at this moment commands the Executive should have forgotten the deliberate rejection of the Empire by the National Assembly. A short time back such forgetfulness would have been absolutely fatal to the political prospects of those guilty of it. They would have been condemned, if not as traitors, at all events as something too nearly approaching to traitors to have any place open to them in French politics. It was not to be expected that this intensity of feeling should last long. It was an exaggeration, and in course of time there was little doubt that it would share the fate of other exaggerations. But unless it has altogether disappeared, the fortunes of the Orleanist party cannot but be seriously affected by the course they have taken in the Maine and Loire election. They have given the Republicans a handle which they will well know how to work; and though, with so many departments in a state of siege, it is not safe to criticize the policy of the Government too openly, the Bonapartists themselves will take care that the fact that they have been asked to do the Septennate a good turn is not too soon lost sight of. The difference between the voting in the first and second ballots in Maine and Loire seems to suggest that some of M. BRUAS's supporters were disgusted at the policy of their leaders, and preferred to vote for the Republican candidate rather than allow the official candidate to win by Imperialist support. It remains to be seen whether this feeling will reproduce itself in the coming elections in other departments. If it does, the Orleanists may find that a little regard to principle would have been more profitable as well as more dignified.

M. THIERS is so sparing of manifestoes that it is not

without significance that he should have chosen this moment for making an elaborate defence of his policy while in office. He again insists on the impossibility—an impossibility admitted by the Monarchists themselves—of doing anything in 1871 except set up the Republic. Except as Chief of the Republican Government, says M. THIERS, “I could not even have passed through Paris to go to Versailles for the purpose of negotiating peace.” The Commune followed, and M. THIERS leaves it to those who witnessed the subsequent struggle to say whether he would “have succeeded in the name of the Monarchy in forcing the gates of Paris.” If he had attempted to re-establish the Monarchy when the Commune was defeated, he would have told the Assembly on one day that he was fighting only for public order, and confessed on the next that he had all the time been fighting for a Restoration. M. THIERS has, no doubt, an object in reminding his countrymen of these facts. He wishes to impress upon them that he became a Republican from necessity, not from choice, and that upon the question of necessity his judgment is likely to be sounder than theirs. If a Monarchy was out of the question in 1871, what that has happened since will make it more possible in 1880? If the dissensions among the Royalists, and the strong passions of the Republicans, have all along prevented the idea of a Restoration from making any real way in the country, what reason is there to suppose that either of these hindrances will be less formidable when Marshal MACMAHON lays down his power, and leaves Frenchmen free to decide under what form of government they will in futuro live? The Legitimists and the Orleanists hate each other far more bitterly than they did in 1871, for the breach between them had not then been healed only to be reopened. The Imperialists were despairing then, whereas now they are sanguine. The Republicans have added to their former grievances against the Monarchists the sense of having been played with and deceived. Considerations of this kind will be no less powerful with moderate men of all parties at the close of the Septennate than they were at the close of the war, and if they are then to lead to the definitive establishment of the Republic, why should the nation go through six years of uncertainty and agitation merely to do at last what it may as well do at first? The Conservative argument for the immediate establishment of the Republic is so cogent that it must have weight with any Frenchman who is not either pledged to an impossible dream or blinded by party hatred to the obvious interest of the country. The cheerful confidence which M. THIERS displays will not be without its influence in persuading the electors that, in voting for Republican candidates, they are identifying themselves with the winning cause.

MR. LEATHAM AT HUDDERSFIELD.

MR. LEATHAM, who is a very clever man, lately selected his favourite topic for a discourse to his constituents with little regard to times and seasons. It is not known whether Mr. LEATHAM's private tranquillity is perpetually disturbed by political hopes and fears; but his public addresses invariably relate to the prospects, the dangers, and the ultimate triumph of his party. A year ago Mr. LEATHAM explained the means by which the Liberals were to perpetuate their tenure of office; and although they afterwards incurred a ruinous defeat because they had partially anticipated his advice, he now encourages them with the hope of an early return to power. If the working-men of Huddersfield are profoundly interested in the subject of Mr. LEATHAM's habitual lucubrations, it can only be said that they are in a different frame of mind from the majority of their countrymen. The number of enthusiasts who would take any trouble to put Mr. GLADSTONE in the place of Mr. DISRAELI is extremely small. Mr. LEATHAM himself indicated a consciousness of the general indifference to the possibility of Ministerial changes by dwelling at length on the immediate occasion of the meeting, which celebrated the anniversary of a local Club. It appears that the Liberals of Huddersfield have a house or apartment of their own, in which they have the good sense to provide themselves with the means of eating, drinking, and smoking. At the risk of offending the temperance fanatics Mr. LEATHAM professed a judicious toleration of beer; and he was probably justified in holding that facilities for obtaining liquor without resorting to a public-house on the whole

conduce to sobriety. To cold-blooded bystanders who are perhaps not exclusively occupied with schemes for insuring the triumph of the Liberal party, it would seem that a Club of working-men would be not less likely to be useful if it were not confined to one political faction. Even a Liberal Huddersfield artisan might sometimes listen with advantage to opinions differing from his own; but politicians of the school of Mr. LEATHAM entirely concur with the Pope and Cardinal Cullen in shrinking from the possible contamination of their disciples by intercourse with political heretics. The Liberal adults of Huddersfield combine with their beer and tobacco all the recognized benefits and securities of the strictest Denominational education.

It was impossible to dilate for ever on the advantages of a Society united by tests and articles of faith; and Mr. LEATHAM's eloquence after a time began to expatiate in wider ranges of political speculation. The despondency which must have oppressed him after the election, and during three-fourths of the Session, had happily been relieved by the spectacle of one or two Ministerial blunders, and more completely by the return of Mr. GLADSTONE to the scene of his former triumphs. Mr. LEATHAM has made the strange discovery that the members of the Cabinet are, unlike the Huddersfield Liberal Club, not exactly of the same opinion on all points; and he sanguinely hopes for a disruption which would inevitably occur if every Conservative leader were positively determined to have his own way in all things. Mr. LEATHAM's theory that the more extreme views of a political party have a constant tendency to prevail is not supported by modern experience. Sir ROBERT PEEL was not an ultra-Tory when he governed at his discretion his own party and the House of Commons, nor was Lord PALMERSTON during his long enjoyment of power and popularity a revolutionary democrat. Mr. GLADSTONE's history affords a converse or negative illustration of the proposition that the people of England favour compromise and moderation. In 1865 he inherited from Lord PALMERSTON a Liberal majority of seventy or eighty, and in 1866 he forced the Liberal Ministry to resign. In the Parliament of 1868 a majority of double the former number enabled Mr. GLADSTONE to pass several great measures, and encouraged him to threaten half the institutions of the country. The consequence was the reaction which Mr. LEATHAM at the same time deplores and extenuates, after contributing to provoke it by every means in his power. In his speech he dwelt at some length on a fancied analogy between the Liberal party and a Dutch clock unnecessarily taken to pieces. The English nation cares but secondarily for the errors or mishaps of any particular faction, but it has a profound objection to see the works of its own Constitution subjected to incessant examination and repair. Prudent statesmen, of the class which generally controls the policy of a Cabinet, are perfectly aware that it is not for their interest to create annoyance either by precipitate progress or by unpopular retrogression. The inconvenience which results from attempts to redeem in office pledges imprudently given in Opposition is at its highest point immediately after a change of Government. Before next Session the former censors of the late Administration will have ceased to believe that the fleet for which they are now themselves responsible is a mere phantom.

Having ostentatiously spread his nets in sight of the Conservative fowl which he hoped to capture, Mr. LEATHAM turned to his second ground for consolation in the supposed reunion of the Liberal party. It seems that at the end of the Session “there was a heartier feeling and a warmer loyalty to the chiefs than it had been his (Mr. LEATHAM's) good fortune to witness for many a long day.” It is certainly not to the discredit of any member of the Liberal party that he should retain his loyalty to the gifted leader whose temporary absence proved his superiority to the numerous candidates for the succession. “There are,” said Mr. LEATHAM, “thirty millions of people in this country; but, as far as we know, only one GLADSTONE.” A less zealous partisan might perhaps pause to reflect why pre-eminent ability and unequalled reputation have failed to secure or have lost the confidence of the country, of Parliament, and even of the Liberal party. Mr. LEATHAM's recollection of the late relations between Mr. GLADSTONE and his followers is singularly inaccurate. Mr. GLADSTONE after his return to the House of Commons first spoke against the Scotch Church Bill, which was approved by a large majority both of Scotch and English members. He next delivered a powerful argument against the Public Worship Bill, ending with a notice of Amendments which he afterwards

prudently withdrew in deference to the almost unanimous determination of the House of Commons. Mr. GLADSTONE was again defeated by Sir W. HARCOURT on the question of the appeal to the Archbishops, although the Government supported his motion for reconsidering the question. Finally he with difficulty induced the House of Commons to accept the Amendments of the Lords. Mr. LEATHAM has a perfect right to contend that on all these points Mr. GLADSTONE was in the right, and the party in the wrong; but the defeat of a great political leader by his own followers is scarcely a proof of internal harmony. It is true that on some of the clauses of the Endowed Schools Bill Mr. GLADSTONE expressed the unanimous opinion of the Liberal party; but many of the number voted for the non-renewal of the appointment of the Commissioners who were warmly supported by Mr. GLADSTONE.

Mr. LEATHAM has probably affixed the right interpretation to ambiguous phrases which he supposes to indicate Mr. GLADSTONE's approaching conversion to the principle of disestablishment. The anticipation that a statesman will hereafter adopt doctrines opposed to all the professions and practice of his life is not perhaps a complimentary reason for confidence in his consistency and judgment. Mr. LEATHAM, in common with many other critics, understands Mr. GLADSTONE's declaration that he is "not an idolater of 'Establishments'" as an intimation that he intends to commence an attack on the English Church. Mr. GLADSTONE thinks once, and twice, and thrice in rapid succession; and it is highly probable that he may be converted to disestablishment as suddenly as he was converted to universal suffrage. Mr. LEATHAM, as an irreconcilable and impatient enemy of the Church, naturally welcomes his expected ally; but for his own purposes he might more prudently wait until Mr. GLADSTONE has finally entered on a policy of revolution. When the Swedish chiefs were negotiating with WALLENSTEIN, they were not in a hurry to publish the news of his intended defection. A proposal for disestablishing the Church would undoubtedly stimulate the Dissenters and ultra-Liberals to activity; but there is little use in appealing to a section of the party which did its best and worst for Mr. GLADSTONE at the general election. The seceders and neutrals who produced the reaction were discontented with the Government, not for its moderation, but for its restlessness; and their number would have been largely swelled if the Ministry had then identified itself with the cause of disestablishment. Only a few months before, Mr. GLADSTONE had, in answer to Mr. MIALI, made a powerful speech in defence of the Established Church; and, although a member of his family was afterwards allowed to throw a retrospective doubt on his sincerity, it was but reasonable and courteous to suppose that his opinions were worth one year's purchase. According to Mr. LEATHAM, "no one knows better than Mr. GLADSTONE that Parliament, now that it has got its 'teeth into the Church, will, to use a homely simile, make 'them meet.'" The inference that Mr. GLADSTONE will abandon the principles which Mr. LEATHAM regards as unpopular may perhaps be well founded. The friends of the Church will do well to learn a lesson from an implacable adversary, when it is proposed to fix the teeth of Parliament in doctrine as well as in discipline.

FARM-LABOURERS AND THEIR FRIENDS.

THE busy friends of the farm-labourer have lately transferred their attention from Suffolk to Wiltshire. No subject of discussion can be more unprofitable, except for merely theoretical purposes, than the price of labour or of any other commodity. It is true that, as a rule, farmers have not regulated the rate of wages with strict regard to demand and supply, but it is not to be assumed that because they have been influenced by custom or by good nature they will listen to the remonstrances of benevolent strangers. The Suffolk farmers were at the beginning of their late struggle exposed to much vituperation because they objected to the interference of the Unions between themselves and their labourers. It was, in truth, unreasonable that they should dispute the right of combination with all the conditions which it involves. In the end the farmers proved themselves so far in the right that they were able to carry their point. The managers of the Union boast that their numbers are undiminished, but they were compelled to confess that their funds were exhausted. The results of careful inquiry diminished the compassion which

had been felt for labourers in the Eastern Counties. Dwellers in towns have learnt that weekly wages are not the whole income of rural workmen, and that farmers have not been in the habit of calculating profits closely. It also appeared that the agitators had miscalculated the supply of labour. The farmers had little difficulty in finding additional hands, and they could in many cases diminish their own wants by retrenching superfluous work. The unusual dryness of the summer gave the employers an accidental advantage; but in any case their victory would have been inevitable. It is not improbable that emigration may ultimately have the effect of raising wages at home; but it is not a remedy which can be applied either gratuitously or on a sudden. It was easier for the Union to maintain at home the men who were locked out than to provide them with the means of settling in Canada. As soon as it was ascertained that the harvest would be got in without difficulty, the Council of the Union had the good sense to inform their clients that the contest must for the present be abandoned. The farmers will gain more than the labourers from the lesson which has been taught.

Mr. FAWCETT, in calling attention to a partial reduction of wages in Wiltshire, seems to have been influenced rather by local sympathy than by economic reasons. In some of his later letters he has, perhaps unconsciously, adopted the apologetic tone of a disputant who doubts whether he has been prudent in beginning a controversy. It is not even certain that his interference may not have tended to accelerate the reduction of wages or to make it general through the county. Several newspaper correspondents at first disputed the accuracy of his statement; but it now seems certain that some farmers have reduced their wages by a shilling a week; and perhaps their example might in any case have been gradually followed by their neighbours. As a Wiltshire man, Mr. FAWCETT regrets the loss inflicted on one class, and the diminished prosperity of the remainder, which is indicated by the reduction. If he had witnessed the same incidents in a district where he might have been a stranger, he would perhaps not have been tempted to question the law of the market. In his first letter he complained rather as a philanthropist than as an economic reasoner that wages should have been reduced on the supposed pretext that bread was unusually cheap. Having probably had time to reflect that labourers could not be had for eleven shillings if they were worth twelve shillings in the market, he abandons the moral ground of objection to the reduced rate, and endeavours to convince the farmers that they misapprehend their own interest. It is undoubtedly true that a reduction of wages is likely to cause permanent discontent; but unless the price of labour is to be permanently fixed, it must be liable to diminution as well as to increase. A farmer cannot be expected in one year to concede an advance because corn is dear or because labour is scarce, and in another year, when the circumstances are reversed, to think exclusively of his future relations with his dependents, whose good will Mr. FAWCETT advises him to conciliate at the cost of an immediate pecuniary sacrifice. The voluntary addition of a percentage to the market rate of wages would perhaps not be adequately appreciated by the objects of his generosity.

In looking to the spread of education as the most effectual mode of improving the condition of the agricultural labourer, Mr. FAWCETT virtually concedes the question in dispute. The Wiltshire farmers are concerned with the men actually in their employment, and not with a future generation. It is perhaps true that an intelligent and educated man may make better bargains for himself than an untaught rustic, but he will not be able to secure for his labour or for any other commodity an artificial value. When HUGH MILLER thirty or forty years ago worked as a miner in Scotland, he was incomparably superior in knowledge and intelligence to a Wiltshire labourer of the present day, and he received lower wages. In that time and country skilled artisans were accustomed to live on oatmeal porridge, and the rate of wages even for the best of their class was regulated accordingly. The Wiltshire employers appear to have taken into consideration, or to have urged as an excuse, the low price of flour, which is the most important article of cottage consumption; but the real motive for reducing wages has been apparently the late diminution of their own profits. The grain crops, with the exception of wheat, have not been satisfactory; and, principally in consequence of the scarcity

of hay and green crops, the price of stock has fallen heavily. In requiring their workmen to share in their own comparative adversity, the employers may perhaps fail to conform to the strictest economic principles, but they apply a rule which has of late years been generally accepted in other departments of industry. The price of food, which affects all classes of workmen equally, ought assuredly not to determine the rate of wages. When bread was permanently cheapened by the abolition of the Corn Laws, wages rose instead of falling, because the general prosperity caused an additional demand for labour. In recent times workmen, aided by the organization of Trade Unions, have claimed to share in the profits of their employers when trade has been brisk, and they have submitted more or less unwillingly to a corresponding reduction in seasons of adversity. Within the present year colliers and iron-workers have allowed a large percentage of reduction on their former rates of wages.

Advice which might be sound and serviceable if it were privately tendered is sometimes less advantageous in the form of a public remonstrance, because, amongst other reasons, it is overheard by the other party. Mr. FAWCETT may perhaps have been right in holding that it would be better for the Wiltshire farmers to pay something over the market rate of wages than to furnish an excuse for the organization of Unions in their county. When he writes a letter to the *Times*, instead of talking confidentially with a friend, he both suggests a menace which would be deprecated by the farmers, if not by himself, and seems to imply that conduct which at the worst amounts to mistaken calculation is morally culpable. It is too late to contend that the relations of employers and workmen should not be made the subject of public discussion; but controversy involves generalization, and tends to a uniformity of results which is not always conveniently applicable to agricultural economy. In no other industry of equal magnitude is there the same diversity of circumstances and of the capacity and efficiency of workmen. When a Labourers' Union succeeds in imposing on employers a minimum rate of wages, it will often at the same time both have established a maximum and imposed a limitation on the numbers employed. In some parts of the country disputes about wages have induced farmers to introduce as far as possible the practice of piece-work, to the advantage both of themselves and of the ablest workmen, but to the manifest detriment of the aged and the comparatively infirm. One of the anomalies of literary controversy on the concerns of farmers and labourers is that it is necessarily one-sided. Nobody writes letters to the *Times* to prove that the labourers in any parish or county have neglected their work or made unreasonable demands. No such statement would reach the ears of those who were criticized; and the philanthropists who undertake a disinterested supervision of rural affairs sympathize with the farmer only when he may be supposed to have a quarrel with the landlord about ground gone or unexhausted improvements. It is perfectly natural that all persons except those who happen to be the paymasters should wish the agricultural labourer to receive the largest possible wages.

THE SOCIAL SCIENCE CONGRESS.

IT is to be supposed that the Social Science Congress supplies a real want, and serves a useful purpose of some sort, or it could not have gone on for so many years and excited so much interest in a considerable number of persons. For some years the want it supplied and the purpose it served were disguised by the quaint inaptness of its name and by the natural uncertainty of its supporters as to what it was that they were doing. Gradually, however, what was obscure has become comparatively clear, and the President of this year, Lord ROSEBURY, has perhaps been more happy than most of his predecessors in the appropriateness of his discourse, because he has had the good fortune to come late in the list, and his path was more plainly marked out for him. The range of social subjects is not very easy to define, and it is to a large degree marked off by an accidental line from those subjects which are called political because they furnish political parties with topics for discord. But practically we all have a fairly correct notion of what social subjects mean. They are the things into which the rich are led to dive when they seek to interest themselves in the condition of the poor. An interest

of this kind is one which education and kindly feeling and a sense of religious duty have spread rapidly in the last twenty years among many Englishmen who, as compared with the poor, may be called rich. As party politics have decreased in interest, and there is a general consent that any respectable Ministry will do very well as long as it follows out a policy of moderate Liberalism, the interest in subjects bearing on the health, education, morals, and prospects of the mass of the people becomes stronger. A young man like Lord ROSEBURY who is intelligent and honest and wants to do good in his generation finds himself forced to make himself acquainted with some of the problems which the contemplation of modern society suggests. But he finds that they are very big subjects, full of difficulties, illustrated by scanty facts, and distorted by conflicting theories. To talk them over, to see whether others can contribute any new facts or true views, to meet perhaps some one with special knowledge who can give exactly the information wanted at the moment—even to catch sight of other people all ready to do something for society, if they did but know what to do—is cheering, strengthening, and stimulating. If there is such a thing as Social Science, it is certainly not in the slightest degree helped or retarded by these Congresses. But Social Science is a coy nymph, and those who believe in her existence enough to seek her with the requisite energy and depth of thought and research are necessarily few. What is incontestable is that there are very many educated, zealous, well-to-do persons who want to do good, but feel that the old methods of direct benefaction are inadequate or worthless, and who, directly they try to strike into a better path, feel puzzled and bewildered. They can at least, however, meet every now and then, and have a talk and keep up each other's spirits, and perhaps tell each other something that has struck them which may not be altogether a mistake, or impart some collection of statistics that may not be altogether baseless or irrelevant. The Social Science Congress is, in fact, a gathering for a friendly chat of puzzled persons, longing to do good under difficult circumstances.

There could not be a better embodiment than Lord ROSEBURY of all that is required in the President of such a Congress. He is young, he is ardent, he is thoughtful, he is moderate, and he thoroughly understands that he is not likely to set the world straight in the twinkling of an eye. Interested in many social questions, what he had to offer was the expression of this interest. He thought most justly that what the meeting could do was to stimulate the sympathy and what he termed the electric current of feeling among its members. He had thought over many of the most obvious problems that occurred to him, and he submitted his thoughts to his hearers, not as contributions to new theories, but as appeals to existing feelings. He went over familiar ground; the necessity for compulsory education, the advantages of technical instruction, the power of combination among masses of purchasers or labourers, the conditions under which workmen can be better housed, the success of clubs formed for the amusement and instruction of the poor. He had taken the trouble to get up a wide range of facts, and could speak of what is going on in France, Germany, and the United States, as well as what is going on in England and Scotland. He made it clear that what is being done for the poor and by the poor is, if taken as a whole, by no means a small thing. Mankind is working in a new direction, and many experiments have to be tried before it can be ascertained in what precise line future efforts are to be made. But it would be a great mistake to think or speak slightly of what has already been done. Germany has, for more than half a century, been perfecting a system of education which is so vastly superior to anything in England that she has at last done us the enormous service of forcing on us the conviction that we must either imitate or succumb to her. What purchasers of the humbler class can do by combination is illustrated by the Granges in America, which throw our modest Co-operative Societies into the shade. The Grange of California has its own ships, exports its own produce, and imports at a reduction of 50 per cent. the foreign goods of which it has need. Some at least of the associations which have been formed to supply artisans with decent dwellings have been pecuniarily successful, and perhaps the most successful has been one in which a community has been settled in block with its own laws and regulations, and with a total exclusion of public-houses. Clubs, as a rule, have not thriven, for the reason that, if

everything was done for the poor, and the clubs were founded and managed by the rich, they did not offer what the poor wanted, while the poor themselves were too uneducated to support them. As Sir WILFRID LAWSON lately remarked, the public-house beats the club if the club is a weakly one in a backward district; but there are instances of conspicuous success, and Scotland may perhaps boast of the most illustrious example, as at Dundee there is a club with a thousand members who have attained that acme of civilization revealed by their combining a love for beer in moderation with a passionate fondness for blue-books. Lord ROSEBURY remarks that the records of such things read like the records of great victories, and it is not surprising that those who record such victories should, like Lord ROSEBURY, dwell on them with enthusiasm, and bring them to the notice of puzzled brethren in the search after the path of useful effort.

Partly, perhaps, out of compliment to Lord BROUGHAM, who was the founder of these Congresses, a special importance has always been attached to those discussions of the Congress which bear on law and legal subjects. Over this department of the labours or pleasures of the Congress Lord MONCREIFF has been appointed this year to preside; and he thoroughly appreciated and heartily adopted the character which Lord ROSEBURY had striven to give to the proceedings. He did not affect to talk scientifically; he did not even affect to talk practically. He had, as so able a man was sure to have, some desultory thoughts about law and law reform which had occurred to him, but he could not say that he was convinced of their truth or prepared to advocate them, or to let any one quote his authority for adopting them. If, however, it was understood that they were all doing nothing more than having a friendly chat, he should be very happy to chat about law in a friendly way. There is nothing in the least absurd in this. Every one present would have liked to hear Lord MONCREIFF talk about law or anything else at a dinner-table, and would have thought what he said very well worth considering, although no one would have deemed Lord MONCREIFF pledged to what he chose to say, or bound to speak as accurately and exhaustively as if he were deciding in court a judicial question. The meeting of the Social Science Congress is like a long dinner party, where those present are not only permitted, but expected, to talk what is technically known as "shop;" only that the members for the sake of convenience eat at one hour, and listen at another. We do not know that any of these pleasant dinner-table remarks of Lord MONCREIFF about Scotch or English law call for much critical observation. At a dinner-table it is much more important who makes a remark, and how it is made, than whether it is in itself very true or new. That English law has partly gained and partly lost by its severance from the general mass of European law is true rather than new as a remark; but any one to whom the remark was perfectly familiar would like to hear Lord MONCREIFF make it, and make it well. If any part of Lord MONCREIFF's speech is to be singled out for comment, it may possibly be that which referred to the formation of a Code. His view was that nothing but a Code could assimilate Scotch and English law, or could really harmonize Common Law and Equity, but that a Code was hopeless because it could never be got through Committee. A nation which knows what it wants, but cannot contrive to realize it because a particular Bill could never be got through Committee, is certainly not ripe for a Code, and certainly does not deserve to have one. Still Lord MONCREIFF did not like exactly to say that nothing should be done towards a Code. At any rate he could make a suggestion good enough for a dinner party. Let some portion of law be selected as to which there is little doubt or controversy, which does not present any of the real difficulties of a Code, and in which no one will feel any particular interest, so that little criticism or opposition would be excited, and then let any two or more members of the Social Science Congress codify it, all alone, gratis, and for their own amusement, without any bother of paid draughtsmen and Government support, and Committees—and then—why then a step, not a very long step, but still a step, towards a Code would have been taken. There is a quiet fun about the suggestion which is not unworthy of a Scotch conversationalist of the highest rank.

MR. DISRAELI AND IRELAND.

IT has been announced, apparently under authority, that Mr. DISRAELI's intended visit to Ireland has been indefinitely postponed. His medical advisers, we are told, are of opinion that "it would be dangerous for him to go to Ireland at all, or, if he were there, to carry out the "purpose of his visit"—that is, to make speeches. Everybody will of course sympathize with Mr. DISRAELI on the indisposition which has led to this advice being given; but there are many reasons why the decision in itself should be a subject for congratulation. Mr. DISRAELI's political advisers, if he has any, or if he condescends to consult them, would probably join very strongly in the prudent counsel of his medical men. It is possible that we may have lost what the *Times* finely calls a "splendid addition to the present autumn's extra-Parliamentary utterances"; and if the oratory of statesmanship were merely a form of aesthetic enjoyment, it might perhaps have been well that Irishmen should have had an opportunity of listening to the PREMIER's eloquence. It may be doubted, however, whether his audiences would have been content to accept his speeches in this simple form. They would certainly have endeavoured to extract a political meaning from his utterances, and it would have been scarcely possible, under such circumstances, for the most cunning master of words to open his lips without either giving unnecessary offence or exciting dangerous expectations. The speculations of the *Times* as to the probable results of this visit if it had taken place are a melancholy illustration of the want of respect for the intelligence of Irishmen which is too often shown in the remedies which are suggested for their discontent. Irish disaffection, we are assured, is absolutely without real foundation, and "ought to yield to proper treatment," which, it seems, is to consist in pretty talk. It is obvious, however, that if the disaffection is unfounded, that must mean that everything has been done for Ireland that can justly be expected, and that she has nothing more to look for from the British Government. However true this may be in itself, it is difficult to conceive how any reasonable creature could for a moment imagine that Mr. DISRAELI's going over to Ireland to say this to the people would be likely to throw them into an ecstasy of delight, and to "cement anew the ancient and deep-rooted brotherhood between the English and the Irish." A distinct announcement that no further concessions can be made would naturally be regarded rather as a challenge to war than as a pledge of friendship; and, on the other hand, any indistinctness on this point which left room for an impression or hope that Mr. DISRAELI had still something left in his bag for Ireland could not fail to produce incalculable mischief. Yet one or other of these things Mr. DISRAELI must have said, or allowed himself to be supposed to say, if he spoke at all. Anybody who knows anything of Ireland, and of the political forces and aspirations which are at present at work there, and the sort of people who are directing them, must be perfectly aware that Irishmen are not at all likely to be contented with empty words about their being "an integral portion of the same nation as their English brethren," with "a common history and common interests." Mr. DISRAELI can have been under no apprehension of an unpleasant reception, for the Irish, whatever their weaknesses or faults, are always generous in their hospitality. The mischief of the visit would have lurked in the impression which would have been formed, on the one side or the other, of the disposition of the Government to make further concessions to what are called Irish ideas.

There is a very wise remark in one of Lord PALMERSTON's letters which have just been published in regard to the relations of England and the United States, which applies equally to the relations of the British Government to Ireland. "It is not," he said, "concession on this matter or on that which is of national importance; it is the habit of making concessions, and creating a belief that you will make them, that is fatal to a nation's interest, tranquility, and honour." Unfortunately this belief is the lesson which has been sedulously and continuously taught to the people of Ireland during successive generations. It may be said that the various concessions which have been made were wise and beneficial in themselves; but there can be very little doubt of the fact that a deeply rooted conviction has been left in the mind of the people, and artfully cultivated by those who desire to use them for other purposes, that nothing has been given except through fear, and that

fresh demands have only to be made with sufficient loudness to be conceded in time. And there can be equally little doubt that this feeling, by distracting attention from real benefits and the means of substantial prosperity, and by keeping up a perpetual state of unrest and desire, is the source of much of the unhappiness of Ireland, and of the difficult relations which continue to subsist between her and the rest of the Empire. What Ireland above all wants is repose and leisure to attend to her own everyday affairs. She has hitherto been like some unfortunate invalid whose malady has been rather doctors than disease. There has been perpetually some grave man sitting by her couch, feeling her pulse, tapping her all over, reporting all manner of alarming symptoms, and prescribing every variety of cure. She has been, as it were, the common resort of ambitious physicians in search of a sensational experiment. Young and ardent beginners have tried to make a reputation by attacking the case, while more mature practitioners have endeavoured to recover a fading name by the discovery, if not the cure, of a fresh crop of disorders in an unfauling subject. It is certainly not surprising that, under such treatment, the unlucky patient should have yielded to hypochondriacal delusions. Ireland, in short, has had too many doctors and too much physic; and common humanity as well as prudence would suggest that it would now be well to let her alone for a while and see what will come of the *vis medicatrix nature*. It is obvious that, under these circumstances, nothing could be more cruel or wanton than for an English statesman to go out of his way to renew the old system of probing and plastering. However benevolent his motives, or however great his skill, he would be certain to disturb the operation of the more wholesome restoratives of peace and quietness.

It is no doubt highly desirable that Irishmen should be made to comprehend that they stand on the same footing as Englishmen as the citizens of one common Empire, but this does not happen to be what the discontented people in Ireland want. In fact, they have it already. What they are seeking is to be placed on the footing of inhabitants, not of a common Empire, but of an independent State. They ask that a majority of Irishmen should be allowed to govern Ireland in their own way, without reference to the opinions and interests of the people of Great Britain. It is unnecessary to repeat the familiar reasons why such an arrangement is inadmissible, but it is unfortunate that a part at least of the population of Ireland should as yet have failed to appreciate them. It does not follow, however, that it is either expedient or in good taste that a Minister should go over to Ireland for the purpose of thrusting these reasons in the face of the people. It is enough that demands which affect the integrity of the Empire should be set aside with dignity and decision when they are formally presented in Parliament. Mr. DISRAELI is no doubt a very clever man, and has probably great faith in his own eloquence, but it is impossible that, if he had spoken, he could have avoided or ignored this subject, and it is equally impossible that he could have said anything without either giving countenance to the movement or needlessly exasperating its supporters. There was an obvious significance in the delight of such journals as the *Nation* and the *Irishman* at the prospect of drawing the head of the Government into the toils which were spread for him. It was, no doubt, hoped that a sense of civility would prevent the visitor from speaking too strongly in opposition to a popular cry, and that his utterances might be twisted into pledges which would encourage the hopes of Home Rulers in the meantime, and intensify the anger with which their subsequent repudiation would be received. The idea that Mr. DISRAELI has only to run over to Dublin or Belfast to make one or two smart speeches is a curious example of the sort of superstition with which some people believe in the power of public speaking. Recent experience might have been expected to convey a useful warning against implicit confidence in the magical efficacy of messages of peace. The thorough contentment of Ireland must necessarily be a slow, tedious, and fluctuating process, and can be accomplished only by the gradual operation of wise and firm administration and advancing education. On the whole, it is impossible not to feel that Mr. DISRAELI's cold has been the means of preventing a very rash and wanton experiment.

TITLE LOCAL GOVERNMENT BOARD REPORT.

BY a singular and inconvenient arrangement, the Report of the Local Government Board and the Report of the Medical Officer of the Local Government Board are not printed in the same volume. The department reports generally on the administration of the laws relating to the public health, and refers the reader for further particulars to the Report of Mr. SIMON. There are obvious disadvantages attending this practice of double reporting. When a Parliamentary department says that so and so has been done or left undone, we know with whom we have to deal. There is a responsible Minister who can be questioned and, if need be, censured in Parliament. The Medical Officer, on the other hand, is only a subordinate of the Local Government Board, and it is impossible to say with any certainty how far his views represent those of his superiors, or are merely suggestions thrown out for their consideration. It is very desirable to have Mr. SIMON's views upon the matters which have come under his cognizance during the year, but it is equally desirable to have the views of all the Local Government Board Inspectors upon the sanitary history of their districts. We are not sure that at present one does not crowd out the other. Mr. SIMON publishes a kind of intermediate Report founded apparently on Reports of the Medical Inspectors, and this is pretty much all the information given to the public on the most important side of the Local Government Board's work. Even this, as has been said, has to be looked for in a separate Parliamentary paper. That Mr. SIMON's Report appears in its present form is not the fault of the department. The Public Health Act of 1858 directs that it shall be laid before Parliament, and a provision which was very appropriate when the Medical Officer of the Privy Council was the only sanitary authority remains unaltered now that he is merely one of a large staff of authorities having charge of a great department of State. But the omission to print or reprint his Report in the same volume with the general Report is one which it is in the power of the department to supply in future issues.

This is not the only fault we have to find with these Reports taken together. When the Local Government Board assumed the supervision of the sanitary administration of the kingdom, it might have been expected that its annual Reports would constitute a comprehensive review of the sanitary work done or still remaining to be done. The Inspectors who work under the Education Department present a report on the general progress of educational work in their districts, besides those tabular and other statements which acquaint the department with the condition of each separate school inspected. It is true that these Reports are now so numerous that only a selection from them can be printed; but a sufficient sample of them is communicated to the public to show the nature of the information obtained, and for the rest it is enough to know that the department learns all that each of its officers has to tell about the matters which it is his business to investigate. Nothing of this kind is to be found in the Report of the Local Government Board. Its Inspectors are much fewer than those of the Education Department, so that there would have been no difficulty as regards room in printing the general Report of every Inspector. It is to be presumed that such a Report is made, and that each Inspector annually reviews for the information of his chiefs the sanitary work done in his district; but, if so, why are not these reviews made public? It is quite intelligible that the particular work in which the Inspectors have been engaged should be kept private. The quarrels they have had with this or that sanitary authority could hardly be printed without giving more offence than it would be worth while to cause for such an object. But it would be quite possible to print so much of their Reports as would enable the public to form their own conclusions as to the success of the Public Health Act without entering into these details. As it is, we know little more than that so many Medical Officers of Health and so many Inspectors of Nuisances have been appointed, and that so much money has been borrowed for sanitary purposes. If the Annual Report contained a Report from each of the Inspectors and from any of the medical experts whose inquiries possessed more than local interest, great help would be given to the creation of an intelligent body of opinion on sanitary questions. At present we know that the work of preventing disease is entrusted to many hundreds of local bodies, varying from a wise and energetic municipality to an obstructive Board of Guardians or a London Vestry. There

is nothing in this fact to inspire confidence or even hope, unless we can know at the same time in what temper these authorities have taken up their new duties, and what degree of activity they are bringing to the discharge of them. This is precisely the information which the Inspectors of the Local Government Board are able to supply. They pass a great part of their time in conferring with these local authorities on sanitary matters; they know the difficulties they have to contend with, and the zeal or supineness which they display in contending with them; they know what is actually being done in the direction of sanitary reform, and how far what is being done is likely to prove adequate in itself or to lead to something adequate in future. No doubt their experience upon these points is laid before the Local Government Board, but in the interest of sanitary progress it is important that it should be laid before Parliament as well. The Local Government Board has, and must long continue to have, a very hard part to play. If it were to make frequent use of the powers entrusted to it, the object in view would probably be rather hindered than furthered. So much local irritation would be engendered that sanitary grievances would soon come to mean the complaints of those who are made to be well, instead of, as now, the complaints of those who are left to be ill. It is needful therefore that the Board should move with great caution, and it is also needful that it should not do violence to local opinion except when it is supported by general opinion. The diffusion of sanitary information is the one means by which this general opinion can be built up. If the Local Government Board desires to be supported in its conflict with obstinate sanitary authorities, its first business is to let the public understand what these sanitary authorities are about. There is no way of doing this so natural and so effective as the publication of the Reports of its Inspectors.

Until this publication takes place we must remain in ignorance whether the sanitary authorities are merely doing what they must, or setting themselves vigorously to do what they may. If the former is the true account of the matter, then a good deal more will be needed in the way of legislation. It is not enough for a Board of Guardians or a Town Council to send their Medical Officer of Health or their Inspector of Nuisances to report upon special outbreaks of disease, or to examine some notoriously overcrowded court or some unusually offensive pigsty. The division of the whole country into sanitary areas ought to lead to the publication of something like a sanitary map of England and Wales. The newly created sanitary authorities ought to have instituted in the first instance—ought, if they have not done so, to be directed by Parliament to institute now—a complete sanitary review of the districts committed to them. They ought to know, and to let the public know, in what way their district is drained, from what source it is supplied with water, of what quality the water is, how many houses are defective in proper sanitary appliances, what steps are being taken to prevent new houses of a similar kind being built and to compel the owners of existing houses to put them into better order, what nuisances in the way of noxious trades or manufactures exist in the neighbourhood, and how far the evils arising from them are in course of being remedied. If these questions could be answered about every town and village throughout England, we should have all the facts which for sanitary purposes it is important to get at. The machinery for furnishing this information already exists. There is not an acre of ground in the country for the health of which some local authority is not responsible, and this local authority can, if it chooses, enlighten itself upon every one of these points without needing any powers which it does not already possess. For anything that is positively known to the contrary, this kind of inspection may be going on now. If it is not going on, and if the local authorities are for the most part unwilling to set it on foot, it would not be difficult to frame a short Act of Parliament which should compel them to lodge the required results with the Local Government Board before a certain date, on pain, in case of default, of having to see the inquiries made for them by the officers of the central authority. Until the Local Government Board lays aside its reticence and allows its Inspectors to tell the public plainly what the local sanitary authorities are doing, there is no means of ascertaining how far legislation of this kind is really needed.

THE PRINCE OF WALES'S INCOME.

IT is impossible to suppose that the explanation of the *Times* with reference to the pecuniary affairs of the PRINCE of WALES was published without authority, but it may be doubted whether it was wise that it should be published at all, at least in the shape in which it has just been presented. It is said that it is necessary to give a denial to certain statements because, if they are not contradicted, they may be supposed to be admitted to be true. It seems to us that this is establishing an extremely inconvenient and dangerous precedent. It is one of the penalties of the PRINCE's rank that people should amuse themselves by gossiping about him, and discussing what they imagine to be the state of his private affairs; but the penalty would be intolerable if he were required to take notice of every idle and impertinent story about himself which might happen to get into circulation. In any case, if it is necessary that a contradiction or explanation should be offered, it is at least desirable that the occasion which is chosen for making it should be consistent with the dignity of the person concerned. It has not hitherto been thought necessary that a gentleman should stoop to rectify the tattle of the servants' hall or the gossip of the streets. The sufficiency of the PRINCE of WALES's income is naturally a question of State, and it is right that it should be discussed; but the discussion should be based on an authoritative statement of the facts openly furnished by a responsible Minister. If it had been only a question of the present indebtedness of the PRINCE, an assurance that his means were sufficient to meet all claims upon him might have been enough; but the question is really of a much more serious character. It is stated that HIS ROYAL HIGHNESS is able to keep out of debt only by drawing upon his private capital to the amount of from ten to twenty thousand pounds annually, his regular income being every year exceeded to that extent by his expenditure. We are not told how long this process has been going on, or how long the PRINCE's capital may be expected to endure this drain upon it; but it is clear that, if his expenses are not diminished or his income increased, a time will come when the expedient which at present enables him to avoid an accumulation of debt will cease to be available. The question, therefore, arises what should be done to avert the catastrophe which is apparently approaching; and this is a question which, it seems to us, cannot be conveniently thrown open for loose popular discussion. It is difficult for ordinary people to estimate exactly what is the proper amount which is required in order to enable the Heir to the Throne to fulfil the duties of his rank without ostentation on the one hand or parsimony on the other; but this is a subject upon which the Ministers are bound to form an opinion; and, if they think that the PRINCE's present income is insufficient to meet the unexpected obligations which have been thrown upon him, it is their duty to suggest some means by which a grave public scandal may be avoided. It cannot be said that the country has neglected to provide for the expenses of the public representation of Royalty, and it is to be hoped that some arrangement may be devised by which this provision may be applied to the purpose for which it was intended.

WORRIES.

BY worries we mean evils in anticipation; those fears, vexations, irritations, and dangers which haunt the mind, unsettled and disturbed, out of its ordinary routine, though it is so far at ease in present circumstances, and has so little ground in positive fact for its forebodings, that it has to call in fancy to swell vague apprehension into shape and consistency. Misfortune is not a worry, nor yet is a well-grounded anxiety. Worries are possibly impending troubles and annoyances magnified into such large dimensions as not seldom to cause more uneasiness as mere creatures of the imagination than they would do if converted into fact. We know while we brood over them and dilate upon them that we ought to combat them, that we are exaggerating trifles into things of importance; we are conscious of a fevered fretful fancy, and that our fears are of the nature of phantoms. The real troubles of life, experience tells us, are facts equally patent in all times of the day, in all weathers, in every state of health. We may feel them more at one time than at another, but they never lose their character to the understanding. We are aware, on the contrary, that worry expands and dwindles. Awake at midnight, it is a terror, at noonday a bugbear to be smiled at, set aside, overcome; but not the less is its sway powerful at its own time and hour.

There is a mixture of conscience and cowardice in the character subject to worry. It terrifies us through our weaknesses by revealing a vista of uncongenial effort, of muddle that we cannot see our way through, of energies severely taxed. Always we are the actors unprepared for our part, unequal to it; but, however many are concerned, *ourselves* is the person on whom the pressure lies, on whom it devolves to disentangle intricacies, to reduce chaos into order, to reconcile contradictions. The mind subject to worries is not indolent; but it runs in a groove, expatiates in leisure, cannot rouse itself to prompt action, is very far from rejoicing at a sudden call upon its powers. And yet from these very causes—from its dread of *contrempe*, failure, incongruity, from its horror of confusion, from its recoil from risk, from its morbid pursuit of remote consequences, from an unnecessary and little appreciated sympathy with others in possible predicaments—it feels that itself is the one to step into the breach, to plan the rescue, to face and to avert the mischief; an innocent vanity, after all, which generally dies with the daylight. It is Hamlet's state of mind applied to social difficulties and the lesser miseries of life:—

The time is out of joint;—O cursed spite!
That ever I was born to set it right.

For the victim of worries is necessarily very unfit for the work which he thus officiously imposes on himself. How, asks the moralist, can we regulate events of which we know not whether they will ever happen? and why should we think with painful anxiety about that on which our thoughts can have no influence? Common sense will be no party in such consultations. The man who tackles and gets the better of difficulties when they do arise is of another temper altogether; he is one who waits for the occasion, wasting no ingenuity on imaginary situations, but quick to apprehend and arrange the facts of a case as they declare themselves. He does not fret and fume in perplexed anticipation through the hours of inaction, but, clear-headed, in calm self-reliance, addresses himself, not without complacency, to the task of reducing confusion to order, and setting the crooked straight. Whatever reflection he bestows will stand daylight and discussion. The other, the dreamer, listens, admires, acquiesces, and, if he is wise, keeps his unprofitable incubations to himself, thankful to have the question that has so painfully exercised him settled for him.

The step from being haunted by worries to worrying in turn is, however, almost inevitable. Whenever some occasion brings many persons together for a common object there is generally one of the company importunate in pressing his apprehensions on the general mind. The anxious worried member of a travelling party cannot help being troublesome to his associates by warnings out of season. He gives vent to his fears when fears are futile; he foresees that the luggage will be lost, the train missed, the hotel full, when nothing can be done to avert these calamities. His enemy comes between him and the fairest prospects, and he cannot help making others sharers in his own distraction, probably showing the least resource of any of the party when the thing he fears really happens. But, wherever worries are given way to, the worried person, whether it be in the cause of punctuality or foreseeing danger and possible inconvenience or accident, breaks up snugness, reminds his friends of cares and duties which all would willingly forget for a time, and spoils the pleasure which he is so solicitous to preserve from disturbance and mischance. This may be merely the instinct of teasing, but also it is the temptation of the nervous temper alive to possibilities, and feeling that nobody else is sufficiently awake to remote dangers.

The greater troubles of life are certainly independent of time and seasons. It is only in song that the young widow can complete the sum of her elderly husband's obliging qualities by adding that he died at precisely the most convenient time of year; but surely the pleasure-taking season is the season of worries. They characterize the turn of the year along with rooks, and partridges, and shooting-stars, which may be seen all the year round, but collect in flights, and run in coveys, and fall in showers in the autumn. The holiday months are the very hotbed of worries; nor need a person be peculiarly susceptible of worries to be tried by them at this season. It is their opportunity. Somebody must lie awake through the small hours in every family that is engaged in a scheme of change and enjoyment. Somebody must puzzle himself or herself to the verge of despondency in every house which expects a succession of guests; how to reconcile contending plans and claims, how to make the right people meet each other, and to keep the wrong people from falling in each other's way. However smoothly things may run, some one, we may be sure, has had an uneasy time. Serene and smiling as is the brow of our hostess, it has wrinkled but lately under a touch of mimic anguish, very like the real thing while it lasted, as she passed difficulties under review and saw shadows loom and grow portentous to a startled fancy. Worries flourish in holiday time because in fact they are the trials of prosperity. They drop into insignificance at the first touch, or even threat, of calamity and adversity. The heads of a sea-side party, worried to death with the various uneasinesses and inconveniences incident to this form of enjoyment, find them disappear into space at the mere alarm of sickness or the panic of a bathing accident. How coolly will a man take the disarranging of elaborately planned schemes of pleasure, or even some slight where his feelings are most sensitive, at the first suspicion of something wrong in his affairs; while he would have fumed, fretted, believed himself the victim of cruel fate, made everybody unhappy about him, if he had seen his fortune on the rise instead of going down. Unbroken felicity is incompatible with humanity; worries are the natural alloy of a prosperous career. They are the

recognition of the law of mutability. The difference is that happiness has small torments appropriate and peculiar to itself, which so often overcloud it to its owner that it is not recognized for what it is till that phase of it at least has passed away for ever. And certainly this is one of the compensations for downright calamity. Misfortune on a large scale sends worries packing, and people will sleep under a heavy loss who pass weary vigils under the pricks of small apprehensions; the mind under the shock feels suddenly loose and disengaged from a hundred petty annoyances. A strange sense of liberty floods the mind. So many things now don't seem which before were of such worrying importance.

After all that reason preaches and that moralists say, the apprehensive temperament can never wholly overcome its nature. All it can do is to keep it from betraying itself and becoming both a particular and general nuisance. Excellent rules are put forward on the subject, but we always find that the panacea comes from a physician who has no need to try his own remedy. Sir Joshua Reynolds, the calmest of men and the most indefatigable worker, laid it down that the secret of life consisted in never being overset by trifles; but worry never shows itself as a trifle, it seems important while its power holds. Isaac Walton, of ideal serenity, recommends angling as a calmer of unquiet thoughts, but to his readers he seems a man who never could have had an unquiet thought. Sydney Smith, enforcing cheerfulness, says that the habit of taking short views of human life is the secret. Melancholy (by which he clearly means worries) commonly lies to the future for its aliment, and must be encountered by diminishing the range of our view. I have a large family coming on, my income is diminishing, and I shall fall into pecuniary difficulties. Well, but you are not *now* in pecuniary difficulties. Here he is confusing legitimate anxieties with the shadow of them, which is our subject. The man will be wiser to reduce his expenditure than to shut his eyes, which is the advice given. These prescriptions all miss the idea of chase and capture which lies at the bottom of the word. I am haunted by spiritual hounds in the night season, writes the most desponding of poets. His pursuers were monsters indeed; but every genuine worry, even if it be but a young author's discovery, too late, of a critical misprint, shares the same nature. It dogs, fixes its fangs, cannot be shaken off, while it holds lasts. By figures alone, as something external, can the torment be expressed, as Charles Lamb, transferring his worries, will take the thorns out of his pillow and fling them at rich men's night-caps.

It may, however, be argued that since there is no such thing as human perfection, the world would get on but ill if there were no tempers a little on the side of morbid, and apt to fuss themselves to others. We see people indeed to whom nothing comes amiss, who take for granted that all will go right without their meddling, who live as though they had perfected themselves in the wise maxims we have referred to, who never anticipate trouble or are alarmed a moment too soon; but, however comfortable this may be to themselves, the lesson comes too naturally to them to engage our confidence or sympathy. Men are so much often immovably serene from apathy than from reflection that, if we cannot have the exact medium, we resign ourselves rather to the perturbations of a temper prematurely and unprofitably anxious, with a will to help and rectify beyond its resources, than to the passive endurance and calm helplessness which contentedly leaves the fets, entanglements, and unbusiness of social life to whoever is willing or forced to encounter them.

ALTHORP.

NORTHAMPTONSHIRE, almost the central county of England—an old writer describes the town of Northampton as situated "in ipso insule umbilico"—is without doubt one of the most respectable. We use the word in Miss Austen's sense, many of whose heroes and heroines are supplied with "parks" and "lodges" in this favoured county. Respectability, in the days of *Mansfield Park*, implied a comfortable country house, an income of at least two thousand a year, and a recognized position among all the visitable folk of the neighbourhood. People of this class have always abounded in the land of "squires and spires"; and no part of England is more thickly strewn with "respectable" mansions, or contains more great houses of real importance, such as Burghley, Milton, Rockingham, Drayton, Castle Ashby, and Althorp. It can hardly be said that Northamptonshire is an historical county. It has no history at all in the sense in which Yorkshire, Norfolk, and Devonshire have histories. Events have indeed happened within its borders; but they might almost as well have happened elsewhere, since they were not ruled by the geographical position of the county, or by peculiarities of race arising from that position. Such points of historical interest as do belong to Northamptonshire gather for the most part about these existing great houses, or the sites of such as have disappeared, like Fotheringhay or Northampton Castle. At Rockingham we remember Anselm. On the mound of Northampton, overlooking the river, we recall St. Thomas, and that famous scene in the King's hall which was followed by his flight from England. But although Rockingham and Northampton, each on the border of a great forest district, were for that reason much affected by Norman and Plantagenet kings, and thus became the scenes of some important gatherings, it is not until Tudor days that the group of houses which still make the chief glory of Northamptonshire becomes really conspicuous. At Burghley it is difficult to think of any one but the great Lord Treasurer who built it. Apethorpe equally recalls its

founder, Sir Walter Mildmay, Elizabeth's Chancellor of the Exchequer, who reproduced the quiet courts of his own dwelling in his College of Emmanuel at Cambridge. Holdenby and Kirby were, in their full splendour, the creations of Sir Christopher Hatton. The first had been his birthplace. Down the long gallery of the latter the "grave Lord Keeper led the brawls," after his Court fortunes had enabled him to buy the estate and to complete the half-built mansion. Boughton, with its stately avenues, was the home of the Lord Montague who sat in the hall at Fotheringhay at the trial of Queen Mary, of whom a very curious picture is preserved in the mansion. At Milton the tree is still shown under which Wolsey rested when, on his way to Leicester Abbey, he was entertained by the ancestor of the present owner. Castle Ashby, although a much older stronghold existed on the commanding site of the present house, was built by the first Lord Compton in the reign of Elizabeth; and Althorp—with which we are just now most concerned—came rather before that time into the hands of Sir John Spencer. Both Compton and Spencer were among those great sheep-owners whose flocks, according to Sir Thomas More, "consumed, destroyed, and devoured whole fields, houses, and cities."

For their masters. . . . inclose all into pastures; they throw down houses, they pluck down towns, and leave nothing standing but only the church, to be made a sheep-house." The wealth thus gathered was enormous; and the foundations of Castle Ashby and Althorp may be said—as local legends assert of certain bridges and churches—to have been "laid upon wool-packs."

Northamptonshire is not picturesque. Indeed the special respectability which belongs to it is hardly compatible with much hill and dale, and not at all with wild moors or heathy uplands. It is still, as Fuller described it, "an apple without core to be cut out or rind to be pared away." There is no waste ground within the county; and the forest which anciently covered so much of the surface must have disappeared at a very early period, since Camden found little wood except at the extreme limits of the county—about Rockingham and Yardley Chase, where it still lingers; and an old saying, "He that would eat a buttered fagot, let him go to Northampton," is explained by Fuller as implying that to be "the dearest town in England for fuel, where no coals can come by water, and little wood does grow on land." But the forest gave place to rich arable land; and the broad green pastures which follow the course of the Nen had always been attractive, since the most ancient settlements lie along the gentle rising ground that slopes upward from the river. The general level of the country, and the comparatively good roads which the level rendered possible, assisted the respectability of Northamptonshire. Squires' houses arose at convenient distances. The county lay at not more than a long day's journey from London; and in Elizabethan days, besides the open pastures which attracted the great sheep-owners, the air was regarded as unusually sweet and wholesome, owing, it was thought, to its distance from the sea, which a writer so late as 1738 observes, "doth not infect it with its noisome fumes." Throughout the last century planting went on largely in Northamptonshire; a great example having been set by Duke John, "the Planter," at Boughton, where far-stretching elm avenues are marked features of the landscape for miles about the house. The bareness of the land which followed the old sheep-farming and the clearing of the natural forest was thus gradually replaced by woods which have long since become venerable; and "he that would eat a buttered fagot" must now go elsewhere than to Northampton.

Of these wooded domains, recovered to something even more than the sylvan beauty of the primitive forest, Althorp is one of the most delightful. The deep woods that clothe the sides of the valley, the sunny lawns—the true old forest wood, still maintained in Northamptonshire—that open below and between them, dotted with deer, and overshadowed here and there by some stately oak or beech, "sentinels" of the closer ranks; the broad turf "walks" (again a forest term), and the air of repose and seclusion that rests on the whole scene, combine to produce an impression well in keeping with the associations of the place, and with the special treasures which the house contains. Ben Jonson, and the masque with which he greeted the Queen of James I. and Prince Henry, when, on their first journey from Scotland, they entered the domain of Althorp—

This is Cyparissus' face!
And the dame hath Syrinx grace!
O that Pan were now in place!
Sure they are of heavenly race;

Waller, and Sacharissa, who lies buried in the little church at the head of the park—

Ye lofty beeches! tell this matchless dame,
That if together ye fed all one flame,
It could not equalize the hundredth part
Of what her eyes have kindled in my heart;

and Edmund Spenser, whose *Fuery Queene* Gibbon exhorts the lords of Althorp to "consider as the most precious jewel of their coronet"—these are the names and memories which first occur to us as we look down from the higher ground on the somewhat ordinary mansion. "The nobility of the Spencers," in Gibbon's words, "has been illustrated and enriched by the trophies of Marlborough"; and there has been no lack of distinguished personages in their immediate line who have shone alike in camp and Court. Yet the associations of Althorp are hardly so much with public life as with "retired leisure," and with the calm delights of such a vast "Paradise of Bokes" as only the enthusiasm of a Dibdin could

fairly describe. More than fifty thousand volumes are arranged in the rooms assigned to them. The number alone probably exceeds that of any other private library in the world; but when the extreme rarity and the admirable condition of most of the books are considered, it may be added that very few public collections equal, or even approach, it in some of the most important departments.

Althorp is hardly an imposing mansion. Mrs. Jameson described it as having "a look of compactness and comfort without pretension," and perhaps this is the utmost that can be said for it. The house was cased with a whitish brick by the second Earl, the collector of the library; and of late years a building has been added which brings the great library more into keeping with the rest; but does not alter the general contour. Yet the house has really grown out of that built by Sir John Spencer, the great sheep-owner, early in the sixteenth century. It contains portions of this date, and successive owners have left their marks within and about it. The great staircase, and probably the picture-gallery, remain as they were planned by "Sacharissa," Dorothy Sidney, the wife and soon the widow of the first Spencer Earl of Sunderland, who fell at Newbury. In order to make them, she enclosed the inner court of the Tudor house. Her son, the second Earl, made further changes; and Evelyn, who was a great friend of the Countess, and who frequently visited Althorp, describes it as "a noble, uniform pile, in the shape of a half H. . . . The hall is well; the staircase excellent; the rooms of state, galleries, offices, and furniture, such as may become a great prince." This second Earl was the "unprincipled and faithless politician" who figures in Macaulay's History, constant through all the vicissitudes of his life to three objects only—to be safe, rich, and great. William visited him at Althorp in 1695; and "all Northamptonshire crowded to kiss the royal hand in that fine gallery which had been embellished by the pencil of Vandyck and made classical by the muse of Waller." The second Earl Spencer told Dr. Dibdin that he had talked with an old woman at Althorp who had a perfect recollection of this visit, and described the royal bodyguard as she saw them with their drawn swords, in the square before the house. This indeed is a tradition which Mr. Thoms would find no difficulty in accepting. It is only within the last twenty years that persons have passed away who had talked to those who had witnessed the landing of the "Deliverer," and his march inland from Tor Bay.

Pictures and portraits are scattered through all the rooms at Althorp; but the most important of the latter are assembled on the staircase—which is really "excellent"—and in the long gallery. Fronting each other, on the upper part of the staircase, are two very remarkable portraits, each a full length, of the beautiful Duchess of Devonshire, born a Spencer. One of these is by Reynolds, the other by Gainsborough. Such an opportunity of comparing the work of Sir Joshua with that of "the man in Cavendish Square" is rarely afforded. It is hard to say which portrait is the more graceful. We turn from one to the other, and after the fiftieth comparison are compelled to admit that both deserve the crown. Here we are more strictly within the domain of art. Passing into the great gallery we are in that of history as well, and are made at once to feel how closely the older houses of Northamptonshire have been associated with the general history of the country. Here is a long series of Spencers, beginning with Sir John of the sixteenth century—a stout, bluff-faced personage—who was the first owner of Althorp, and whose sheep, according to the local tradition, never numbered 20,000, though the flock constantly rose to 19,999. He is followed by the first baron, so created by James I. after the reception of the Queen and Prince at Althorp; his grandson, created Earl of Sunderland by Charles I., in whose cause he fell at the age of twenty-three in the battle of Newbury; the second Earl, dark and with a gloomy expression, painted at full length by Carlo Maratti, and also by Sir Peter Lely; the founder of the library, and the "Lord Althorp" of the first Reform Bill. These are among the most noticeable of the family portraits; unless we include with them Kneller's Duchess Sarah of Marlborough—young, beautiful, and haughty—or her husband, the great Duke, by some unknown artist, said however to have been the favourite portrait of the Duchess; who, having had her husband painted as the "handsomest fair man" in England, resolved that he should also appear as the "handsomest brown man"; and this picture accordingly represents him with a darker complexion than usual, and wearing a dark wig. But each lord of Althorp, active in public life, gathered about him the "presentments" of the great men of his time; and the gallery is in truth, as Walpole fantastically described it, "an enchanted scene, endeared by a thousand circumstances of history and art to the pensive spectator." No period of English history, from the time of Henry VIII. to our own day, is unrepresented. Elizabeth's great statesmen look out from their stiff panels. Vandyck's stately full-lengths seem ready to step forth from their canvases; and the beauties of Grammont languish along the walls in the most flowing *deshabille* of Sir Peter Lely. The famous Vandyck in which George Digby, second Earl of Bristol, and William Russell, afterwards the first Duke of Bedford, are represented together, is no doubt that to which Macaulay specially refers. It is one of the finest Vandycks in this country, and would alone be sufficient to make the reputation of any gallery; as this gallery would of itself sufficiently distinguish the house, did we not know that the chief treasures of Althorp are yet rarer and more costly.

To most of us the great "Spencerian" library, which Dibdin has described in so many tomes, and on which he has lavished

his most ecstatic epithets and his largest type, is scarcely a reality. It cannot in the nature of things be thrown open to the world after the fashion of a picture-gallery or a museum of natural history. Not many strangers pass through the rooms which contain it; and fewer still (unless under special circumstances) have had the privilege of holding in their own hands the famous *Decamerone* or the *Boks of Chess*. The first Spencerian library—that which Macaulay describes Lord Spencer, son of the second Earl of Sunderland, as collecting, “while other heirs of noble houses were inspecting patterns of Steinkirks and sword-knots, dangling after actresses or betting on fighting-cocks,” passed to Blenheim, and became the foundation of the collection there. It had been pledged to the Duke, the father-in-law of Lord Spencer, for a sum of 10,000*l.*; and when the second Earl Spencer (who represented the younger branch, made by Duchess Sarah equal in wealth to the elder, which inherited Blenheim) began to form his library, he found nothing at Althorp beyond the ordinary book collection of a large country house. How the “boks” were gathered; how part of the great library of President de Thou found its way to Spencer House; how treasure after treasure—fine copies, uncut copies, unique copies—passed day by day into this vast assemblage; how Charles Lewis was busied day and night in retouching old bindings, and in decorating the rare tomes of Caxton and Wynkyn de Worde with the choicest specimens of “bibliopægistic” art—all this may be read in the pages of Dibdin. Many of the rarer books remained for a long time at Spencer House in St. James’s Place. All have now been removed to Althorp; and the heart of the true bibliomaniac (if such a being still linger in the world) must burn within him as he paces room after room lined with such treasures as no other château in the world can show. One Caxton elsewhere is precious. Here are dozens; and the history and development of the “ars impressoria” is nowhere else to be followed so clearly. The books moreover are lodged as they should be, not in a vast dreary apartment, rarely entered and little attractive, but in a series of rooms opening one into another on the ground-floor of the mansion, thoroughly comfortable, and in daily use. Here and there a portrait, or some picture of unusual excellence, breaks the line of the cases. All the books are richly and appropriately habited, and cast what Dibdin well calls a “heart-warming glow” throughout the long range of apartments—so long, that as the same ingenious writer suggests, “a Shetland pony might be conveniently kept, in ready caparison, to carry the more delicate visitor from one extremity to another.” One room, of which the dimensions are by no means small, is devoted to books printed before 1500. Here are Aldines of the greatest beauty, and here the long rows of Caxtons, Pynsons, and De Wordes “bend the groaning shelves,” and strike the most hardened collector with wonder. Here too is the celebrated Valdarfer Boccaccio, bought by the Marquis of Blandford at the Roxburghe sale for 2,260*l.*, the largest sum ever given for a single volume—or indeed for any book except the Mazarine Bible in two volumes, which at the sale of the Perkins Library in June, 1873, brought 2,690*l.* The great sum given by Lord Blandford for the Boccaccio was owing to the zeal of his rival, Lord Spencer; who subsequently acquired the precious volume for the comparatively moderate price of 918*l.* The book is certainly a beautiful one, and in the finest condition; yet, in spite of Dr. Dibdin, the green morocco of Charles Lewis, sprinkled with gold ornaments, and bearing the arms of the Duke of Roxburghe, and of Earl Spencer, seems hardly the most fitting dress for it. It recalls too much the fierce struggle of the auction lists. This, and the other treasures of the “old book room” as it is called, are more carefully protected than the rest of the library. But there is a general rule that no book may be taken down save by the librarian, who is assisted by an excellent catalogue, in many small volumes, arranged in a cabinet. Each book there entered has its number, referring to a large general volume, which gives its situation in the library, so that it can be found at once.

It is difficult to tear oneself from such a library, which, like Prospero’s, “were dukedom large enough” for the true student. But the park and the church should both be visited, and that not hastily. The flower-garden at the side of the house occupies the site of the bowling-green on which King Charles, who was in the habit of riding over from Holdenby, was playing when news was brought that a party of horse, “obscurely headed,” was in sight; and the King instantly returned to Holdenby, to fall into the arms of Cornet Joyce. The towers of Holdenby were then within sight from Althorp. But the woods of successive planters have grown up to intercept the view, and to afford a pleasanter and richer home scene. These planters have in most instances commemorated the date of their work by tablets and inscriptions, the “only instance,” says Evelyn, “I know of the like in our country.” The earliest dates are 1567 and 1568; and a long walk towards the church leads through a wood planted by Sir William Spencer in 1624. On the reverse of the stone which records this are the words “Up and bee doing and God will prosper.” It is interesting to compare the size and growth of the trees with the dates at which we thus know that they were planted. They are for the most part beech and elm; but many venerable oaks, older than the first recorded date of planting, shade the higher part of the ground, about the church of Great Brington. Here, passing into the churchyard, a view opens before us which would be striking anywhere, but which in Northamptonshire is so picturesque as to be hardly consistent with due respectability. There is no spot like it in the county; and the broken, wooded valley might belong to Somersetshire or to Devon. The church is full of

Spencer monuments, illustrating, no less than the portraits in the gallery, the changes of art and of fashion. The earlier effigies are accommodated in a fashion which is happily rare. They are half covered as they lie on their high canopied tombs with a species of heraldic counterpane, duly turned back at the top, and adorned all over with divers shields and blazonings. The effect is not pleasing; and the later Chantry figures, although the works of that sculptor generally find a more appropriate home in a great hall or public building than in a church, indicate a return to a far better and higher feeling.

THE TIMES ON ELECTION OF BISHOPS.

IT is plain that Sir William Harcourt has his admirers and imitators. We stumbled some time back upon a paper which thought that “the late Solicitor-General” had altogether routed Mr. Gladstone, Mr. Hardy, and everybody else, and had, notwithstanding his own disclaimer, displayed a most remarkable knowledge of canon law. The affectation of ignorance one day and the affectation of knowledge the next certainly seems to pay, and it is no wonder if others take up the same line. Such a one showed himself in the *Times* a few days back on the occasion of the late election of a Protestant Bishop of Kilmore. To the ordinary mind such an election might seem to be of great importance to those who are immediately concerned, but not to be specially exciting to anybody else, and certainly not to be remarkably strange or remarkably funny. But the *Times* appears to have looked on it as being somehow a grand opportunity at once for the display of fun and for the affectation of ignorance. To us it seems not at all wonderful that, in an established Church, the appointment of Bishops should, formally or practically, rest with the civil power. It seems just as little wonderful that, in a Church which is not established, Bishops should be appointed in some other way, and election by the clergy and people of the diocese appears, to say the least, as obvious a way as any other. To the *Times* the notion of a Bishop being elected at all seems something inherently funny, something so strange that the *Times* cannot make it out. It would hardly have done to say that such a thing had never before been heard of in the whole history of Christendom. It would hardly have done to say that it was nowhere heard of among Protestant English-speaking Churches at this moment. That would have been a feat beyond even the *Times* or its model. No ignorance of canon law or of ecclesiastical history could go quite so far as that. No doubt, if we accept the opinion of Sir William Harcourt, ignorance on such matters is highly creditable; still there are bounds to ignorance as there are to knowledge. Even the genius of Sir William Harcourt or of his follower in the *Times* could hardly, by any amount of striving, reach such a degree of ignorance as to think that the free election of a Bishop was a thing never heard of before the disestablishment of the Protestant Church in Ireland. Even among the correspondents of the *Times* there must lurk unseen Gladstones or Hardies ready to expound such a matter as this. Mr. Hoskyns-Abraham, for instance, who is always so willing to inform the public, whether about the sports of the amphitheatre or about the bishopric of Dorchester, would doubtless be ready to write something about the disturbances at Rome at the time of the election of Pope Damasus. And some travelled correspondent might be willing to stoop to the humbler fact that Bishops are at this day freely elected in the Episcopal Churches of Scotland, of the United States, and of some of the Colonies. But the *Times* must have its joke, notwithstanding the facts; so, as the facts could not be denied, they had to be bundled into a corner. To throw facts aside in this way as insignificant or unintelligible is much grander than to take no notice of them at all. It unites the display of knowledge and the display of ignorance; it is as much as to say, what is surely a fine thing to be able to say, that we know enough about the matter to know that there is nothing worth knowing. There must be people who see something fine in such talk as the following, otherwise it would not pay to talk it:—

True, we are all aware—at least, it is reported to us—that there is an Episcopal Church north of the Tweed which elects its Bishops. But that we all believe to be a poor, struggling, provisional makeshift, and not an altogether serious affair. There is hardly a city in the Archipelago, in Syria, or in Mesopotamia that has not half a dozen rival Churches, each with its Patriarch, Primate, Archbishop, and Bishops—on paper all as good as he of Canterbury, or he of Durham. That there is such a Limbo, and that in it there may be a Scotch Episcopacy, we all know; but that does not help the English mind one step to the imagination of an Episcopal Election south of the Tweed. The elections of Canadian and some other varieties of Colonial and American Bishops are equally beyond the range of the ordinary English understanding and experience.

There is something mighty grand in the burly prosperity which looks down upon a Church—or most likely upon anything else—because it is “poor and struggling,” with such utter scorn that it can hardly take the trouble to know whether there is such a poor, struggling thing or not. But we should like to know what idea the writer attached to the words “provisional makeshift,” as applied to the Scottish Episcopal Church. Most likely he merely thought that they sounded big and contemptuous, and did not stop to think whether they meant anything or not. In the common use of words; a “provisional makeshift,” say a provisional government, or any other thing that is provisional, means something which is meant to last only till something else is ready. The *Times* therefore looks forward to a day when this poor, struggling Church,

which provisionally elects its Bishops, will change into something else, perhaps into a rich, prosperous Church, which has its Bishops appointed in some other way. We see no reason to expect anything of the kind; but the *Times* clearly does, or else it simply talks nonsense. But at any rate the *Times* looks at anything poor and struggling as "not an altogether serious affair." We have no doubt that many people in Jerusalem and Rome and Mecca, prosperous people who were not themselves poor or struggling, talked in just this kind of way about certain stages both of Christianity and of Mahometanism. As long as nobody believed but Khalifah and Ali, Islam must have looked very much like "not an altogether serious affair." Then, stirred up perhaps by the visit of the Jacobite Patriarch, the *Times* goes on to talk about the East, to bring in the sweet word Mesopotamia, and to back it up by that other sweet word Archipelago, which is only one syllable shorter. Then it goes on by some strange process of geography to hint that a Scottish episcopacy may be somewhere in these parts, somewhere in the Archipelago, Syria, or Mesopotamia. But why the fact that Bishops can be freely elected in Scotland "does not help the English mind one step to the imagination of an Episcopal Election south of the Tweed," the *Times* does not explain, and we certainly cannot guess. As little can we guess why the elections of Colonial and American Bishops are "beyond the range of the ordinary English understanding and experience." The *Times* says so, and that is all. Anything to which we are not personally used may be said to be beyond the range of our experience, but why is it beyond the range of our understanding? Why should a thing which can be easily done in Scotland, Canada, and the United States be thought so very mysterious in England? There may be very good reasons for not doing the same thing in England, but it can hardly be a thing which Englishmen are unable even to understand. Really the ordinary Englishman is not such a fool as the *Times* makes him out. And the puzzle is heightened when we find that the thing which is so mysterious when done in Canada and Scotland becomes at once intelligible as soon as it is done in Ireland. This is fairly beyond us. Americans, Canadians, Scotchmen, have all doubtless points in which they differ from Englishmen. But we should have thought that the ways of Scotchmen, of Canadians, even of Americans, were all of them easier for an Englishman to understand than the ways of Irishmen.

Funnily enough, in the next article we light by a cross reading, on the words "After all, Canadians are but Englishmen"—these very Canadians whose ecclesiastical doings we are told are unintelligible to the ordinary English understanding. So, in the very article about election of Bishops we read, a little way above the passage which we quoted, that "the bare idea of a real Episcopal Election in this country is monstrous and impossible—till it is tried." The *Times* itself therefore implies that, if tried, it might not turn out to be either monstrous or impossible. How all these statements are to be reconciled, perhaps the *Times* knows; we do not. But perhaps we have done the article injustice by plunging into the middle of it. It was in the middle that we found that very remarkable estimate of the ordinary English understanding, and that very remarkable piece of geography which placed the Scottish Episcopacy somewhere in the Archipelago, Syria, or Mesopotamia. Let us try even now whether any light can be got by going back to the beginning. There, after being told that the election was involved in Disestablishment, and after hearing the *Times* add, as with a sigh, "There was no help for it," we read:—

But the whole idea of a Bishop in this part of the island is that he is from without as regards the diocese he is to govern, and also from above it—as far above it as the formation of society will allow. As he can no longer come from the Holy City, whether that of the East or that of Rome, he is nominated by the voice of Heaven, as expressed by the voice of the people, sublimated and distilled through all possible stages of election and selection.

As far as the words "to govern," this gives us a kind of idea; the rest is as far beyond our understanding as the idea of electing a Bishop is said to be to that of most of our countrymen. "As far above it as the formation of society will allow." What does this mean? We have read it twice or thrice without finding out. Then what is all this about the Holy City of the East whence Bishops can no longer come? Does the *Times* fancy that there ever was a time when English Bishops commonly came from Jerusalem? The sublimated and distilled voice of Heaven—have our chemists learned how to distil a voice?—is explained in the next sentence to mean the voice of the Prime Minister. Some way on we get the following burst, not about Bishops, but about things in general:—

Everything good in this country, so we think, drops from the clouds or springs from the foundations of earth and time. We love to think our faith primitive, our gentry Norman, our Queen a daughter of Odin, our customs Hyperborean, our Constitution a miracle, and our hierarchy traceable as far up or down as we can stretch our minds to.

When the *Times* shall have explained to us what are "the foundations of earth and time," whether they are an elephant or a tortoise, or anything else, we will try to make out something about "primitive faith," "Norman gentry," and "Hyperborean customs," the last at least of which, one might have thought, were quite "beyond the range of the ordinary English understanding and experience." Then too, when we know the "foundation of time," we may be able to guess how far "up and down" the *Times* "can stretch its mind to," for the purpose of tracing a hierarchy. As for the "daughter of Odin," there surely comes a touch of the grand Berserker rage which is not unknown to us. Where so many

things are above us, it is a comfort to light on something within the reach of our faculties, and to be able to protest against English Woden being shorn of his English W.

We agree with the *Times* that the free election of an Irish Bishop is a thing to be heard of "not without emotion." But, without the help of the *Times*, our emotions at such an event would hardly have carried us back to Woden; still less would they have carried us away to Mesopotamia and the Hyperboreans.

AN ALPINE PLAYGROUND OF THE FUTURE.

WE are inclined to take it as a sign of the times and an omen of the future that the Honorary Secretary of the Alpine Club writes an exciting letter in praise of mountaineering in the Caucasus. We do not say that it necessarily proves anything, and we are aware that different commentators may interpret it differently. The most ardent of mountaineers may be the most catholic in their tastes, and a passion for the particular peaks on which a man has raised an Alpine reputation may only prompt him to a faithless adoration of further, if not fairer, rivals. Cynics may suggest, moreover, that an eminent Alpine Clubman recommending outsiders to desert themselves anywhere else than in Switzerland reminds one of the fisherman who praises any stream but that to which he habitually resorts, or the belated tourist who recommends to the companions of his journey all the hotels in the place of their destination except the hostelry which he is bound for himself. For ourselves we are content to read Mr. Moore's letter in its plain sense, and we believe that those who may seek for hidden meanings in it will give themselves very unnecessary trouble. It is certain that the mountain "playground of Europe" is becoming far too overcrowded to be pleasant, and those who knew and appreciated it as it once was may well be tempted to turn towards untrodden summits and virgin glaciers now that they are elbowed at every turn. It is true that there are obvious advantages in the railways, diligence roads, and mule tracks which land you easily at central starting points; in the profusion of snug hotels where you may fortify yourself for a formidable expedition, or recruit your exhaustion after its fatigues; and where the worst misfortune that can possibly befall you is a bad bottle of wine or an overcharge in the bill. And advantages of this kind will be brought specially home to one after listening to what Mr. Moore has to tell us of the deficiencies in accommodation which he had to put up with in the Caucasus. But, on the other hand, when you break away for your autumn holiday from the wearing monotony of everyday life, nothing can be more disappointing than to find yourself haunted by the most objectionable bugbears of our home civilization. Even confirmed Sybarites are willing to rough it for a time, when they can console themselves through a period of suffering with the hope of once again finding enjoyment in the luxuries that have long pulled upon them from habitual use; while the more fortunate mortals who have a superabundance of strength and animal spirits are brought almost to loathe those comforts of existence which entangle them everywhere among swarms of cockneys. The people who are weatherbound at Chamouni, Zermatt, or other climbing centres, are ravenous after the passing gossip of the day, especially when it has reference to the mountains that overhang them. If the visitor has any kind of mountaineering reputation, he finds that it has preceded him and advertised his arrival. His intentions have been betrayed by his coming in the company of the well-known guide whom he has attached to his person by a retaining fee; or else it is his package of ropes and ice-axes that has gained him ephemeral notoriety sorely against his will. It pays the natives of the place to parade him before the travelling public. The landlord and the waiters point at him behind his back; people lay their heads together and whisper about him as he sits at the table-d'hôte, or observe with anxious sympathy the attention he pays to the barometer. True, he may give them the slip in the early morning, when he makes his start for the recesses of the palaces of nature at an hour when all his curious fellow-lodgers are still slumbering peacefully. But the moment that the world is up and about again it does its best to make up for neglected opportunities, taking up the chase where it left it off the evening before. If the climber's movements on the ice are visible from the village or any rising ground in its neighbourhood, they concentrate the attention of all the idlers. All the telescopes are pointed to the sparkling snow-slopes; his progress is followed step by step; his failure would be noted and discussed, as his success makes him more a lion than ever. If he returns in the evening to the place he started from, his arrival is ceremoniously fêted by the local syndicate, and he must sneak away to his bath, and the supper-table through a shower of fireworks which will probably figure in his bill.

Rather than submit to the penalties of fame in this offensive and by no means economical shape, we can conceive the most enthusiastic admirers of the Alps taking refuge in the Caucasus or anywhere else. In the Caucasus, moreover, there is undoubtedly a very great deal to attract adventurous spirits and amateurs of magnificent nature. There are peaks that are loftier than the summit of Mont Blanc, and apparently to the full as hard of access as the Matterhorn. There are glaciers that, as we fancy, dwarf the vast area of the Aletsch, and icy staircases that are quite as formidable as that which leads up to the Col de Géant. Farther, there is the inculcable charm of moving about everywhere among

the mysteries of the unknown—mysteries which must give a zest for many a year to come to the mountain scrambles that may be undertaken in those parts. In Switzerland all the best things have been done already, and duly chronicled in history or romance. There is not a conspicuous peak that has not been trodden by daring feet; scarcely a col that has not been crossed or a glacier cataract that has not been scaled. High-level routes have been puzzled out where night after night you must seek shelter among boulders or under the lee of an ice-wall, or at all events house yourself in a chalet. Men have bid for fame and excitement by striving to improve on the feats of their predecessors in performing awkward expeditions against time or with half-allowance of guides, or even in some instances without guides of any kind. In the Caucasus Kasbek and Elburz have indeed been ascended, but only from particular points of departure, and elsewhere the explorer is always pretty sure to be the first on the ground. There must be an extraordinary fascination in climbing when you know nothing of the magnificence of the prospects that await you, but are only certain that you will be the first who has appreciated their beauties. Nor are the valleys and the lower ranges less interesting in their way than the giant mountains which dominate them, and down among those valleys you can vary your mode of travelling agreeably. The dividing ridges are crossed everywhere by low grass passes, whence you can look up to the perpetually changing views of a grand mountain panorama, and the road leads you through a charming variety of landscape among the flocks and herds of a pastoral people. The inhabitants of the Caucasus resemble the Spaniards in one respect—they always move about on horse-back themselves, nor can they understand any one else going on foot by choice. Of course they will have to reconcile themselves in time to the odd tastes of their English visitors, and doubtless they will do so readily enough when the office of guide to their higher mountains becomes a recognized and profitable calling. But in the meantime their visitors will gain by taking a hint from their habits, and by hiring the clever and spirited little horses of the country to carry them pleasantly from point to point. Many a Swiss traveller has grumbled at being dragged along mountainous lines of route, like that of the Rhone valley, in the interior of overloaded diligences, or in the stuffy compartments of slow railway trains. He has found it vexatious, in making his way to some headquarter like Zermatt, to have to choose between plodding on to it along the carriage-road, or being slowly dragged up against the collar in a chair-a-banc at walking pace. In the Caucasus he may literally indulge himself in the poetry of motion, cantering on the springy turf among the flocks that are browsing on the spurs of the snowy mountains.

Per contra, as they say in the City, we must in common candour take a look at the reverse side of the picture, although it may be considered attractive or the opposite according to the tastes and training of different explorers. We have spoken of the lack of houses of entertainment of any kind, compelling the traveller to throw himself on the hospitality of the villagers, and, whether he likes it or not, to pursue a course of studies in the native character. In Switzerland you know exactly what you have to expect in that way; when you are in doubt you may consult the guide-books. There are hotels where you will be made comfortable and treated fairly. There are other hotels where you are taken in and done for. The bulk of the classes whose services you have occasion to retain have been shamefully demoralized by the influx of tourists, although there is a certain number of honourable guides who are like "gold as has passed the furnace," as Mrs. Harris said of Mrs. Camp. In the Caucasus, as yet at least, your reception in any particular village seems to be much more a matter of lottery than the scenery which you have set out to investigate. In the latter case, weather permitting, you are sure to be gratified more or less; in the former, it is far from certain that you will be equally well satisfied. One set of villagers put strangers to ransom in the most remorseless fashion, and are said to have so little idea of our beautiful system of credit that they will not even part with an egg without actually receiving the coin it costs in exchange for it; while their neighbours in the next valley insist on entertaining you gratis, and only consent to be remunerated at your departure if you are at extreme pains to save their susceptibilities. On the whole, however, it would appear that this generous hospitality is the exception. In most places Mr. Moore found it hard work to bargain for porters, and harder still to coax them along when they were caught. Guides they can scarcely be called, for, as the mountaineers are an equestrian race, and indisposed to unnecessary pedestrian exercise, we may presume that they seldom venture on their own account above the passes which they must travel in the way of business. There is no doubt that, as Mr. Moore says, the ardent English mountaineer is likely enough to be disappointed with the country as things are there at present. The ambitious Alpine man is willing to make any reasonable effort to achieve some deed that will redound to his glory; he is perhaps ready even to run unreasonable risks, reconciling them to his conscience by the ingenious sophistry which he has cultivated. But his conscience will remonstrate when he is plainly trenching on the line that divides insanity from mere imprudence. Thus a peak may be fairly accessible when you make your attack on it after due deliberation, from some established base of operations, accompanied by guides or attendants of good local experience, and with an ample supply of suitable provisions. But in the commonest prudence you must give it up as suicidal or

impracticable if you can count on none of these necessary conditions in your favour. At the same time, we may be sure that districts like the Caucasus will be more and more visited as communications with the frontiers of Europe and Asia are made easier, and as Switzerland becomes more and more overrun. One man will attempt this undertaking, another man will succeed in that other; the inhabitants will gradually learn to appreciate the value of their visitors, and will exert themselves to help them out in their eccentric vagaries. Still, though Caucasasia may be steadily reclaimed, it is never likely to lose a strong smack of savagery. In any case it is a long way removed from the head-quarters of all the Alpine Clubs. Its fierce inhabitants, used to handle the knife and the yataghan from time immemorial, are as little likely to be absolutely tamed as the desert descendants of Ishmael. It has been annexed, too, to the dominions of a line of military autocrats who are more likely perhaps than any other potentates to trouble the peace of Europe; so that even if it were situated as centrally as the Swiss Republic, hotel companies (limited) could hardly reckon with confidence on regular returns on the capital they might sink there. All the more on this account the country may be destined to come into fashion with the class of Englishmen who have the command of money, who can control their time, and who love to push mountaineering adventure beyond the limit of ordinary cockney travel.

THE TOWER OF LONDON.

THE agitation recently commenced for opening the Tower without payment on certain days may possibly be successful, but great difficulty will be found in carrying out any scheme for the purpose. The present division of visitors into small parties is almost the only plan by which the public can be admitted to see a fortress filled with Government stores and containing many chambers which it would be hazardous to open to all comers. Whether Mr. Hepworth Dixon's description of the Tower as national property is more correct than his theory as to its antiquity we shall not attempt to determine. The nation has certainly great interest in its preservation as well as in securing the privilege of exploring it. Misleading and imperfect as the present system of showing it is, it must be regarded as an attempt, if no more, towards the education of the people in one particular. But very little addition to the intelligent visitor's stock of previous knowledge is to be gained by following a Beef-eater. After a visit, if we turn to any of the authorities, and especially if we consult Mr. Clark's valuable paper in *Old London*, it will probably be found that we have come away with a very inadequate impression of what the Tower really is, and have great difficulty in identifying the places he mentions, while in many cases we are quite unable to recognize them. The more we read of his paper, which is as complete as all the rest of his work, the more we find we have missed. In fact anything so confusing to a person of ordinary intellectual capacity as a visit to the Tower can hardly be conceived. Nor does the kind proposal of Mr. Dixon to conduct a party offer to such a one any very distinct hope of a clearer mind.

The visitor under the present arrangements is first ushered into a place very like a railway station, on Tower Hill. There he takes his tickets, declines to buy photographs, cats buns, and otherwise passes the time till he is summoned to follow the warder. Parties are always constituted in much the same manner. Two or three foreigners, who, though they may understand English, are puzzled at Scotch, and find it impossible to reconcile what they hear with what they read in their guide-books; a soldier or two—soldiers are very fond of the Tower; a few confiding persons who listen to everything they are told by the Beef-eater; and, on most occasions, a young gentleman who knows better than the guide, and argues or asks awkward questions—such is the party, with the usual addition of a baby in arms, which cries at inopportune moments, and perhaps some ladies, who neither listen themselves nor care if their conversation prevents others from hearing. The party first passes through several archways, and at the last of them is informed that the building overhead is named the Bloody Tower because there the children of Edward IV. were smothered—a reason which is not very satisfactory, and is more appropriate perhaps to the circumstances traditionally connected with the death of Henry VI. in the adjoining building. Some dismounted cannon are next passed, and the visitors enter the Horse Armoury, where a rival party is encountered, and both have the advantage of hearing two warders discoursing at the same time, and usually derive most information from the speaker who is endowed with the loudest voice. In one or two particulars the older visitors observe changes. The Beef-eaters no longer wear the picturesque Tudor costume. Their dress has lately been assimilated to that of a recruiting sergeant. In the Armoury too the old labels are no longer to be seen. Instead of every mailed knight bearing the name of a king, beginning with Richard Cœur de Lion himself, the various suits have been named with some regard to historical accuracy, and the sightseer is perhaps disappointed to find how little of it is older than the fifteenth century. He next mounts to Queen Elizabeth's Armoury, remarking on his way that, to judge by his effigy here, James II. went into battle wearing something very like spectacles, and mounted on a cream-coloured horse. Upstairs he finds a figure of Queen Elizabeth, with a page leading her horse to St. Paul's, a view of which is painted in the background. The unity of the piece is

rather disturbed by the instruments of torture in the foreground, and the axe and block with which the same Queen's mother is said to have met her death, though, according to all authorities, Anne Boleyn was beheaded with a sword. Time was that visitors were allowed to lay their heads on the block and to finger the edge of the axe. The loss of such a privilege may in part be compensated by doubts of the authenticity of the implements, of which even the Beefeater is sceptical. Perhaps if Mr. Dixon gains his point, this and other favours of the kind will be restored to the people, including permission to kiss the scavenger's daughter and to try on the iron collar, which are surely also a part of the national property.

Visitors next descend through the Horse Armoury, and, passing out into the court again, enter the White Tower by a modern staircase. Behind it in the wall the bones of the Princes were discovered in 1673. Suddenly they find themselves in the chapel of St. John, which, to their astonishment, looks as if it were only a few weeks old. After leaving the chapel, the unfortunate sightseer is conducted, for a weary ten minutes, through a labyrinth of artillery. Swords twisted into laurel wreaths, gun-locks into olives and acorns, trophies of small-arms, including the wedding cake of the Prince of Wales in bayonets upside down, and many other subtleties more or less intricate, not only disguise the walls and roof which he wants to see, but offer him an opportunity of testing by experience the feelings of Damocles, which he may have been quite willing to take on trust. There is next an upward climb through a newel into another series of similarly decorated apartments, and then a wild plunge downward, followed suddenly by an escape into the open air, and a vision of barracks, with a squad of recruits drilling in the court. The visitor has now done the White Tower.

It would be tiring to follow him through the Beauchamp Tower, where the walls of one chamber bear the inscribed stones collected from all the prisons—an unfortunate arrangement depriving both the carvings removed and those which are in their own place of much of their value; or into the Wakefield Tower, where the regalia are now kept, and where all the traditional names of crown and sceptre, cup and spoon, are detailed to him. He emerges on Tower Hill after a couple of hours of severe exercise, during which he has unquestionably found much to interest him; he has seen a great deal well worth seeing, and carries away vivid impressions of several historical events. He has been to a show, but it is a show not very different in character from that provided in Baker Street. In some respect it is not quite so good. Madame Tussaud would not have put Wellington's uniform, or Wolfe's greatcoat, under a glass case, but upon a lay figure, to be seen and studied of all. As curiosities they do very well; as examples of costume they are useless. It must still be allowed that, with these and some other trifling exceptions, the Tower considered as a mere show is rather superior to any exhibition of wax-works, even under present arrangements; but a majority of the sightseers who visit both places might not be found to agree in this view. Perhaps the appearance of Mr. Hepworth Dixon as showman will turn the scale. On the whole, the regular worshipper of relics has little to complain of at the Tower; he gets a very good share of enjoyment for his shilling or sixpence.

But he has not seen the Tower. He has had no opportunity of studying the construction and arrangement of the most perfect Norman keep in England; he has had no chance of examining the architecture and defensive features of a long line of Edwardian fortification; and if he is merely a relic-worshipper, he has not been allowed to stand by the graves of the illustrious victims whose sufferings and whose story have brought him there. The two most interesting things in the Tower, after the Donjon itself, are unquestionably the Church of St. Peter ad Vincula and the Lieutenant's Lodgings. Neither of them is shown. After the Beauchamp Tower, the upper and the lower floors of the Wakefield Tower and the so-called vaults under the White Tower where Guy Fawkes was confined, are of surpassing interest. They are not shown. And of what is shown the visitor carries away a most erroneous impression. He has no means of knowing that the Horse Armoury is not a part of the building, but a mere lean-to of modern construction. The entrance to Queen Elizabeth's Armoury is by a window; the apartment itself is the crypt of the chapel of St. John above. He is not told this, nor is he able to discover where the original entrance to the Keep is supposed to have been, and he may look for it in vain. Certain stereotyped stories are related to him. He hears of the execution of Queen Anne, and even of Lord Hastings, but he cannot of himself tell that in the chapel the body of Elizabeth of York lay in state in 1503, or that Richard II. formally resigned his crown in the Council Chamber. Indeed the Council Chamber itself is so disguised with trophies and stands of arms that it is not worth a visit. He may seek fruitlessly for the room from which Bishop Flambard let himself down, or for the sole remnant of Bishop Gundulph's windows. He has no power of observing that the plan of the principal chambers is the same from basement to roof, or of seeing the party-walls which divide them. The light of nature will almost tell him that the windows are of Wren's period, but how can he know that the roof and floor of every chamber, except the chapel, are of wood? To the ordinary sightseer these may be matters of small importance, but to the intelligent audience to which Mr. Dixon addresses himself they should be primary objects of inquiry.

It may not be possible to open the Lieutenant's house or the Church of St. Peter. But without them the Tower is deprived of two of its principal features. There remains little or nothing of

the Palace, but the Lodgings are the scene of nearly all the most remarkable events which have taken place within the circuit of the walls for three hundred years. Here it was that the Lady Jane stood at a window and saw the body of her husband carried past on its way from the scaffold to the grave. Here a little later, in the Council Chamber, which still exists intact, Guy Fawkes was tortured in such a fashion that his groans have been said to haunt the room ever since. From another part of the same buildings Lady Nithisdale rescued her husband in 1715, and probably they were also used after the Forty-five, and were the scene of the extraordinary revelry of which Sir Walter Scott speaks, when, owing to the care of their friends, the rebel lords were supplied with money and luxuries. The Governor's Lodgings communicated with the upper story of the Bloody Tower, from which Archbishop Laud blessed Strafford on his way to the block. They probably were also connected with the adjoining Wakefield Tower, where Henry VI. is said to have been murdered, and a bridge crossed the roadway to St. Thomas's Tower over the Traitors' Gate. But many of the most interesting prisons have not been identified as yet. Whence was it that Lord Wintoun escaped after his friend Nithisdale? Lord de Ros does not tell us; nor where Sir Francis Burdett was lodged; nor do we know where Arthur Plantagenet, Viscount Lisle, received the news of his liberation, when he was so overjoyed that he died on the spot. The details respecting the place and manner of custody of Catherine Howard and her confidante, Lady Rochford, or of old Lady Salisbury, or of many another princely and noble victim, have still to be made public. Much has yet to be done of the kind which Mr. Clark has given us in his memoir. There are records in existence which would throw light on some of the darker scenes, and very obvious sources of information have by no means been exhausted. In many particulars information is still wanting. There is no available list of the Lieutenants or Governors. That given by Lord de Ros only extends back to 1690. But, in truth, the full history of the Tower of London has yet to be written.

The famous passage of Macaulay in which he speaks of the Church of St. Peter is familiar to all, but what he calls the barbarous stupidity which has transformed it into the likeness of a meeting-house has never, even in these restoring days, been rectified. There was some talk of a subscription to commemorate Borgeyne and his gallant son by such a work, but nothing seems to have been done. The tragic interest of the place needs no recommendation. Most of the graves are well identified. Lord de Ros says that the body of Sir Walter Raleigh was laid there, but it is certain that he was buried in St. Margaret's, Westminster. Possibly a careful examination might show some remains of the building which stood on the same spot as early as the reign of King John. Edward III. made it a kind of collegiate church, with a dean and three canons, as the "royal free chapel of the King's household within the Tower"—a foundation suppressed under Edward VI., if indeed it was ever fully completed. It is at present a rectory, the precincts constituting a populous parish.

Better information is at hand as to the Liberty of the Tower. James II. ordered an inquiry respecting it, the result of which is printed by Bayley, who also mentions how nearly the Great Fire approached the walls in 1666. All the houses on the ditch side were pulled down, and it is perhaps on this account that Tower Hill is now so clear; but even as lately as on the occasion of the execution of the Scotch lords, buildings existed which have since disappeared. Among the boundaries mention is made of Pye Corner; perhaps this was the place, rather than another place of the name near St. Sepulchre's Church, which gave rise to a saying that the fire began in Pudding Lane and ended at Pie Corner.

RESTAURANTS.

ONE characteristic of English manners and customs in the present day is a strange mixture of civilization and barbarism. This is an accident inseparable from an age of rapid progress, and rapid progress is the distinguishing mark of what a popular preacher contemptuously termed "this so-called nineteenth century." It sets up new institutions in the place of old ones which it overturns with a sudden shock, affording no spare time to clear away their wreck. Sometimes it introduces its ideas with a slow, steady pressure, content to establish them on a level equal to that of their predecessors, and trusting to the resistless force of time finally to establish their superiority. This force, however, works from the past as well as for the future, and old institutions have a store of strength which enables them to offer a sturdy resistance in their own defence. Thus, whether the establishment of innovations be violent or gradual, it is sure to be hampered with the weight of obstructions not wholly cleared away. This principle is nowadays exemplified in many matters which may be thought of greater moment, but hardly in any more strongly than in those which concern the science of eating. We use the word *science*, although it is to be feared that much time must elapse before the majority of English people will think such a name fitly applied to such a subject. Herein lies the difference between the English and the French with other nations of the Continent. The Englishman looks upon the provision of adequate and proper supply of food for himself as a duty which devolves upon him as a respectable member of society. The Frenchman's gaiety and lightness of heart lead him to regard it as one of those happier necessities of life which are capable of assuming the form of a re-

finest pleasure. For the care and attention which he bestows upon his dinner he is sneered at and denounced as greedy by his insular neighbour. But it is difficult to see why it is less greedy to be bent solely upon the devouring of a certain amount of food than to take thought also how such devouring may be rendered agreeable. There is a good maxim that whatever is worth doing at all is worth doing well. Little doubt can be entertained as to the fact that it is worth while to eat.

The conservative element of which we have spoken above militates strongly against improvement in the art of cooking, and, which is more to our present purpose, of serving food. Professors of this art hailing from the country which practises it in perfection have been domiciled in England at clubs and great houses, and have written text-books and works of reference which have been widely read. One Englishman at least, the writer of "Walker's Original," has given to the world a dissertation which may claim to rank with the foremost of their productions. It must be said that in clubs and in some first-class places of entertainment the influence of civilization has made itself felt. Elsewhere, however, the old leaven is still strong. A wonderful prejudice exists in the English mind in favour of what is called homely food and accommodation. There never was a greater contradiction in terms than this. The name of home is well associated with the idea of comfort. It would be difficult to point to a more uncomfortable form of entertainment than that which is usually thus designated. A bare floor, a small room divided off with wooden partitions, a violent odour and savour of cooking, these things are well enough as quaint diversions to a journey when found in a country inn by a tired traveller, but seem strangely out of place in the midst of a civilized capital. In the former case they bring with them a pleasant flavour of old times and associations, and soothe the traveller's fatigue by carrying him out of the hurrying whirl of the present into the quiet of the past. In the latter they bring added vexation and weariness of spirit to the professional man who is often fain to resort to them for want of any better means of refreshment. With regard to dinner there is perhaps not much cause of complaint; for everybody nowadays belongs, or is supposed to belong, to a club where he can be decently and even luxuriously served. But there are few men who find it wise or convenient to go through the day without luncheon, and at the time for luncheon the man of law or of business is ordinarily out of reach of his club. Then it is that he is often forced to betake himself to those homely taverns the merits of which have been so perniciously over-rated. It is true that he can there obtain, in perfection so far as cooking is concerned, either of those two bulwarks of English cookery—a chop or a steak; but in order to do so he must for the time being return to the earliest and most barbarous instincts of his race, and become a predatory animal. So great is the demand for these estimable dishes, so small the space in which they are served, and so insufficient the service, that the obtaining of them is reduced to a question of skilful and watchful hunting. It is true that more modern places of entertainment with large rooms and carpeted floors have sprung up around these venerable institutions; but in them the same faults of service prevail. They manage to combine extreme slowness with an oppressively businesslike air. A dismal gloom hangs over the task, which should be a pleasure, of refreshment. One sighs for the gaiety and brightness of a Continental restaurant, which are nowhere to be found in London.

It is probable that the system of club life established here is in a great measure answerable for the want of pleasant restaurants. In Continental towns clubs are places established for the purposes of reading, smoking, conversing, but not for that of eating. If they were, the restaurateur's occupation would be to a great extent gone. Thus it may be urged in the defence of London that, as clubs exist in large and increasing numbers, there is no such necessity for the existence of restaurants as there is on the Continent. Yet, as a certain number of restaurants do exist here, there seems no reason why they should not copy the dexterous waiting and the clean and pretty appointments which distinguish the first-class Paris restaurant. That the same neatness and perfection do not penetrate to the lower strata of Paris eating-houses is proved by the story of the *habitué* of one of these who returned to his old haunt after an absence of some years. Having dined to his satisfaction, he called for a toothpick. The waiter was sorry to inform him that they kept none. The diner indignantly remonstrated, and pointed out that formerly these luxuries were always supplied. "C'est vrai, monsieur," replied the waiter, "mais figurez-vous la bassesse des hommes. On les emportait!" It is probable that such an incident as this could never occur even in an inferior London eating-house. The Englishman is accustomed to a great deal of noise, of inattention, and discomfort, but not to an utter want of cleanliness. He will submit meekly to a dingy tablecloth and an ill-polished glass, but not to the notion of such foul economy as is suggested by the story just told. His ideas of homely comfort may be in reality thoroughly uncomfortable, but they will never be thoroughly unclean. He will look, and that not unjustly, upon the splendour which is obtained by the sacrifice of individual toothpicks as a kind of whitened sepulchre. Thus the certainty of decency throughout the whole of our system militates against the assurance of refined comfort in the first ranks of another. Yet when all has been said that can be said in favour of the English system, the fact still remains that it is next to impossible to obtain in a London restaurant that which can readily be obtained in Continental cities—a good luncheon or breakfast thoroughly well served.

There is, however, in Great Britain at least one restaurant specially adapted for the needs of the many who eat luncheon, which may safely challenge comparison with the best of Continental establishments. The restaurant which is known as Lang's in Glasgow is unique, and, as all unique things should be, perfect. It is in its way complete, polished, and well finished. It is strange that that which is absolutely wanting in London should be brought to absolute excellence in a Scotch city. Scotch cookery has often afforded matter for scorn to the fortunate inhabitant of the great city who is apt to take everything unknown for an absurdity. He regards the haggis and the sheep's-head with mingled awe and disgust. He has neither time nor inclination to acquire a taste for these peculiarly Scotch dishes. And upon these, as is his wont, he generalizes from his own point of view, and concludes that the palate of the Scotch nation is in a state of utter barbarism. Yet London might with very great advantage learn a lesson from the Scotch restaurateur. In Glasgow, just as in London, business men of all kinds feel the want of some place where they can obtain a mid-day meal which shall be at once comfortable and inexpensive. The difference is that in Glasgow this want is supplied, while in London it is not. Yet the means of supplying it are singularly simple. Lang's consists of one large room, studded with a few tables and chairs. The staple of the entertainment provided is sandwiches. To the ears of the outer world the name of sandwich suggests a vision of horror. It conveys the idea of hard, stale, possibly fly-blown, combinations of bread and meat laid nummy-like beneath a glass case. Behind it rises the picture of the railway station harpy who was so well described by Dickens in *Mugby Junction*. It brings with it the memory of wretched empty journeys rendered yet more wretched by the vain hopes of alleviation for their emptiness. Only he who has been fortunate enough to penetrate the inner mysteries of this Scotch restaurant can know how pleasant an interpretation the word "sandwich" is capable of bearing. The sandwiches with which he is acquainted are glorified, even poetic, sandwiches. Every flavour which the earth contains seems laid under contribution to give them effect. Fish, flesh, and fowl are alike pressed into requisition for their service. The idea of a grouse or oyster sandwich is startling at first; but in this, as in many other cases, wonder passes quickly into admiration by the light of experience. It is not upon this alone, however, that the fame of the Scotch restaurant depends. Cakes of various sorts, such as may reasonably or unreasonably be required by the seeker after luncheon, are provided in ample quantity. Drinks of almost every denomination are ranged around the room in casks or jars according to their kind. An admirable neatness pervades the whole place. The question of attendance, which is the great difficulty of London restaurateurs, and the great annoyance of their customers, we have not yet entered upon. This difficulty is overcome in a very simple manner by dispensing with attendance in the ordinary acceptance of the term altogether. Each customer helps himself to such meat and drink as he desires, and reports the amount of his consumption to the head man in charge as he goes out. It may be supposed that there is some kind of check kept upon the proceedings of the guests, but, if this is so, there is no evidence of it perceptible to the visitor. It must be said that the great majority of the people who are to be found in the place are regular customers, and that among them there naturally exists a certain *esprit de corps* which makes them keen to detect any offence against the honesty with which they are credited.

In the whitest flock, however, it is natural to imagine that there must be some black sheep, and thus it is rather surprising to find how seldom dishonesty makes its way into this restaurant, which depends for its success upon confidence in the honesty of human nature. Its proprietors are said to have made an accurate calculation as to their losses from the inborn or acquired wickedness of mankind. They count upon two customers in every year practising upon their belief in human nature, and upon always detecting those two men. As the boy is father to the man, this is a strong argument in favour of the wisdom of those schoolmasters who will rather trust to their pupils' honour than to the force of severe discipline. Anyhow it is to be hoped that the principle of honesty is as strong in London as in Glasgow. It is certain that there are as many men in London as in Glasgow who would be glad of a resort for luncheon which should be at once pretty and comfortable. There is really no more difficulty in making a pretty place than an ugly one. There is perhaps more difficulty in putting such trust in his fellows as the manager of the Glasgow restaurant has put. It is by this capacity of faith, however, that he has avoided the great difficulty of attendance which stood in his way; and he has found his reward for that faith. It is more than probable that anyone who founded the same system upon the same faith in London would find his account in doing so. It is certain that he would be encouraged to success by the gratitude of many people for whose daily misery at the hour of luncheon he would substitute content, if not happiness.

THE TYRANNY OF COMPANIES.

AS citizens of what is supposed to be a free country, Englishmen are certainly subjected to some very strange and irritating forms of tyranny; and perhaps the worst of these is the tyranny of public Companies. It is true that these engines of oppression owe their existence to the voluntary submission of the public, and that they continue to exist, or at least to exercise such

exorbitant and arbitrary powers as they now lay claim to, only by sufferance. Still the tyranny is not the less exasperating and degrading because it is self-imposed and tamely accepted. In old days it was the great lord and proprietor of a district who did what was right in his own eyes, and set himself up as a law unto himself; and public spirit took the shape of opposition to his despotic doings. This sort of autocracy is now represented by public Companies, the mere creatures of the public will, who retaliate on their creator pretty much after the fashion of Frankenstein; and there is apparently not sufficient public spirit left to organize effectual resistance to this vexatious and humiliating tyranny. There are the Railway Companies, for example, who can do almost anything they please with their passengers; delude them with false time-tables, provide for their protection by paper rules which no attempt is made to enforce, detain them for any length of time on a journey, or slaughter them by the score and maim them by the hundred, as the Great Eastern did the other day, for the sake of doing a little more business in fish. No doubt the Companies are liable in damages, but it is not everybody who has a long enough purse or sufficient courage to fight a Railway Company through a series of courts on the chance of obtaining a sum of money which will have been already swallowed up in the effort to get it. A Railway Company kills the father, and is often enabled to defraud the destitute widow and orphans of all compensation, or at least of adequate compensation, by the very ruin which it has been the means of producing. There is no sort of doubt as to how the Thorpe accident happened. It happened because the Great Eastern would not go to the expense of a double line, and because of the irregularity and bewilderment introduced into the system of working by the chronic unpunctuality of trains, and the utter neglect of rules and discipline among the officials. Yet at this moment the Great Eastern is probably carrying what it ironically calls its "pleasure traffic" close to the jaws of death in just the same reckless fashion as before; and there is certainly nothing to prevent its doing so if it chooses. On the other hand, just observe how firmly a Railway Company holds the public in its grasp. If a first-class passenger cannot find a seat except in a third-class carriage he gets no redress, at any rate unless he undertakes a costly suit at law; but if a second or third class passenger happens to jump into a first-class carriage because all the others are full and he is unwilling to lose the train, he is treated as a common thief. A Company can smash a passenger any day with a fair chance of practical impunity, but a passenger who gets out of a train which he imagines has been stopped, but which suddenly jerks on again, is liable to imprisonment. It may be said that these things are so simply because the public has chosen that Railway Companies should enjoy these powers, and did not think it necessary to provide protection for itself against the arbitrary abuse of them. But it is now perhaps necessary to consider whether the time has not arrived when this defect had better be amended.

The Railway Companies are, however, not the only corporations who assume the right of tyrannizing over the public to whom they are indebted both for their revenues and their privileges. The other day, for instance, a case was heard at the Southwark Police Court which illustrates in a very striking manner the way in which some other Companies occasionally behave. The Secretary of the Phoenix Gas Company was summoned for unlawfully refusing to supply Mr. Hillier, the keeper of a refreshment-house, with gas. Mr. Hillier had been a customer of the Company for seventeen years, and had paid his gas bills regularly during that period, until last summer a charge of 10*l.* 19*s.* 9*d.* was made for gas alleged to have been supplied between Lady-day and June. These are of course light summer months, when days are long and comparatively little gas is used. Mr. Hillier had never before paid more than 5*l.* for his gas during this quarter, and he therefore felt that there must be some mistake in the demand for more than twice that sum. The Company referred to the meter in support of their claim, but when the meter was tested by the Government Inspector, it was condemned. The Company could not resist this decision, but they refused to allow more than 9*s.* as a deduction from the bill on account of excessive measurement; and Mr. Hillier received a peremptory intimation that, if he did not pay 10*l.* 10*s.* 9*d.* at once, his gas would be cut off. He took the matter before a magistrate, and the Company then offered to make an allowance of 4*l.* 16*s.*, which he refused. Subsequently it was arranged that the allowance should be increased to 6*l.* 4*s.*; but the Company, when they sent in their bill, made it a shilling more than it ought to have been, and intimated that, unless this charge was paid within three days, the gas would be cut off. As Mr. Hillier refused to pay, he was accordingly deprived of gas. The magistrate, who remarked that the Company had behaved in an improper manner, and that such proceedings could not be tolerated, imposed a fine of 40*s.* and costs, with an additional penalty of the same amount for every day's delay. Again, in another recent case which has been described in a letter to the *Times*, we find a Water Company accused of acting in a similarly oppressive and tyrannical manner. A householder who has punctually paid his water-rate for seven years, with the exception of accidental arrears on account of temporary absence from home, complains that on his return from the seaside last week he found, among other papers which had not been forwarded to him, a notice from the Grand Junction Waterworks that, if he did not pay his arrears within a few days, the supply of water to his house would be at once cut off. He wrote immediately to the Secretary explaining the reason of his neglect, but as he was busy, he did not at the moment send the money. The answer to his letter took the form of a

couple of men with pickaxes and spades, who carried out the threat of the Company. The householder went to the Company's offices, paid the arrears, as well as the rates due up to the next quarter-day—upon which the officials insisted—and obtained an order to the workmen to suspend their operations. But this was too late, for the water had already been cut off. Before the supply was renewed, the householder had to pay the Company for new brass taps and the labour involved in cutting off the water, in addition to employing a plumber at his own expense to re-connect the pipes.

It will be observed that in the first of these cases the Gas Company deliberately and persistently endeavoured to exercise illegal authority; and that in the other case the Water Company, although acting within its legal powers, behaved with wanton and unnecessary harshness. It may perhaps seem a small matter that the supply of gas or water should be cut off for a day, but it is really a very serious annoyance, and even injury, to say nothing of the insult which is involved. It would certainly have been wiser if the householder whose water supply was suspended had sent the money along with his apology for delay in paying it; but, as the Company had had seven years' experience of his solvency, they might very reasonably have waited a little while before carrying out their threat. When an ordinary shopkeeper has a difference with a customer as to the amount due, or doubts the intention of the latter to pay what he owes, he may fairly refuse to supply him with any more goods until past obligations are disposed of. But a Gas or Water Company is not an ordinary shopkeeper, and its customers cannot go elsewhere for what they want, as those of a shopkeeper might do. The supply of gas or water in a particular district is practically a monopoly, and the Companies which have the advantage of this monopoly cannot expect at the same time to enjoy the same degree of freedom in their dealings with customers as a private trader. It may be said that there is no grievance here, as any one who thinks he has been ill-used can get redress by going before a magistrate; but then there are many persons who find it very unpleasant to go before a magistrate, and who would rather suffer in silence than come forward in this way. The number of cases of harshness and oppression which have lately come to light may be taken as an indication of the existence of more numerous cases in which, from timidity or false shame, no resistance has been offered to the high-handed conduct of the corporate despots. In any case it seems not unreasonable that, as an aggrieved householder has to go to a magistrate for protection, the Company should similarly have to go to a magistrate when it has a case against a customer. The danger lies in a Company being placed in the position of plaintiff, judge, and executioner all rolled into one. A Company is just as likely to be mistaken in a case affecting its own interests as anybody else, and it is rather hazardous that it should enjoy the power of immediately carrying out a decision which it has itself given in its own favour. If Companies were wise, they would perhaps see the prudence, if not the propriety, of being not quite so brusque and hasty in exercising their peculiar powers over the public, which, as it in the first instance conferred these powers, may perhaps some day think it necessary in self-defence to take them away.

THE RELIGIOUS CONFLICT IN SWITZERLAND.

THERE is a paper in the current number of *Good Words* on "the Conflict in the Bernese Jura," which curiously illustrates the perverse and one-sided view of such subjects often taken even by persons who know a little more about them than can be gathered from the infallible revelations of "Our Own Correspondent." Mr. Hogg tells us that he has just returned from a trip through the Bernese Jura, that he was desirous of fairly hearing both sides of the question, and that his first informant was one of the most zealous of the exiled curés, whose conscientious adherence to his convictions he could not help admiring. Nevertheless he speedily arrived at these two conclusions; first, that "the Liberal Catholic party includes very real and important though mingled elements"—a comment which might be safely made on any party that is sufficiently important to be worth commenting on at all; secondly, "that the word 'persecution' applied to the conduct of the Bernese Government is simply out of place, a misuse of language." The reason given for this latter assertion is that, after careful study of the principles of the Syllabus and Encyclical, Mr. Hogg is convinced that "no free constitutional Government could admit such claims." We have probably quite as little sympathy with the peculiar doctrines of the Syllabus as the writer in *Good Words*, but we have very considerable sympathy with a principle which the Syllabus condemns, and which he appears to have forgotten, and that is liberty of conscience. No doubt Mr. Hogg would at once declare that he agrees with us, only he has fallen into the not uncommon fallacy of confounding liberty of conscience with liberty for his own conscience. We will first glance at the facts of the case in the Bernese Jura, as recounted by Mr. Hogg himself, and afterwards say a word as to the condition of Old Catholicism in Switzerland generally. How far "the word persecution is a misuse of language" our readers may then be left to judge for themselves.

The Canton of Berne, according to the latest returns, contains 506,455 inhabitants, nearly a fifth of the entire population of Switzerland. Of these about one-eighth, 66,022, are Roman Catholics, and were formerly under the charge of more than a hundred priests; but the great majority of these have been banished for

signing a protest against the interference of the Government in Church matters, and twenty-two Old Catholics have been thrust into their places, to whom twenty-eight more are shortly to be added, as it is calculated that by a rearrangement of parishes fifty may be fairly expected to do the work hitherto discharged by double that number. This substitution of Old Catholic for "Ultramontane" pastors has been made, it must be remembered, by the civil power against the wish of the great majority of their congregations. Mr. Hogg admits that "the Ultramontanes are in a considerable minority, especially in the country districts," probably numbering about four-fifths, and that the minority is swelled by "non-practical Catholics, indifferent, in many cases free-thinking and heedless of their religion"; while there are of course "neuters who will probably end by joining the winning side." And though he tells us that "the movement is fairly progressing," his detailed illustrations of this progress seem to point the other way. Thus at Porrentruy and Delémont he found "very respectable congregations" of Old Catholics; but at both places the Ultramontane congregations were much larger, though turned out of the parish churches, and at Delémont deprived of the services of a priest altogether. At another place the intruded curé is so unpopular that on his first appearance he was stoned, but being "a man of stalwart frame, long resident in America," he stuck to his post, and "stalks" about with a revolver, having informed the Mayor (an Ultramontane) that he should hold him responsible for "any night assailant who fell under his revolver." It is consoling after this to be assured that "all is quiet now, however little the bulk of his parishioners relish his ministrations." A Protestant innkeeper in the same parish lost all his customers because this "stalwart" cleric had spent a few days under his roof. It would appear perhaps to ordinary minds a very natural use of words to call these proceedings persecution. But this is not the worst. Roman Catholics, as is notorious, attach great importance to receiving the last sacraments on their deathbed, and they cannot of course in conscience accept the ministry of priests whom they consider schismatics. Accordingly their only resource in the Jura is to seek the aid of their banished pastors, who hurry to and fro in mufti over the French border at the risk of certain imprisonment if they are caught. Mr. Hogg is greatly amused at this, and relates what, with a grim humour, he calls "a comical incident," which however narrowly escaped having a somewhat tragical termination. A sick man had sent for the ex-vicar, who crossed the frontier disguised in blouse and straw hat, administered the sacraments, and was returning, when two gendarmes recognized and pursued him. He was a quick runner, and succeeded in reaching the river Doubs, which forms the frontier, but there his strength failed him; he was collared on the bank and rolled into the river, which is deep, and as he could not swim, he was nearly drowned. However the gendarmes pulled him out and seized him, but as that part of the stream is wholly French water, the prefect was obliged to order his release. A state of things where dying persons can only receive the consolations of their faith by exposing the clergy who attend them to the certainty of imprisonment, if discovered, and to the risk of death, however "comical" to a joceuse imagination, is hardly mis-called persecution.

So far we have tested Mr. Hogg's estimate of "the conflict" by his own statistics. Whether he means it to apply to the Bernese Jura only or to the rest of the country he does not explain; but his argument would equally apply to the whole of Switzerland, as the Ultramontane clergy everywhere adhere to the Syllabus, which puts them, according to his conviction, out of the pale of toleration. Now Geneva is a much smaller canton than Berne, but much more thickly populated for its size, and the difference in the gross number of Roman Catholic inhabitants is not very considerable, for here, instead of one-eighth, one-half—47,857—are Catholics. It will be remembered that Father Hyacinthe—who is no milk-and-water opponent of the Vatican—recently threw up his cure with the bitter epigram that the Liberal Catholics of Geneva who had invited him "were neither Liberal in politics nor Catholic in religion." Into the correctness of the latter half of the indictment we need not inquire here, further than to observe in passing that it entirely coincides with the opinion expressed by intelligent and educated Protestant citizens of Geneva, who look at the matter altogether *ab extra*. The Old Catholic movement there, they say, is purely political and is abhorred by all Catholics who care a straw about their religion, and "Father Hyacinthe was obliged to leave them because he was too good for them." For the first half of his epigrammatic valediction at all events he had ample ground. All the Roman Catholic churches in Geneva but one have been handed over to the new sect; that one, Notre Dame, which was built entirely with Ultramontane money, the present Pope being one of the subscribers, it is now proposed to transfer to them also, and against the injustice of this proceeding Hyacinthe consistently protested as long as he had any voice in the matter. Moreover, it was resolved about two months ago to impose on all the clergy, on pain of immediate deprivation, a civil oath, which it was perfectly understood that no priest in communion with Rome would or could take. Twenty of these recalcitrants accordingly were deprived in one day, and all Ultramontane ministrations are now interdicted. It would be interesting to know whether Mr. Hogg considers "the word persecution, as applied to the conduct of the Geneva Government, simply a misuse of language."

The Old Catholic movement in Germany stands on a different footing. It was there really of spontaneous origin, and is not

backed up, as in Switzerland, by the whole weight of direct State support, though its leading representatives—always excepting Dr. Dollinger—have betrayed an unfortunate tendency to identify themselves with the persecuting policy of the Prussian Government, which has roused against them the suspicion even of the more religious section of the Lutherans. And it is certainly not uncommon to hear avowed freethinkers and indifferentists express strong sympathy with the movement. It is not easy amid conflicting statements to fix with any certainty the number of its adherents, but their own confidence is strikingly exhibited in the demand made at the Freiburg Congress for a religious census with the view of ascertaining to what proportion of the churches and Church property they have an equitable claim. If the demand is conceded, we shall be better able to test the value of their own estimate of themselves. Meanwhile the sharpness of the conflict is amusingly illustrated by an anecdote, for the accuracy of which we do not vouch, but which comes to us on the authority of the *Liverpool Mail*. All that can be said is that there is nothing in what we know from indubitably authentic sources to make the story at all improbable:—

A South German paper relates the following:—In a Bavarian town of the most pronounced Catholic orthodoxy the priest preached lately against the Old Catholics, and related such horrible things about them that his pious hearers were literally horror-stricken at Old Catholic impieties. At last the preacher cried out, "The Old Catholics are so vile that they will all be cast into the pit; and in what I tell you is not true, may the devil take me now on the spot!" His excitement was terrible; and he so struck the cushion that the book fell from it. Not far from the pulpit sat an American, who had a negro servant with him, to whom he beckoned to take the book up to the priest, who perhaps had never seen one of those sons of Ham in his life. The negro at once obeyed, and as he mounted the lowest of the pulpit steps the clergyman repeated his wish that the devil might come and take him if what he said against the Old Catholics was not true. Although the negro went very softly the preacher heard his footsteps, and turning round saw a black object solemnly, steadily, and surely approaching him. He looked at him with terror, and believing that he would in the next instant be collared by his Satanic Majesty, he cried out, with trembling voice, "It is, after all, possible that there may be good people among the Old Catholics!" Turning then round to see if the object had disappeared, he saw it still steadily approaching. The perspiration burst out on his brow, and full of despair he cried out, "There are even many good people among the Old Catholics!" Thinking that this would suffice, he turned round, but what was his horror to find that the object was close at hand. Imagining himself in the very grasp of Beelzebub, turning partly to the negro and partly to the congregation, he cried out, "May the devil come and take me if all the Old Catholics are not better than we are!" The terrified priest fainted from the fright, and it was only after some time that he recovered.

Let us hope at least that, if the religious war is to continue, methods of controversy, which remind one unpleasantly of the normal polemics of the Reformation period will not spread with it.

RICHARD COEUR DE LION AT DRURY LANE.

IT pleases Mr. Chatterton to state in his playbills that he has produced "a grand spectacular military drama" at Drury Lane Theatre, and we have little fault to find with this description, except that it might be better justified if he would have his crusading army more thoroughly drilled. Let us be fair to Mr. Chatterton and acknowledge that Macready, or even Garrick, would not have scrupled to produce a grand spectacular military drama if he had known how. The dresses would have been less splendid and the scenery less gorgeous, and the acting would have been considerably better. There would, however, have been this difference—that Macready or Garrick would not have thought a spectacle and a pantomime sufficient provision for an entire season of a theatre claiming to be national. We doubt also whether Macready would have entered into a competition with Astley's in which, if he had done no better than Mr. Chatterton, he would certainly have been worsted. The tournament in the last act of *Cœur de Lion* is, as an example of theatrical horsemanship, contemptible, and the dog's performance is nothing extraordinary. There is some ordinary tumbling and dancing which has as much or as little to do with this story as with any other. The part of King Richard is sustained by Mr. Anderson, whose excellent natural gifts are spoiled by a distressing propensity for mouthing and ranting. The part of Saladin is well acted by Mr. Creswick, whom the artists in costume have done their best to make ridiculous by getting him up as a cross between a mountebank and a chandelier. As for the acting of the other parts, the less said the better.

The novel of the *Talisman* is by no means the best that Scott wrote, but it is well adapted for conversion into a grand spectacular drama. To quote Scott's own words, "A name so dear to Englishmen as that of King Richard I. might contribute to their amusement more than once," whether in story or on the stage. There can be no question as to the superiority of *Ivanhoe* as a novel, but we hardly think it made a better play. The planting of the banner and its abduction make scenes which effectively impress the eye, and although King Richard is rather a boastful hero, it must be allowed that he never promised to friend or foe more than he was ready to perform. It must be remembered that Scott is not responsible for Mr. Halliday the adapter, nor for Mr. Anderson the actor, who roars as if he had the hearts and voices of fifty lions. But, looking to the tremendous character of this "impersonation," as the critics call it, we lament that Mr. Halliday did not pile up the horror a little higher by availing himself of Scott's notes as well as his text. The

best leeches of the camp were unable to cure the King's disease, but the prayers of the army were more successful. The King became convalescent, and the first symptom of his recovery was a violent longing for pork. If Mr. Halliday could be persuaded to compose a speech in which this phase of his hero's character could be exhibited, he may confidently entrust the delivery of his lines to Mr. Anderson. The mediæval poet whom Scott quotes has left this ground unoccupied. He confines himself to the speech of the old knight who suggests a means of satisfying the King's desire for pork. He proposes to take a Saracen young and fat, kill, skin, and boil him with spices, and when the King smells this cookery,

Out of ague if he be went
He shall have thereto good talent.

The word "talent" is here used in the sense of "desire" or "disposition," as in the motto of Prince Henry of Portugal, called the Navigator, *talent de bien faire*. The old knight's prescription was adopted. The King ate heartily of the food placed before him, and drank copiously, and lay down and slept, and fell into a sweat, and then

King Richard clad him and arose,
And walked abouten in the close.

He felt so well and in such good spirits that he took a turn at fighting with the Saracens, and then desired that "the head of that like swine" should be served for his supper. The cook pretended that he had not that head, whereupon the King expressed his feelings in a speech which we really should like to hear Mr. Anderson deliver:—

Then said the King, "So God me save,
But I see the head of that swine,
Forsooth thou shalt lessen thine."

The "eloquent aspect," as an American might say, of Mr. Anderson could scarcely be better exhibited than in declaiming these lines, nor could any living actor glare more awfully at the cook when that trembling wretch falls on his knees and cries

Lo, here the head! my Lord, mercy!

A thoroughly dramatic surprise is effected by the King's reception of the Saracen's head. He expresses neither anger nor disgust, but expatiates on the convenience of making war where the commissariat arrangements are thus at once simple and complete. He practically remarks that Saracen, after being killed, may be boiled, roasted, or baked, and that such dainty flesh may be picked to the bones. The commentators have omitted to observe that the adoption of the Saracen's head as a sign for inns has doubtless reference to the nutritious character of Saracen's flesh as proved by King Richard I., and that that sign ought to be accepted as implicitly announcing "chops and steaks," and as declaring that "cut and come again" is the character of the barker of the house displaying it. Mr. Halliday, in case he should think proper to introduce into his play this passage of the mediæval poet, might add a few touches which his audience would appreciate. He might make King Richard explain that Englishmen are the best soldiers in the world, but that they do not fight thoroughly well unless they are regularly supplied with roast beef or its equivalent; but now that an ingenious invention has surmounted all difficulty in the department of provisions, England will proceed to conquer the world, and her army will actually, as well as metaphorically, "chaw up" all other armies; so let us all sing "Rule Britannia," and if Austria or France takes a liberty with the British Lion, they will find that the great revenge of that noble animal has stomach for them all. As Mr. Anderson is confessedly the greatest living master of the "fa fe fo fum" style of oratory, we think that some effort should be made to provide him with a speech worthy of his unrivalled power. Perhaps, with some slight modification, the mediæval poem might be adopted by Mr. Halliday. The King has taken a town, and treats the garrison with cruelty. Ambassadors from Saladin come to intercede for the garrison, and the King invites the ambassadors to dinner and causes to be placed before each the boiled head of a countryman, which he sets them the example of eating with manifest appetite. He then bids them return home and tell their Sultan what they had seen, and assure him that it will avail him nothing to intercept the supplies of the Christian host, for no flesh is so nourishing to an Englishman as that of Saracen:—

For he is fat, and thereto tender,
And my men be lean and slender.

To England will we nought gon
Till they be eaten every one.

We are quite sure that Mr. Anderson could speak these lines so as to impress the house as it has not been impressed since Kean as Othello proclaimed his fury against Desdemona in the words, "I'll tear her all to pieces."

It is a pity that the equestrian talent of the theatre is not equal to representing the combat between Sir Kenneth of Scotland and Saladin with which the story opens. The Eastern warrior commences proceedings in a manner that would be as embarrassing to a stage warrior as it is to his antagonist. The inventors of tournaments fortunately contrived a mode of fighting which easily and safely adapts itself to theatrical purposes, but Saracens who transgress the rules of the game would be liable to compromise the safety of themselves or others. Accordingly, Mr. Halliday omits the combat with which the story opens, and only gives us that with which it closes. The playbill informs us that the dances, processions, and groups were composed and arranged by Mr. John Cornack, and

the machinery by Mr. James Tucker; but it does not appear whether either of these artists or some other composed and arranged the tournament, which at one moment assumes the character of a slow and solemn dance, and at another resembles those clock-work arrangements which tourists are expected to observe with interest at Berne or Strasburg. We observe, too, another and more serious omission in the playbill. We assume that the dog, who plays a leading part in this piece, belongs to a man, or, to speak more accurately, that a man belongs to the dog; but neither dog nor man is mentioned in the list of actors and other artists of the theatre. The barking of the dog may perhaps arrange itself under the head of music, and it is possible that the ballet-master may have "composed and arranged" the struggle between the dog and Conrad of Montserrat. We may remark, by the way, that those who "composed and arranged" the dress and general get-up of Conrad must be artists of considerable imaginative and constructive power. It is almost a pity that this splendidly attired leader of the Christian army should be decomposed and disarranged by a strong and unceremonious dog. Scott has taken so many liberties with history that he ought to submit to the liberties which Mr. Halliday and Mr. Clatterton have taken with him, but still it is going rather far to transform the deerhound, which was doubtless a portrait of one of Scott's own pets at Abbotsford, into a big shaggy animal of totally different breed, and perhaps of no particular breed at all. This intelligent and docile creature could doubtless learn to take money at the gallery door and to pull down the bearer of a bad shilling with the same unerring instinct with which he worries Conrad of Montserrat. He not only plays effectively a leading part in romantic drama, but he would also be able to make himself useful in pantomime, and that is more than we could venture to say for either Mr. Anderson or Mr. Creswick. At the risk of being accused of brutality and barbarism, we must confess that this "fight between a man and a dog" pleases us better than the solemn and calculated movements of the "tournament" which follows it. The "heroism of Richard" in the first act displays itself, so far as we can discover, only in his venturing to show himself to his army on the outside of a particularly shabby steed, who, if he came to a knacker's yard on his way to Jerusalem, would certainly be able to make himself at home there. We have said that the resources of the ballet-master and machinist and other artists were perhaps hardly equal to getting up a combat between Sir Kenneth and Saladin, but probably Scott's description of the Knight of the Red Cross "pacing slowly along the sandy Desert" might be realized by the cavalry of Drury Lane. It would indeed be quite another thing to expect to cross the Desert and reach the Holy City beyond; and if that be King Richard's expectation in the first act, we should recommend him to give one more example of his strength by carrying his horse, which certainly will never carry him. The musical director and the ballet-master, not having the fear of Cardinal Cullen before their minds, have conspired to produce a "procession of priests and nuns" which only too faithfully represents an actual religious ceremony of the Roman Catholic Church. "The interior of the Chapel of Engaddi" has been praised as "an effective view," and probably the Manager thinks that when he has got a good piece of work from Mr. Beverley, the more he exhibits it the better. So not only does the procession proceed to considerable length, but when it is over, the chapel is cleared for a "meeting between Sir Kenneth and Edith" in which Mr. Halliday shows that he can write sentimental small-talk "all out of his own head," as schoolboys say. The *Talisman* is one of the last and weakest of the series of *Waverley Novels*, and when Mr. Halliday undertakes to supply the gaps which he thinks he discovers in Scott's work, we begin to perceive that in the lowest deep there may be a lower deep of literature. After the procession, and the love-making, and the ranting and roaring of the King, and the meek docility and leaden footsteps of the war-horses, the spectator, oppressed with heat and glare, may perhaps realize in his own person the feelings of Sir Kenneth as he toiled at noontide over a sandy desert, and may even venture to regard the palm grove and fountain at which the Knight rested as typical of the smoking-room and brandy and soda-water of his club.

REVIEWS.

SULLY'S SENSATION AND INTUITION.*

WILLIAM BLAKE said in one of his lucid flashes, "What is now proved was once only imagined." It is strange that the mystic to whom the very name of Newton was an abomination should have thus struck out with one word the true secret of the history of science. Not only does the work of the imagination enter largely into the forms of our most exact knowledge, but the way of those who prove and establish is ever being prepared before them by those who imagine and suggest. We speak not of such wild fancies as may come into any man's head, but of imagination guided by a certain scientific insight that foresees in what directions proof is likely to advance. At this day a wide field is open to the explorations of the advanced guard of science in regions which we have become accustomed to look upon as destined to fall under her rule, but which cannot be

* *Sensation and Intuition: Studies in Psychology and Aesthetics.* By James Sully, M.A. London: Henry S. King & Co. 1874.

thoroughly occupied and subdued for a long time to come. In the essays now before us we have a good example of this kind of work. It too often happens that intuition and interpretation fail to go together. The fruit of insight is lost to the world for want of knowledge, or for want of insight knowledge has to deal with experience at secondhand. No such fault is to be found here. The materials furnished by a quick and lively natural sense are happily ordered by a mind trained in scientific method. This merit is especially conspicuous in those parts of the book where, with abundant ingenuity and no mean success, Mr. Sully endeavours to throw some light of cosmic order into the chaos of æsthetics. Unhappily for our present purpose the best qualities of the work are precisely those to which we cannot do justice within the limits of a review. An instance will best show our meaning. In the essay on Musical Expression Mr. Sully says in effect that music may be considered in one aspect as an idealized translation of vocal expression, and in another aspect, at least in its more complex forms, as a symbolic representation of the complexities of human consciousness (compare Mr. Browning's analysis in *Alt Tøtler* and elsewhere). Now such general analogies presented by themselves may at once strike the reader as ingenious, but one might frame other wholly different ones which at first sight would look equally well. The true value of these consists in their being founded on groups of particular facts in musical expression which have been rightly observed and rightly put together, and the character of this groundwork can be appreciated only by careful reading of the whole essay. However we cannot do less, though we would fain do more, than give Mr. Sully's statement of his general results in his own words:—

In contrast to the first crude tentatives in song, aiming at nothing higher than a slightly intensified embodiment of a definite emotion with its attendant ideas, the complex music of the modern symphony appears to be a grand translation of the common vocal utterance of feeble men and women into a noble and sublime language, such as might be spoken by natures of a finer mould than ours, whose emotions and thoughts take grander proportions, and move in more orderly sequence. Under another aspect, these fine structures of tone seem to transcribe into abstract symbols the most general aspects and relations of all emotional life, and thus to image in vast dim outline the whole world of human feelings, not in detached fragments, but in the most perfect order of rise, complex development, and final subsidence in a deep satisfying rest.

We may quote another passage in which he explains and justifies that vagueness of all musical expression which is sometimes counted a defect:—

What is lost in definite transmission of individual emotion is more than made up in vague transmission of vast groups and strata of feeling. A delicate and subtle melody taken from some musical classic does not, it is true, profess to be a very exact paraphrase of one distinct flow of feeling; yet, by its numerous half-hidden affinities with vast series of vocal expressions, it is able to stir deep and complex fountains of emotion, slowly distilled out of wide tracts of experience. It is this depth and quantity of emotion evoked by music, together with the mind's inability to define it as any familiar variety, which constitutes the infinity of the art, and accounts for its mighty subjective influence.

It should also be observed that this essay is in part founded on materials brought together with great care in the two foregoing ones, entitled "The Basis of Musical Sensation," and "Aspects of Beauty in Musical Form." We can dwell no longer on these two than to say that they are full of interest, even for readers who have no technical knowledge of music.

The same method of construction is somewhat more clearly and compactly shown in the tenth and eleventh essays. Under the head of "The Æsthetic Aspects of Character" Mr. Sully considers the conditions by which human character is fitted to afford æsthetic pleasure to an observer. Having done this, he starts in the next essay from the point thus attained, and goes on to discuss "The Representation of Character in Art." We mention a few of the special points touched on. The artistic usefulness of characters which in real life would be painful is accounted for by a "nascent impulse of retaliation" in the spectator. There are some very just remarks on the relations of art to morality. Mr. Sully allows on the one hand that many qualities which give æsthetic pleasure have no moral significance, and on the other hand he exposes the mistake of those who "have sought to banish from the region of art every vestige of moral rule." The sense of right, he says, together with the sentiment of moral esteem, is a constant element of the cultivated mind, and "the gratification of moral feeling must always be included in a calculation of the total pleasurable effect which a given character is fitted to produce on a cultivated spectator." In the following essay he analyses the construction of characters in the drama and the novel. We are glad to find amongst other things that he assigns a good reason why truth to nature is less required in comedy and light fiction, and justifies from a scientific point of view the charming paradoxes by which Elia defends the artificial comedy of the Restoration. The last essay of the volume is on the "Possibility of a Science of Æsthetics." It is well pointed out that such a science must be to a great extent historical, and that one of its chief objects must be to discover "those large and abiding tendencies which are discoverable in the advance of culture as a whole." It is obvious from Mr. Sully's sketch of the matters which such a science would have to deal with that it will take a very long time to construct. In the meanwhile it is shown what good an art critic may find in trying to look at things in a scientific way:—

If it does nothing else, a study of the deepest principles of art may help him to be less dogmatic, to qualify by a deeper reflection the best judgment which a few minutes' observation may have produced. It will teach him that every great work of art is a many-sided complexity, appealing to

numerous shades of feeling, all of which can scarcely coexist in full intensity in a single mind. It will suggest to him that because of this greater complexity in the higher æsthetic sentiments, a less complete measure of agreement is to be looked for among the opinions of the cultivated than among the crude admirations of the unreflective.

We pass now to the other division of the book. Mr. Sully's "Studies in Psychology," though less novel and striking than his experiments in extending scientific methods to æsthetics, are by no means without importance. The essay on "The Relation of the Evolution Hypothesis to Human Psychology" contains some not untimely warnings. Mr. Sully accepts the hypothesis in general, but he thinks there is just now some danger of rashly calling in ancestral transmission to explain mental phenomena which with a little more thought we might find to be adequately explained by individual experience. He also thinks that the study of psychology as understood by the last generation or two of English thinkers, as, for instance, the Mills and Grote, is by no means supplanted by the theory of evolution. The new conceptions may serve to explain some of the data which psychology must assume, and may forbid us to think of any of them as absolutely constant. But there will remain a large body of practically constant facts of human nature, for whose separate study there is still good reason and ample room. Mr. Sully concludes with a protest against attempts to restore the credit of what are called the natural beliefs of mankind by making them out to be ancestral "quasi-intuitions." For why should not fallacies of the mind's own making be transmitted by inheritance as well as the truths of experience? Indeed one would think it almost self-evident, were it not so often overlooked, that the evolution hypothesis has no direct bearing on any purely metaphysical questions, and cannot answer them either way. Mr. Sully sees this point clearly enough, perhaps more clearly than he finds occasion to say.

In the essay on Belief Mr. Sully has a very obscure problem to deal with, of which he does not pretend to give a complete solution. He thinks the germ of belief is to be sought in the transition from sensation to idea. We may suppose an idea to produce "a mental impulse to realize the corresponding sensation," in other words a crude form of belief. This is gradually transformed by the lessons of experience into "anticipation of a conditioned result," or "assurance of a past reality," as the case may require. Mr. Sully's suggestion may seem fanciful, but there is much to support it. Even in the mature mind, as he points out, the presence of an idea, though it be of our own construction, disposes us to believe in the outward reality of a corresponding thing. This tendency shows itself in the scholastic doctrine of universals, occult qualities, and the like, to which we take leave to add that mediæval occult quality with a modern face which is called the Absolute, the Unconditioned, or the Unknowable. Upon this last Mr. Sully seems to look with a very wholesome unbelief.

It is well known how Dr. Johnson, who could cut a matter short when he chose, cut short the Free-will controversy with the crushing sentence, "We know we are free, and there's an end on't." No direct answer can be given to this; the most that can be attempted is to show how Dr. Johnson and others may have come to feel so sure that they were free, and this is undertaken by Mr. Sully in the chapter entitled "The Genesis of the Free-Will Doctrine." Assuming the belief in an indeterminate will to be wrong, he seeks to explain how it arose. He assigns a variety of causes, among which, besides purely intellectual tendencies and the complexity of the phenomena themselves, are the emotions of pride and the love of mystery and the reaction of popular language on thought. In the account of "Recent German Experiments with Sensation" we have an interesting exposition of some late results which have not hitherto been brought together for English readers. The contents may not indeed be new to students of physiology for its own sake, but they will be so to many of those who take, or ought to take, account of physiology for the sake of its bearing on the problems of sensation and thought. The minuteness of the observations is curious. Thus the *minimum audibile* has been determined as the sound made by a piece of cork, weighing one milligram, falling through one millimeter on a glass plate, at a certain small distance from the observer; and although no absolute measure can be found for the eye's sensibility to light, yet what is called the discriminative local sensibility of the retina has been very closely fixed. It is found that a difference of less than one two-hundredth part of a millimeter in the position of two images on one retina or of corresponding images on the two retinæ produces a distinct effect in vision. In the whole of the experiments on sight Mr. Sully finds new evidence in favour of accounting for our notion of space by experience, and that the experience of the individual rather than of ancestors. Our space will not let us do more than barely mention Mr. Sully's review of Mr. Spencer's and Mr. Darwin's theories as to the expression of the emotions, and the ingenious argument in which he upholds the place of moral self-culture in an empirical system of ethics. Throughout the essays we find the true scientific virtues of abstinence from dogmatism and care in discerning (to return to Blake's aphorism) that which is proved from that which is only imagined.

As to the manner of the book, Mr. Sully writes well, and so as to be understood by any one who will take the needful pains; yet the writing is not clear and straightforward enough to be wholly to our liking. Our present English writers on philosophy, with some few brilliant exceptions, are too apt to fall into a cumbrous

and involved style, and to bring in new terms or turns of speech where they are scarcely wanted. Mr. Sully does not altogether avoid this common fault. It is indeed no less hard to speak clearly of subtle things than to see them aright, but the greater is the reward of him who can do both. We are wiser in sundry ways than our fathers, but not yet so much wiser that we can afford to forget either the speculative insight or the classical English of Berkeley.

THE LAST QUEEN OF SCOTS.*

LIKE the figure in the wax-work show which by a change of dress could be made to do duty either as a murderer or as a monarch, the last Queen of Scots is alternately placed before us as an angel or as a fiend by her several historians. This difference of opinion extends to the minutest details. They are not at one as to the colour of her hair, or even as to the dress which she wore on the scaffold. In fact, no two portraits of this hapless Queen, whether drawn by pen or pencil, are alike. Yet the chief events of her life are well known. Her own letters and those of her correspondents have been placed within the reach of all readers by the painstaking researches of diligent investigators. With such resources at command for judging of her character and for getting some insight into the spirit of the times in which her lot was cast, it does seem strange that there should still be two distinctly marked lines of opinion as to the motives which prompted her actions, and as to her guilt or innocence of the crimes laid to her charge. But, as has been well said, the spirit of the times in most cases means the spirit of men's minds in which the events of the time are mirrored; and in no page of history is this truth more strikingly set forth than in the treatment which Mary Stuart has met with at the hands of her numerous biographers. The number too of those biographers, the warmth with which her claims have been discussed by persons of all classes and of divers nations, lend an almost prophetic significance to her own assertion that she stood before the theatre of the world. This Queen who languished away eighteen years of the prime of life in the dull dreariness of obscure English country houses has since her death become the theme of song, the heroine of tragedy, and the unfailing subject of historical controversy. That an interest so universal and so inexhaustible should have been felt in her fate seems incomprehensible if we consider the place which she occupied in the political world. This Princess, though in one sense a Queen from her cradle to her grave, had an actual reign of but six years. Her kingdom was a small, remote, and but half-civilized State, which until that time had been little involved in European politics. It is true that she was looked upon as heir presumptive to one of the most powerful sovereigns in Europe, and was taken prisoner by her in time of peace. But if we leave out of sight the relationship between the two Queens, such a seizure was the natural result of the policy which England had for centuries followed out towards her less powerful neighbour. To lay hands upon the King of Scots whenever and wherever he could was the all but openly avowed design of the King of England. The first James was captured and kept in time of truce, and the fifth James only escaped a like fate by his prudence in declining all his kind uncle's pressing invitations to meet him on English ground. Had the barque which bore the baby Queen to France not been enabled by fair winds to give the English cruisers the slip, Mary Stuart would in all likelihood never have reigned, and her fate would have met with no more pity than did that of Arabella Stuart, or of any of the other victims whose only crime was having too much royal blood in their veins. But it is not merely because she was beautiful, gifted, and a Queen, that she has had so many defenders and accusers. It is rather because her whole history was so closely bound up with the religious strife which was then stirring the minds of men, and which was at the bottom of all the tumults and bloodshed that occurred in every State of Europe. Because Mary was a Romanist, and we believe a sincere Romanist, therefore every member of her Church feels bound to maintain that she died a martyr for her faith, instead of seeing that her death was the almost unavoidable result of the line of conduct that she had pursued in estranging her subjects and throwing herself with her eyes open into her rival's power. Elizabeth could not have let her escape alive out of her hands without having the Puritan party up in arms against her. They clamoured for her death, and long before it came they were fretting and fuming that the Queen did so "dandle the Catholics."

To the difficulties of Elizabeth's position Mr. Hosack does full justice. In this his second volume he takes up the story in the middle of the alarms caused by the Northern risings, and carries it on to the death of the Queen of Scots. He examines and sifts very thoroughly and impartially all the plots and counterplots of which she was at once the centre and the object, and lays bare all the threads of the web of treachery and double-dealing in which she was enclosed. Mr. Hosack attaches great weight to the discovery recently made of the dispensation for the marriage of Bothwell with the Lady Jane Gordon, the existence of which proves that Mary never was his lawful wife. He argues that the Queen must have been ignorant of the

existence of this important document, because it was the interest of the three persons most concerned in the matter to keep it secret. Bothwell himself had the best of reasons for wishing to keep it concealed; his wife, who was most desirous to be released from her worthless husband, would also find it expedient to do so; while the Archbishop by whom it had been granted dared not reveal its existence, for fear of getting into trouble for having dissolved the marriage. No doubt these were weighty reasons for secrecy at the time of the divorce, but they did not exist at the time of the marriage. As to obtain a dispensation before a marriage was the custom, there could have been no inducement to make a mystery about it. The Queen, too, it must be borne in mind, had been the maker of the match, and why should it then be supposed that she was kept in ignorance of the precautionary measure that was to make the marriage bond more sure? There were others in Scotland, too, who knew of the dispensation. Buchanan openly proclaimed it, and was for long accused of lying in so doing. In reality, the existence of the dispensation was of but little import, for Bothwell's first wife was then living in Denmark, and reclaimed her runaway spouse when he made his reappearance in that country. Of this first marriage both Lady Jane and the Queen were alike ignorant.

With regard to the Casket Letters, Mr. Hosack has found out that several alterations have been made in the despatch sent by the English Commissioners to Elizabeth after their examination of the letters. The erased passages can still be deciphered, and the despatch with these passages as first written, and as they stood after they had been amended, is printed in the Appendix. We find there also a collection of very interesting letters and documents now given to the public for the first time. The originals are in Blair's College, Aberdeen; but they were first placed in the Scots College, Paris. These letters, which were deciphered by the late Dr. Kyle, bring to light certain friendly overtures made to the Queen of Scots by Morton when Regent. That he entertained any hopes of a reconciliation with the Queen, for whose death he had shortly before been plotting with Cecil, has been hitherto unknown and unsuspected. But we here find him offering to do his utmost to further her restoration. This remarkable change of policy on the part of the Regent is made known to Archbishop Beaton in a letter from the Lord Ogilvy, who tells how Morton had come to him and "spoke very reverently and with great honour of the Queen." He declared himself ready to "do all things that lay in him for restoring the Queen's majesty to her former estate and honour, and said further he would be able to deliver her the most part of her jewels, and quhairony waitit to show in quhair hands they war." All this, however, was only on condition "that the Queen would forgait and put in oblivion things past." The sincerity of the proposal was vouched for by Sir James Balfour, who also came to Lord Ogilvy and assured him that all that the Regent said was true, and "repentit the samin in affert and mekil maner." This letter is dated April 16, 1577. Morton's overtures were not met half way as he doubtless expected. Perhaps Mary and Beaton were both too thoroughly acquainted with his character to be willing to "forgait and put in oblivion things past," for the sake of securing so very slippery an ally till he should have given some proof of his sincerity. Before he had an opportunity of doing so his enemies had got the upper hand, and he lost his head for the part he had played in compassing the death of the "gentyl Henry." It would have been well for Mary if she had been equally suspicious of some other offers of service, though it cannot be doubted that if she had kept clear of the snares that were spread to lure her into plotting against Elizabeth's life, some other pretext would have been found for shortening her own. Unlike many of the admirers of the Queen of Scots, who seem to think that they cannot vindicate the fame of one Queen without blackening that of the other, Mr. Hosack does full justice to the character of Elizabeth. He lays much of her dissimulation and double dealing to the charge of her Ministers, and makes every allowance for the difficult circumstances in which she was placed. He even gives her credit for sincerity in her professions of affection and sympathy for her de throne cousin. He acquits her in great measure of the blame of the cruel persecutions of the Romanists which disgraced her reign, or at least of taking a personal pleasure in their torments. In the case of Campian and his fellow-victims, for instance, Mr. Hosack reminds his readers that these men's lives would have been spared if they would have consented to listen to a Protestant sermon. In that case we cannot help thinking their death lay at their own door, for though to be preached at in a Protestant sermon would doubtless have been a painful penance, it was better than being cut in pieces alive, and it could have done no lasting injury to either their souls or their bodies. In his concluding remarks Mr. Hosack cites several of the distinguished men who have been convinced of Mary's innocence. To add Dr. Johnson and John Wesley to a list containing such names as Camden, Carte, and Lingard is more likely to weaken than to strengthen his case. We cannot see why John Wesley should be supposed more competent to judge of Mary's history than she would have been to decide on the merits of his theology. As he makes the mistake of supposing Bothwell to have been seventy years old at the time of his marriage with the Queen, it would seem as if he had not gone deep enough into the subject to give weight to his opinion. As for Dr. Johnson, he was a thorough Cockney at heart, and had all a genuine Cockney's prejudice against Scotland and its inhabitants. That prejudice made him quite incapable of understanding the very peculiar relations which existed in that country between the King and the people, and

* *Mary Queen of Scots and her Accusers.* By John Hosack, Barrister-at-Law. Vol. II. Blackwood & Sons. 1874.

Histoire de Marie Stuart. Par Jules Gauthier. Paris. 1869.

History of Mary Queen of Scots. Translated from the Original and Unpublished MS. of Professor Petit by Charles de Flandre, F.S.A., Scot. London: Longmans & Co. 1874.

therefore of judging of Mary Stuart's merits as a Queen. Certainly, had they chanced to jostle each other in life, we question whether the slovenly ways and plain speeches of the great lexicographer would have been more relished by the Queen than were the uncourtly rebukes of John Knox himself. Nor can we imagine a greater contrast than that between the idle frolics that were so much in favour at Holyrood and the highly intellectual diversions of the Happy Valley. But, as a woman, Mary was lovely, charming, and in distress, and that was enough to enlist the gruff, mannerless old man who was not without a spice of gallantry, in spite of his churlish bearing, among the number of her chivalrous defenders.

Among this gallant corps we must also place M. Gauthier. He takes up the cause with all the zeal of a new convert, for he himself tells us that he was formerly strongly prejudiced against Mary Stuart. This prejudice was dispelled by a visit to Scotland, and so repentant was M. Gauthier for this error of judgment that he felt moved to take up his pen in her defence. But he has not taken it up in haste nor without needful preparation. He has visited all the scenes of Mary's life. Not only has he seen at Holyrood the blood-stains on the Palace floor, and at Hamilton the casket which once held the famous "Letters," but he has sailed upon Loch Leven itself, and has had his feelings worked upon by a sentimental old boatman who had named his boat after the captive Queen. More than this, he has also busied himself for ten years in carefully searching out all the records and documents bearing on the case wherever they were to be found, either at home or abroad. In the Simancas Archives he has made what he looks on as a very important discovery bearing on the authenticity of the "Casket Letters." This discovery is a letter from Guzman de Silva to Philip, written in July 1568. It recounts a conversation between Murray and the Spanish Ambassador. Murray gave out that he was doing his utmost in behalf of his sister, but said that it would be hard to prove her innocence because of a letter that had been found from the Queen to Bothwell, and signed by her own hand, which betrayed a plan for stopping Darnley in a "house by the way," and for setting fire to the house in case the poison did not succeed. The letter also contained advice to Bothwell for getting rid of his own wife:—"Dandole algun boveda con que muriese." This must of course have been one of the letters in the "Casket." And yet the account here given by De Silva does not tally with the contents of any of them. In none of them is Craigmillar spoken of as the "house by the way," nor do they contain any mention of the plan for getting rid of Lady Jane. M. Gauthier thinks it also a very significant circumstance that Murray here only speaks of one letter, and that he afterwards produced eight, and that he should speak of the letter as signed with her own hand, while none of the letters actually produced bore any signature. This seems to us to be evidence on the other side, for, had the letters been forged, the same hand that had written them would not have scrupled to add a signature also. As for the Ambassador's letter, it could scarcely be accepted as conclusive evidence, as it is scarcely possible that he could remember the conversation word by word as it fell from the lips of Murray. But M. Gauthier is willing to find proofs of Mary's innocence everywhere, even in the inconsistencies of the Acts of the Scots Parliament. He has, however, written an excellent history, in which he shows a thorough knowledge of his subject and a thorough acquaintance with the history of Scotland, and with the state of parties there at the period of which he treats, which were scarcely to be expected from a foreigner. His style is easy and picturesque, and his book, though the work of a strong partisan, is free from any invective or abuse of the opposite side. It forms a worthy companion to the History of M. Mignet, and ought to be read along with it by every Frenchman who wishes to form an impartial judgment of the history of that troubled time. Wherever it was possible, M. Gauthier has

laisé parler les acteurs qui occupent la scène, persuadé que leur parole, surtout dans un sujet aussi controversé, aurait plus d'autorité que celle de l'historien.

The third book on our list bears a motto given by the Empress Eugénie on the title-page, and "heartfelt" thanks addressed to her in the preface. The contents are much such as we should expect to find in a book published under such patronage. The author is clearly an abject worshipper of princes and of Courts, and a blind believer in the divine right of kings and queens to sin with impunity. He sees in Mary a second Margaret, bent heart and soul on working a second reformation in manners and religion among her unruly subjects. The "fiddling and flinging" which roused the ire of John Knox are, in his eyes, politic measures for civilizing and softening a half-savage people; and the raid on the Gordons is an excursion into the Highlands prompted by Mary's love of the picturesque, for "the mountains and lakes, the rivers, meadows, and forests of the Highlands all seemed to attract her." As for her subjects, M. Petit treats them as a set of lawless ruffians, too turbulent to be ruled by their angelic Queen. To be sure he does lay their guilt to the charge of their religion, and explains how since the Reformation the Scots Lords were "far from particular how they got rid of their opponents"; also that "subjects become Protestants set themselves up as judges of the Government—Mary Stuart was the first victim." We advise M. Petit to refresh his memory of Scots history by reading the stories of Lander Bridge and of Bannockburn, of the fate of the Tutor of Dunbar, and of the way in which it was avenged, and he will learn that the

right of the subject to call in question the actions of the sovereign was no new doctrine, and that in times long before the Reformation both sovereign and subject had been "far from particular as to how they got rid of their opponents."

M. Petit professes to have written his book for the benefit of thoughtful men, but we should think it more likely to find readers among sentimental school girls. They will be charmed with the long accounts of all the fine doings at Mary's first marriage, and moved to tears by the picture of the captive Queen devoting herself to rearing doves and little dogs, instead of being involved in all sorts of political intrigues. His book may be more aptly styled an *éloge* than a history. His idea of womanly excellence corresponds with that of the bereaved husband who summed up the enumeration of his wife's virtues with "She painted on velvet beautifully and of such is the kingdom of heaven," for he draws attention over and over again to Mary's skill in fancy work as though it added lustre to all her other gifts and graces. He describes with the minuteness of a connoisseur the raiment of needlework which she from time to time presented to her cousin, and declares it to be "touching to see her doing her utmost to enhance the already faded beauty of Elizabeth." In this charitable work M. Petit certainly does not lend a helping hand, for he does his utmost to make Elizabeth seem hateful and despicable. Nor can he see in the conduct of the English Queen anything but mean spitefulness towards a fallen rival for whose blood she was thirsting.

In the works of Mr. Hosack and of M. Gauthier we have now pretty nearly all that can truthfully be said in Mary's favour. Mr. Hosack pleads her cause with the talent of a skilful advocate, convinced himself of the innocence of his client, and bent on making it patent to the world. M. Gauthier proclaims her wrongs with the chivalrous devotion of a Frenchman who has pledged himself to vindicate the honour of a charming woman. But still, in spite of all that her defenders may urge, there are certain ugly facts in her history that remain to bear witness against her. The doom passed on the friendly House of Huntly; the honours granted with a lavish hand to her husband's murderer; the mockery of justice in his trial; and finally, the marriage into which she rushed, in direct defiance of decency and prudence, are blots upon her history which make it of comparatively little moment whether the famous "Letters" are genuine or not. No doubt they were evil days in which her lot was cast, and her early education at the Court of France had not been the training best suited to fit her for governing her own people. But among that people there was a strong feeling of affection for the royal race whose representative she was, and by their clamorous welcome they displayed their goodwill to her in their own rough way. Had she been a man all would have gone well. She had all the gifts which had made some of her line so popular. The ready wit, the easy manners, the open hand, and above all, the dauntless spirit and contempt of danger which she showed as she rode at the head of the royal raid, would in a king have been more than sufficient to cover any blemishes of private character. A king might have got rid of half-a-dozen wives if he pleased with impunity, for the world tacitly accepts the doctrine that

The unconquered powers
Of precedent and custom interpose
Between a King and Virtue.

But from a queen men look for better things.

RALSTON ON EARLY RUSSIAN HISTORY.*

THE number of lectures published after delivery to an audience is already over large, and of some at least we may say that the lack of them would be no cause for regret. But among these the present volume is certainly not to be included. It deals with a subject of which English readers generally know little or nothing, and of which historical students will be glad to have a survey from one who has made it his own. Mr. Ralston is at home in the literature both of the Russian people and of Russian scholars. He has laid before the English public much of their songs and their folk-lore, and these he has examined with the scientific precision both of the comparative mythologist and of the historical critic. This task was a fitting preparation for the present sketch of early Russian history, in which the several stages of a political growth singularly unlike that of the Teutonic nations are traced with sufficient fulness, and in a spirit at once generous and impartial.

The form of the work is very simple. The matter of the four lectures has been rearranged in seven chapters, of which the first six relate the chief events in Russian history to the crowning of the first Romanoff, while in the last only the author examines critically some points which have been, or still are, matters of controversy. He admits, in fact, that his aim has been to trouble his readers but little with his own opinions, while he does his best "to lay before them the judgments, on vexed questions, of the best and most recent among Russian historians"—a task not slight when we look at the large mass into which the historical literature of the country, springing up but as yesterday, has already grown.

Mr. Ralston's sketch would have been more complete if he had drawn out more thoroughly the points of contrast and of likeness between the fortunes of the Russian people and those of their Western neighbours. If among them, as elsewhere, we have from

* *Early Russian History*. Four Lectures, delivered at Oxford, in the Taylor Institution. By W. R. S. Ralston, M.A., of the British Museum, &c. London: Sampson Low & Co. 1874.

the first a certain kind of unity which it was seemingly impossible utterly to destroy; if, from the loose and undefined confederations of earlier days, with their natural result of civil strife and war, there arose gradually something like a central power, still we cannot but mark the vastness of the time over which the process was extended, the tremendous obstacles which stood in its way, always retarding and sometimes apparently crushing it, and the strange anomaly which exhibits in its latest stages features belonging only to the earlier conditions of Teutonic society. The Russian system as it was worked under the Tsar Nicholas claimed for itself an authority which had no reference to time. The Tsar was more than the Caliph of Islam. He was the representative, not of a prophet, but of God himself. A power thus exercised becomes soon surrounded with an air of antiquity; and in the eyes of strangers, not less than of the Russian people generally, the two most prominent features of Russian life, the autocracy of the Tsar and the bondage of the serf, seemed to have their foundations in the very nature of things. Yet they are the growth of a time which would carry us but a short way back in our own history; and in the ages which preceded it there was much in the political conditions of Russian tribes to justify expectations of very different results.

If Mr. Ralston has not cared to dwell specially on these points of contrast, he has furnished all necessary materials for those who may wish to note them, while the clearness of his arrangement brings order and meaning into what might seem a mere chaos of intestine wars, and of yet more hideous disasters from invasions of savage hordes. During no small part of these periods the national unity seems wholly lost, while the reader may well turn away bewildered from the monotonous series of crimes and calamities which seem to make up the history whether of the rulers or of their subjects. But Mr. Ralston shows a path through the labyrinth by pointing out the fact that the earlier history of the Russian people is, practically, the history of four great cities—Novgorod, Kiev, Vladimir, and Moscow; the first of these representing the era of loose confederation between members which, for all purposes of government, were wholly independent and often antagonistic; the second and third marking the more developed federation between princes whom the system of appanages tended nevertheless to sunder and impoverish; the fourth rising to power as the city of Tsars who had seen that the only way of securing Russian unity was by destroying all local independence, and who set about the work with the determination of enslaving every municipality within the Russian boundaries. To the four cities must be added the fifth, founded by the man who made Russia an aggressive Power, and committed it to the course which to this day excites in many minds the darkest fears for the future of Western Europe.

The history of Novgorod, although reaching back for little more than a millennium, is wrapped in the mists of popular tradition, to which Mr. Ralston assigns no more than its proper value. The stories which illustrate it are at least more entertaining than the gloomier narrative of the more important annals of Kiev, in which the evils of the appanage system leave the country defenceless against aggressors who, even to a thoroughly united people, must have been, in all likelihood overwhelming. The theory that every descendant of Rurik had a right to an appanage showed its power for mischief when the sons of Yaroslav I. passed from a state of feud into open warfare, leaving to their successors an inheritance of perpetual discord, until Kiev itself, sacked by an army led by ten Russian princes under Andrew, lord of Vladimir, ceased to be the chief city of Russia. But if the supremacy now passed to Vladimir, the history of this city did but repeat that of its fallen rival, in spite of ominous signs of disaster from without. The Russian people were, in fact, threatened from all sides. Poles and Hungarians towards the south, Lithuanians to the west and the north, constantly menaced or crossed their borders, until the penalty for intestine wars was more fully exacted by the roving hordes set in motion by Genghis Khan. Preceded by the ravages of less formidable bands, the storm burst upon the country in all its fury in the days of Batu, the grandson of Genghis, who destroyed the still splendid city of Kiev and swept on westward, until meeting at length with a check, he fell back on the banks of the Volga, and there founded the great city of Sarai.

The account of these Tartar inroads and of the domination which followed them is perhaps the best part of Mr. Ralston's book. The new condition of things acted powerfully on the character both of the Russian princes and of their subjects. The one end of Tartar rule was money; and so long as this was obtained the conquerors gave themselves no trouble about the religion of the conquered or the mode in which they might choose to govern themselves. But whether in the first stage of the conquest these exactions were enforced by Tartar officials, or afterwards were left to the Russian princes themselves, the results for the people were much the same. The chief who had to kneel and kiss the dust in the presence of the great Khan soon learnt to balance these indignities by inflicting indignities still more unseemly on his subjects; while, having become himself the tax-gatherer, he was tempted to squeeze out for his own benefit sums vastly exceeding the demands of the conquerors. But among these princes were some men endowed with no small sagacity or cunning, men quick to take advantage of divisions among their enemies, to ally themselves with one horde of Tartars against another, and to strengthen the federal connexion for which their predecessors had cared so little. The result generally was to exalt the power of the chiefs, and to

sap the spirit of independence among the people. But there was yet another influence working perhaps still more powerfully for the same end. Against the waves of conquest which swept over the land the only barrier could be furnished by a patient fortitude, based on a trust in Divine help, when that of man had failed utterly. This immovable trust it was the first object of the Russian Church to foster to the uttermost; and the work was done effectually. But when Mr. Ralston speaks of the priceless services rendered by the Russian Church to the Russian land even during the darkest period of its history, we may doubt whether his picture be not somewhat overcharged with colour. The devotion of Russian rustic congregations may be great; but it has its dark as well as its bright side. If the clergy taught the people that no disasters were to weaken their faith in God, they taught them not less that this faith must be shown by unquestioning obedience to the chief who was his Vicar, no matter what might be his oppression or his crimes; and Mr. Ralston himself brings out the mischief thus wrought when he tells us that the servile form of allegiance paid from the first to the Muscovite Tsar was partly due to the teaching of the Church:—

Great as had been the merits of the clergy in supporting the courage of the nation when all but crushed under the feet of the Infidels, so do their demerits appear to have been great, in that they inculcated a perfectly blind obedience, an utterly abject submission, to the orthodox Chief of the State.

Yet it is not easy to draw the line between these two parts of their teaching. In either case their religion was passive, and if it kept up a spirit of inert resistance, it checked and killed the spirit of sturdy independence which in England has had its reward in the growth of constitutional freedom. Such teaching could not fail to have political as well as moral results; and the result was seen when, if the tale be true, the Tartar Boris Godunov was suffered to place on the necks of the peasants that yoke of serfdom under which we might perhaps have expected to find them in the days of St. Vladimir, but which they ought to have shaken off finally long ago. Mr. Ralston says rightly that the moral tone of the Russian people had undergone a most unfavourable change, and this change left the way open for that humiliation of the common folk which marks the age of Boris Godunov, if it be not the work of Boris himself.

So great indeed has been this change, and so inveterate the servility which has grown out of it, that it is hard to look on Russia as the land in which the burghers of Novgorod and Pskov so long and so steadily maintained their freedom. Barely three centuries have passed from the time when the Votche, or general assembly, of the Novgorodians had the power of judging, deposing, and expelling their prince or chief. But the weakness of the national bond had insured the fall of national freedom. The assembly of Novgorod resolved to transfer its allegiance from the Muscovite prince to the Polish king; and the penalty of defeat was the suppression of their Parliament, while the bell which had summoned them to their councils was carried away to Moscow. The same lot befell the cities of Pskov and Tver, and nothing remained to check the divine authority of the Tsar. The strange shiftings exhibited in the course of Russian history during the last four centuries may possibly be followed by changes not less surprising in a future which even now may not be far distant.

HISTORY OF THE GRENADIER GUARDS.

(Second Notice.)

THE history of the Guards shows the origin of the existing British army. King Charles II., while in exile in Flanders, formed a regiment of Guards out of the loyal gentlemen who had fought for him in England, and employed it in the service of Spain against France, which was assisted by Cromwell. At the battle of the Downs, as it is called, near Dunkirk, in 1658, Turenne, with the help of the Republican English, defeated the Spaniards, and the Royalist English save more than their own honour on that disastrous day. Thus, to the close of Cromwell's life, his army remained invincible. But when he was gone, and the King regained his own, that army was gradually superseded by regiments officered by Cavaliers who had survived Marston Moor and Worcester. When the King returned to England in 1660, he left behind him in Flanders the regiment of Guards which had fought at the Downs. One of his first steps was to raise a regiment of Guards in England, of which John Russell, of the house of Bedford, was Colonel. Shortly afterwards the regiment raised in Flanders was brought to England by its Colonel, Lord Wentworth. Thus there were two regiments of Guards, one older in point of time, the other first on the English establishment. Evelyn describes a review of both these regiments, with other troops, in Hyde Park in 1663. "The troops," says he, "were in extraordinary equipage and gallantry, consisting of gentlemen of quality and veteran soldiers, excellently clad, mounted, and ordered;" and he particularly mentions that the old Earl of Cleveland "trailed a pike, and led the right-hand file of a company of foot commanded by his son, the Lord Wentworth, a worthy spectacle and example, being both of them old and valiant soldiers." Shortly afterwards, the death of Lord

* *The Origin and History of the First or Grenadier Guards, from Documents in the State Paper Office, War Office, Horse Guards, Contemporary History, Regimental Records, &c.* By Lieut.-General Sir F. W. Hamilton, K.C.B., late Grenadier Guards. 3 vols. London: John Murray. 1874.

Wentworth enabled the King to amalgamate these two regiments of Guards into one, of which Colonel Russell took command. The army which the King found subsisting at his restoration had been by this time disbanded, except one regiment, the Coldstream, of which the Duke of Albemarle was Colonel. Out of favour to him, *per quem stant ipsi reges*, as his epitaph in Westminster Abbey states, and also as a security against apprehended riots, this regiment was retained in the King's service, and became the 2nd or Coldstream Guards. At a later time a regiment of Scots Guards was brought upon the English establishment, and formed the 3rd or Fusilier Guards. The proportion of musketeers to pikemen in a regiment was about 7 to 5; the musketeers wore red coats, and the pikemen buff coats, and in appearance the uniforms of that day contrast favourably with those of the existing Guards. Some troops of Life Guards and the Oxford Blues were raised about the same time, and shortly afterwards Lord Dumbarton's Scotch regiment was transferred from the King of France to the King of England, and became the 1st Regiment of the line or Royals. The next in order was the 2nd Queen's or Tangier regiment, of which Percy Kirk was some time colonel, and the next was the Holland regiment or 3rd Buffs. Other regiments were added by King Charles II. and his successor, and thus in spite of the jealousy of Parliament a regular army was established and maintained.

The earliest warlike service of the First Guards after the Restoration was on board the fleet which fought several battles with the Dutch. About the same time they were employed in keeping order and attempting to subdue the flames at the Great Fire of London. They were sent repeatedly to Flanders, where they fought with equal valour for the French against the Dutch and for the Dutch against the French. In 1678, after a fierce fight between the British regiments in the Dutch service and the French, the brigade of which the First Guards formed part, commanded by Lord Howard of Eserick, was ordered to advance from Brussels, where it lay, to Turbise, south of Hal. A truce prevented the expected battle which would otherwise have found place near Waterloo. Throughout the history of the Guards, Ostend, Bruges, Ghent, and Brussels are mentioned almost as frequently as any English towns. In that very year, 1678, the Guards took up their winter quarters at Brussels. Next year a detachment of Guards was sent to Tangiers, and remained there until that costly possession was abandoned. In 1681 Colonel Russell resigned the command of the First Guards and was succeeded by the Duke of Grafton, a natural son of the King. The Guards served King James II. faithfully against the Duke of Monmouth, and perhaps if there had been any officer to lead them against the Prince of Orange, they might have followed. But their Colonel, the Duke of Grafton, joined Marlborough in his defection, and the Guards, after some useless marches and counter-marches, found that no effectual orders came from the King, and had no choice but that of submitting to the Prince. For a few days the command which had been abandoned by the Duke of Grafton was held by Henry Lee, Earl of Lichfield, the head of that house to which, it is believed, the ancestor of General Robert Lee belonged. But the Earl of Lichfield followed his master into exile, and the Duke of Grafton resumed command of the corps, which had now become the Guards of King William III.

The soldiers were disgusted at the inglorious part which they had been made to play in the Revolution, and the new King quartered them in provincial towns while he confided the duties of the capital to his Dutch guards, whom he could fully trust. Gradually, however, King William III. and his English troops found that they could heartily agree in animosity to the French. The Duke of Grafton was soon removed from his command, which was now given to a devoted adherent of King William III., Henry Sidney, afterwards created Earl of Romney. Early in 1691 a battalion of the First Guards landed in Holland, and it took conspicuous part in seven hard-fought campaigns which followed. By this time the bayonet had been largely introduced, but a certain proportion of men in each company still carried the pike. The Earl of Romney, having been appointed Secretary of State, resigned the colonelcy, which was given to Charles, second Duke of Schomberg, son of the first Duke of Schomberg, who was killed at the battle of the Boyne. This second Duke of Schomberg was killed in a battle near Turin, and thereupon the Earl of Romney resumed the colonelcy. In these campaigns both King and army developed that eminently British quality of not knowing when they were beaten. At the battles of Steinkirk and Lander the King was outgeneraled by Luxembourg, but when that officer was dead, and when the resources of France began to fail more rapidly than those of the allies, the balance turned in favour of the persevering Dutchman and the obstinate British troops which formed the backbone of the alliance. The part taken by the Guards in the celebrated siege of Namur is lucidly explained in these pages, but we will not dwell upon an exploit which, although our forefathers regarded it with justifiable complacency, was almost forgotten in the greater glory of the neighbouring field of Ramillies, as that also was in turn displaced from national memory by the more recent and momentous conflict of which the scene lies a few miles further off at Waterloo. It is interesting to note that while the siege of Namur was in progress the covering army of the allies took up the position of Waterloo, and there awaited an attack which the French did not make. The Peace of Ryswick, and the consequent reduction of the British army, was shortly followed by the breaking out of the Succession War. King William died in the midst

of military preparations, and his trusted friend and counsellor Henry Sidney, Earl of Romney, did not long survive him. Thus the Duke of Marlborough, shortly after he became generalissimo of the allies, succeeded to the colonelcy of the First Guards, in which regiment he had received his first commission more than thirty years before. In the very year, 1704, in which he became colonel, he led a battalion of the regiment with other British troops from the Meuse to the Danube, and gained with them the splendid victory of Blenheim, which "saved the Austrian Empire, and for the time destroyed the power of France in Central Europe." After this battle the First Guards marched to Mayence, and descended the Rhine in boats to Maestricht, where they went into winter quarters.

After the campaign of Blenheim all the remaining services of Marlborough were performed in Flanders or the adjoining territory of France. He found the French army in 1705 occupying lines which stretched from the Meuse below Namur to Antwerp. These lines he forced. In 1711 the French army occupied lines between Bouchain and Arras, which they confidently declared to be the *ne plus ultra* of Marlborough. These lines also he forced "by one of the best examples of strategy ever carried out in the presence of so large a force of the enemy." He was much congratulated by the Ministers at home, who said that, "without losing a man, he had gained an advantage which would have been reckoned as cheaply bought at the expense of several thousands." The very next page of this history to that from which these words are quoted records that on the last day of the year 1711, in which the lines of Bouchain were forced, Marlborough was deprived of all his offices, including the colonelcy of the First Guards. In the next and last year of the war the British contingent was commanded by the Duke of Ormonde, who also succeeded to the colonelcy of the First Guards. His instructions obliged him to abandon Prince Eugene, whom the French thereupon attacked and defeated at Denain. As the British Guards marched to the coast they found themselves excluded with insult from the very towns which they had helped to capture. Such a close to an unbroken series of victories was inexpressibly humiliating. In these pages, which scarcely touch politics, Marlborough appears only as the triumphant leader of ten campaigns, who never made a mistake nor incurred a check, whose successes were only limited by the stupidity and obstinacy of his allies, and who invariably kept at his headquarters a battalion of his own First Regiment of Guards. It is satisfactory to know that one of the first acts of King George I. was to restore Marlborough to his offices of Captain-General of all the forces and Colonel of the First Guards. He held the colonelcy till his death, and he was succeeded by his trusted friend Cadogan, who had been Quarter-Master-General of his army. After Cadogan came Sir Charles Wills, a veteran of the wars of King William III. and Queen Anne, and on his death in 1741 the young Duke of Cumberland became colonel of the regiment which, as general of an allied army, he put in the way of acquiring a large share of barren and costly honour at Fontenoy and Laufeldt. The Duke of Cumberland was almost uniformly unsuccessful as a general, except in his campaign in Scotland. After the capitulation of Closter-Seven in 1757 he resigned both the command of the army and that of the First Guards, and he was succeeded as Colonel by Sir John Ligonier, of French Protestant extraction, of whom it is recorded that "at Dettingen he had been created a knight-banneret on the field, at Fontenoy he had commanded the infantry, and at Laufeldt he had headed a desperate charge of cavalry, when he was taken prisoner." There could not have been a more suitable selection of a commander for an eminently fighting corps. While he was Commander-in-Chief of the army and Colonel of the First Guards, a battalion of that regiment served in Germany under a brigadier bearing the redoubtable name of Julius Cæsar, and it was stated, with undeniable truth, that "the British troops were always placed in the warmest part of every action" in the campaigns which they made in defence of the Electorate of Hanover and the Principality of Hesse Cassel. The brigade of Guards was in the division of General Conway and the corps of the Marquis of Granby, while the whole allied army was efficiently commanded by Prince Ferdinand of Brunswick. This arrangement was eminently satisfactory to our ancestors. Our soldiers got what is vulgarly called "a bellyful" of fighting, and at vast expense of blood and treasure the Electoral dominions of the King of England were preserved, and he and his ally the King of Prussia fought a fair stand-up fight against the three greatest Continental Powers. Everybody was pleased. The British found all the money and got plenty of hard knocks. Visitors to Homburg may perhaps learn with surprise that they are close to the scene of many hard-fought battles in which British troops served as well and as successfully as at Blenheim or Waterloo, although their services have been well nigh forgotten. In all these campaigns the French pushed nearly north-east from Frankfurt-on-the-Main, through Cassel towards Hanover, while the allies strove to drive them back on Frankfurt and the Rhine, and ultimately succeeded.

It may conduce to clearness to recapitulate in order of time the Continental campaigns of the First Guards in the eighteenth century. The Succession War began in 1702, and in that year and the next the First Guards were with Marlborough's army on a line which nearly corresponds with the present frontier between Holland and Belgium. In 1704 the regiment marched up the Rhine to Mannheim, and thence to Ulm on the Danube and to Blenheim, which is close to Donauwörth. From 1705 to 1712

almost all the fighting of what we will call the Grand Army of the allies took place in the country which may be roughly comprised between two railway journeys, one from Ostend by Antwerp to Liège, and the other from Ostend by Lille to Namur. In 1743 King George II. found himself with an English and German army at Aschaffenburg, on the Main, above Frankfurt. In marching down the right bank of that river towards Hanau he was met near Dettingen by the French, whom he defeated. The unsuccessful campaigns of 1745-7-8, including the battles of Fontenoy and Lauffeldt, occurred on that same Flemish ground where Marlborough had been so often victorious. The campaigns of the Seven Years' War, in 1760-2, in which the First Guards bore part, were chiefly transacted in the triangle formed by Frankfurt, Cassel, and Gotha. The Succession War employed the First Guards in Spain, as well as in Germany and Flanders, and throughout all these wars a series of expeditions, generally abortive, were undertaken to the French coasts, in which the First Guards were creditably, but not gloriously, employed. After the termination of the Seven Years' War, in 1762, the regiment was not again sent abroad until, in 1776, the revolt of the American Colonies caused an army to be assembled at New York. The campaigns which followed in America, and those of the long war with the French Republic and Empire, are more familiar to the modern reader than those upon which we have now dwelt. The gallant veteran, Lord Ligonier, died in 1770, and was succeeded in the colonelcy by the Duke of Gloucester, brother to the King, an inexperienced young man, who held that post until 1805, when he was succeeded by the Duke of York, son of the King, an experienced but unsuccessful soldier. The Duke of York held the colonelcy until his death in 1827, and he has been followed by the Duke of Wellington, the Prince Consort, and the Duke of Cambridge. Thus the claims of royal birth and of military eminence have been allowed to prevail about equally for this command. It is often difficult to decide whether our military successes are gained by our system or in spite of it; and if we doubt whether Colonels of Royal blood have done much good for the First Regiment of Guards, we may at least feel sure that they could not do harm to it. Whatever may have been the fortunes of the armies to which it has been attached, the conduct of the regiment has been always worthy of the corps which stormed the Schellenberg at Donauworth and defended the Château Hongoumont at Waterloo.

LOST FOR LOVE.*

EVEN in Miss Braddon's poorest writings there has usually been an indication of qualities which tempted one to hope that some day, if she would only do herself justice, she might produce a really good story, not indeed one of the highest class, yet good within its range. She has a direct and vigorous style, a quick eye for outward character, and some skill in the development of a tangled plot. She occasionally has a real hold on the scenes and characters she describes, and the frank straightforwardness of her narrative in itself commands attention. On the other hand, unfortunately, her works have hitherto been discoloured by an unpleasant vulgarity of tone, and by eagerness to snatch at easy effects obtained by cheap sensational expedients. It might be supposed, however, that these defects were in a great degree due to the haste with which a rapid succession of stories had been composed, and the inferior audience at which they were aimed; and there was still room to hope that, if Miss Braddon would make the effort, she might do something very much better than anything she had yet achieved. It was in this hopeful mood that we opened *Lost for Love*, and we were glad to find, as we read on, that there seemed to be encouragement for it. Nothing can be more simple and unpretending than the beginning of the story. We are introduced to a dull, sombre, highly respectable house in Wimpole Street—a doctor's house of course. Dr. Ollivant, the occupant, has at thirty-six years of age acquired a great practice by sheer hard work and exclusive devotion to his profession. He had resolved as a lad to be successful, and his life has been given up unreservedly to this single object. He is cold in manner, has "dark solemn eyes," and "premature gravity hung upon him as a garment." Although a fashionable physician, he even recoiled with his mother, who keeps house for him. After a laborious day, he dines with the old lady, and then shuts himself up in his study with his books. It is easy to understand what is going to happen when this solemn personage is suddenly brought into contact with a pretty, bright young girl, full of vivacity and sunshine. He is first amused, then interested, and, before he knows it, over head and ears in love. Mr. Chamney, the young lady's father, is suffering from heart disease, and wishes to see his daughter provided for in case of his death. He proposes to make Dr. Ollivant her guardian, and also favours the addresses of a young artist, Walter Leyburne, in whom he is interested. Leyburne presents the necessary contrast to the Doctor's "dark solemn eyes" and premature gravity. He is "a bright-looking young fellow with an expression as radiant as a summer morning, blue eyes, straight Greek nose, light auburn moustache with drooping ends sedulously twisted, only half-concealing a somewhat feminine mouth, auburn hair, worn long in Raffaele fashion;" and he has a handsome fortune, left him by an old uncle, to back his artistic aspirations.

This situation, though perhaps not particularly novel, is portrayed with a good deal of cleverness, and, what is more remarkable in Miss Braddon, with self-restraint. She is content to work with quiet, simple touches, and the characters, though rather slight and shadowy, are interesting. We feel as if we had got sole beyond the sphere of paroxysmal passion and sensational incident, and prepare ourselves for the enjoyment of a domestic idyl. Of course the Doctor is jealous of his rival, but he suppresses his feelings, and even assents with becoming resignation when the marriage is finally arranged. An experienced student of fiction instinctively knows what to expect when he finds Papa ready with his blessing in the early part of a story. Another figure is now added to the scene. This is Loo Jarred, a character upon whom the author has evidently bestowed a good deal of pains. Loo's father is a professor of the art of doctoring pictures and violins for the Wardour Street market, and Leyburne, who, as an artist, might be supposed to know better, has somehow dealings with him, and is fond of going to his dingy manufactory to vapour about art. Here he meets Loo, is struck by her wild, neglected beauty, and resolves to make her the subject of a great picture, to be called "Lamia;" and the acquaintance thus begun quickly ripens into a dangerous intimacy. Leyburne is not only fascinated by the "dark grand eyes, the ivory paleness of cheek and brow, the full crimson lips with their perfect curve, the loose, shadowy hair," but he undertakes to "redeem the imprisoned soul from bondage," in other words, to teach Loo to appreciate the beauties of Keats, Shakespeare, Byron, and even Eschylus. We must confess that when we got to the grand dark eyes and full crimson lips we began to fear that we were getting back to some of the familiar delicacies of Miss Braddon's early style. It should be understood, however, that this novel is conducted on principles of the strictest propriety, and that Walter and Loo are equally unconscious of the perilous entanglement into which they are straying. One night, on their return from a rather late excursion, Walter finds his companion thrown on his hands by her father, who refuses to have anything more to do with her; and it must be admitted that this is rather an awkward situation for a young gentleman who is already almost engaged to another young lady. Walter behaves in the most honourable way, sends Loo to a respectable boarding-school, and then—which is not perhaps quite so honourable—goes down to Flora at the seaside, and at a hint from her father, proposes marriage, and is accepted. Nemesis follows him in the shape of old Jarred, who accuses him of carrying off his daughter, and demands that she should be given up. Dr. Ollivant happens to overhear the conversation, challenges Walter with his perjury to Flora, and threatens to expose him. Words come to blows, and all at once, without expecting it, we are in for the great sensation incident of the drama—the tremendous header that brings down the gods:—

The Doctor, wretched, the painter made free use of his fists. For some moments Walter had the best of it, till, feeling himself losing ground, the Doctor called science to his aid, and planted a blow on his antagonist's temple which sent Walter reeling backward, helpless and unconscious. Reeling backwards on the sunburnt slippery sward that edged the cliff—backwards until, with a wild cry of horror, the Doctor saw him sink below the verge.

When we reached this point we felt that we had indeed been made the victim of misplaced confidence. The quiet and sobriety of the earlier chapters were only the torrent's smoothness ere it dashed below. The peaceful domestic idyl had suddenly been transformed into a sensational novel of the ordinary type. It is possible that Miss Braddon may have originally intended to work out the development of her characters under simple and natural conditions, and that she found the task too trying for her powers, and in desperation fell back on the familiar expedient. Or perhaps the scene on the cliff may have been premeditated from the first. In any case it is a confession of artistic incapacity. Anybody can contrive an incident of this kind, but it is a very different thing to portray the gradual unfolding of character and the action and reaction of mutual influences on a group of persons under the conditions of real life. The supposed murder—for of course Walter turns up again—is the climax of the story, the point to which the author has been artfully working up, and afterwards she can do nothing but go down again. Given a grave, intellectual, high-minded man, who has suddenly been the means of killing a fellow-creature by a blow, and it is easy to conceive what scope there should be here for a subtle analysis of the remorse and terror which would succeed. But Miss Braddon is apparently too conscious of her incapacity for this higher work to make even a faint attempt at it. Here are the Doctor's reflections on the supposed destruction of his rival:—

The Doctor looked back along the summer waves. Somewhere under that blue water Walter Leyburne was swaying gently to and fro, entangled among sea-weeds perhaps, and with cold anemones cleaving to his hair, lulled as gently by that soft murmur of ocean as ever his mother rocked him in her arms. To-night or to-morrow might come wind and storm, and the same waters would tear and buffet him, and shatter him against the rocks in their frantic sport; but for this evening he could scarcely have a pleasanter resting-place than that cool blue sea.

"Better than to be stretched in a narrow coffin, and shut up in a room that all living things avoid," thought the Doctor.

Meditation on the "cold anemones cleaving to the hair" of a murdered rival is certainly a wonderful touch. It is needless to go any further into the story, towards which Miss Braddon herself now seems to grow careless and indifferent. She has accomplished her "header," and the rest of the book goes merely to make up the conventional three volumes. The early part of the tale shows, or at least suggests, what she might per-

* *Lost for Love*. A Novel. By the Author of "Lady Audley's Secret." 3 Vols. London: Chatto & Windus. 1874.

haps accomplish if she were capable of the labour and self-denial which would be involved; the rest of it proves clearly enough that, whatever her natural capacity may be, she prefers to sink to the level of the lowest class of novel-readers. A description of life in Voysey Street, where the Jarreds dwell, occupies a considerable part of the book. Voysey Street is of course an exceedingly vulgar place, full of vulgar people, and it may be said to be appropriate that the picture should be also redolent of vulgarity. A genuine artist, however, would surely have contrived to relieve by some lighter touches the dull coarseness of such a passage as this:—

Their ambitions and desires are all bounded by Voysey Street, and the court where the celebrated pork-butcher turns his sausage-machine. If they grew rich—a contingency remote to the verge of possibility—they would make no eager rush to Prince's Gate or Park Lane. They would only riot in the luxuries of Voysey Street; sup continually on tender pudding, and wallow in the humbler varieties of shell-fish.

Here is an example of Miss Braddon's sense of humour and fidelity to nature, an old clothes-woman's criticisms on art:—

"Give me the old masters, Mr. Leyburne," she would remark in conclusion, "without meaning any disrespect to you. But don't tell me about your Millises, and your Belmores, and your 'Olmans' Tents. Give me the old masters. Look at the tone and mellowness of 'em, everything subdued down into a beautiful rich brown, and as smooth as a mahogany table. Why, if you put your nose against one of them Millises it's as rough as a gravel path, all the paint laid on in splottles and ridges, as if it had been painted with a curry-comb. Give me a Rembrandt, or a Vandick; there's as fine a tone in one of their Holy Families as in a Stradivarius violin."

And Leyburne keeps up the conversation in this style:—

"Life, madam," replied the painter, who always affected a certain ceremoniousness in his converse with the lady: "he has been compared to a forward child, which must be rocked in its cradle, or nuzzled with Daddy's Elixir till it falls asleep; a comparison, oddly enough, to be found verbatim in the works of three distinguished writers—Sir William Temple, Voltaire, and Goldsmith."

"Ah!" said the matron sententiously, "there are some children that don't get Daddy's Elixir. It is all vaccination, and measles, and rubarb-powders for some of us."

By the way, Miss Braddon seems to have borrowed from Mr. Mortimer Collins the habit of attending closely to the creature comforts of her characters. The old clothes-woman is "conciliated by Melton-Mowbray veal-and-ham pies, washed down with copious draughts of Edinburgh ale." Walter's visits to Voysey Street lead him to acquire "a depraved appetite for liver and bacon and sausages and tripe"; "a bottle of iced Moselle and a gooseberry tart, with a jug of cream," form a conspicuous feature in the country excursion which he and Loo take together; and even the delicate Flora is despatched to a picnic with "a neatly-packed basket, containing a pigeon-pie and a pound-cake, a punnet of big scarlet strawberries, and a bottle of cream, with other bottles, et cetera, which made the basket rather heavy." The next step will be perhaps to substitute a *menu* for the poetical quotation at the head of each chapter. On the whole, *Lost for Love* is more disappointing than most of the same writer's books, not because it is worse, but because it encourages by its beginning hopes which it afterwards rudely dispels. The story is full of the wildest improbabilities, and the characters are little more than lay figures with descriptive labels attached to them. It must be said, however, that there is a rough vigour in the tale which distinguishes it from the ordinary insipidity of current fiction.

WOOD'S ECCLESIASTICAL ANTIQUITIES OF LONDON.*

THIS book is thoroughly disappointing in every way, but it attempts to supply what is really very much wanted—namely, a special guide to the few existing remains of mediæval antiquity in London and its neighbourhood. There is unfortunately not much that has survived the wreck of time; and we fear that a good deal of what does remain will disappear in the course of modern improvements, in spite of the more intelligent appreciation of the past which characterizes our own generation. It is but a few months ago that the ancient Gothic crypt below the chapel of Lamb's Almshouses, occupying a bastion of the old London Wall, was recklessly destroyed by the Clothworkers' Company. The garden of Drapers' Hall is not a mediæval antiquity; but it is an interesting relic of old London, and its open space is invaluable as a lung to the crowded city; but that is doomed as we write. It is a bad prospect indeed for archaeology when the old City Companies no longer jealously preserve their old inheritances. We have often wished to see just such a book as Mr. Alexander Wood has here attempted; and our vexation is the greater that a most desirable object has been so inadequately and unsatisfactorily carried out.

Mr. Wood's particular fault is that he does not distinguish between what actually remains of mediæval churches and what may be found out as to the former history and splendours of what once existed. It is easy enough to extract from Stow, or Malcolm, or Nicholl, or Godwin, or even from Dr. Pauli's *Pictures of Old England*, descriptions of formerly existing religious foundations; but what is really wanting is a guide to such fragments of London before the Fire as may still exist. Again, Mr. Wood confuses the mere memories suggested by certain names of places with what his title itself describes as the object of his book—namely, the Ec-

clesiastical Antiquities of London. Thus the mention of Holborn suggests the sufficiently pathetic account of the execution of Holford and Genings, two Roman Catholic priests, in the year 1588, for the offence of saying mass in a private house, near Gray's Inn Fields, belonging to a Mr. Swithin Wells, who was himself also hanged, drawn, and quartered for harbouring these ecclesiastics. Mr. Wood is an enthusiastic convert to Roman Catholicism, and he naturally, we suppose, thinks these and other equally cruel executions infinitely worse in kind and degree than the burning alive of Protestants in Smithfield. Thus he describes at length the burning of Friar Forest in Smithfield, while the numerous executions in the same place under Mary are briefly dismissed in the sentence, "here the bloody scenes under Mary took place." Now no such records can be fairly called ecclesiastical antiquities. Mr. Wood distinctly says in his preface that his book is "architectural and antiquarian only." For our own part we view with equal horror and disgust all religious persecution, whoever may be the victims, and even if the pains and penalties inflicted are less than the gibbet or the stake; but we make equal allowance for both sides in times past, when religious liberty was a thing not understood.

Having said so much in disparagement of this volume, we may now turn to its better features. Mr. Wood's scheme is to divide London and its suburbs into nine walks, and to notice as he goes along what ecclesiastical ruins or remains are to be found in each neighbourhood. Thus, his First Walk, starting from Holborn, passes to Clerkenwell, the Charterhouse, London Wall, Austin Friars, and by Cornhill to the Tower. An alphabetical order would have been, in our opinion, infinitely to be preferred, but we must take the author's plan as we find it. He tells us, we observe, that the ruins of the "Templar church," "circular and built of Chert stone," were found a century ago where Southampton Buildings now stands. He gives, however, no authority for the statement, and we may say here, once for all, that his references are almost always indefinite and useless. The beautiful but degraded remains of Ely Chapel are of course mentioned. But here, as indeed always, Mr. Wood's descriptive powers are of the lowest. He does not make his readers understand what it is that remains of ancient date, nor does he tell them what to observe, and how to gain access to the places named. Since he wrote, Ely Chapel has been bought, it is understood, by some Roman Catholic clergymen, who mean to restore it to its ancient use. No one can regret the preservation of so lovely a fragment of mediæval work. We hope it will be "restored" with judgment and feeling. Speaking of Christ's Hospital, Mr. Wood may be pardoned perhaps for dwelling on the past glories of the Grey Friars' Church which once occupied its site. It was a church three hundred feet long, and in some respects almost a rival of its near neighbour, St. Paul's. Truly mediæval London in its glory must have been a very paradise of ecclesiastical architecture. Our author declares that "there are some scanty remains of the cloister" of the Grey Friars. We never heard of them, and should have been very glad to be told where to find them. Mr. Wood's description of the noble fragment that is left to us of St. Bartholomew's, Smithfield, is jejune in the extreme. He ought to have told us where to look for the east wall of the church of the Knights Hospitallers of Clerkenwell—*de fonte clericorum*—with its "Middle Pointed" crypt, with octagonal piers and groined arches." Another famous London well, the *fons sacer* of Holywell Street, is said, by the way, to have been found in the recent excavations for Mr. Street's Law Courts, and we are told that its stream is both abundant and pure, and that it will be made use of in the new Palace of Justice.

Mr. Wood again does not inform his readers in what street Carpenters' Hall is to be found, but he says that the hall of this Company retains on its west wall four distemper paintings of the date of Edward IV., all of them pertaining to the carpenter's trade. These are, the Building of the Ark, Josiah ordering the repairs of the Temple, St. Joseph and the Divine Child working in the Carpenter's Shop, and Our Lord being called in the Synagogue the Son of the Carpenter. Few of our readers, we believe, have seen these pictures, which nevertheless—if they really exist—deserve a place in the history of English pictorial art. The very beautiful nave of the Austin Friars, dating from 1354—a model for a large modern parish church—is of course noticed by our author, but not with discrimination. In fact, Mr. Wood seldom or never ventures upon any criticism of the buildings which he describes. This church now belongs to a congregation of Dutch Calvinists, but the congregation has almost dwindled away. We thoroughly agree with our author in his dictum that All Hallows, Barking, is the most complete mediæval parish church remaining in London. This interesting church, which is close to Tower Hill, is not half so much known as it ought to be. St. Olave, Hart Street, is another ante-Reformation church, but it is of small interest. There are two most curious ancient churches remaining in Bishopsgate—namely, St. Ethelburga and St. Helen's. We find nothing whatever new in Mr. Wood's account of the Tower or of St. Saviour's, Southwark. He has an ambiguous joke on the modern nave of the latter church, which we may quote as a specimen of our author's dreary humour:—"The nave may be sought for by him who should seek the Santa Casa in Laluanin or at Nazareth. Has it then been removed? No, it has been translated into the churchwarden's [sic] gothic of 1840." Let us express our regret, as we are mentioning this noble church, that it was not determined to substitute a more seemly nave, and generally to restore it, as the cathedral of a new see, as a fitting monument to the late Bishop Wilberforce.

* *Ecclesiastical Antiquities of London and its Suburbs*. By Alexander Wood, B.A. Oxon., of the Somerset Archaeological Society. London: Burns & Oates. 1874.

Of the famous abbey of Bermondsey nothing is said to remain except a fragment of wall in the churchyard of St. Mary Magdalene's church. That church, however, possesses a very curious salver of the time of Edward II., representing a castle and a knight kneeling before a lady, who is placing a helmet on his head. Is it true, we wonder, that in the steeple of St. Mary le Bow, Wren preserved the old Romanesque arches and used them to sustain his new superstructure? Our author makes the assertion; but, such is the imperfection of his style and the inaccuracy of his observation, that we never can quite tell how to understand him. When we come, in the course of Mr. Wood's Fifth Walk, to St. Paul's, we find an unconscionably long description of the ancient cathedral, with copious extracts as to the functions, ritual, and customs of the place, with notices even of the relics supposed to have been preserved there, all borrowed from Hook's *Church of Our Fathers*, and other like sources; but not a single word as to the few monumental fragments of the former church still preserved in Sir Christopher Wren's crypt. Coming westward, we find that the present Rolls Chapel is asserted to be, in its structure, a building of the early part of the thirteenth century. It is curious enough, considering who the present Master of the Rolls is, that this chapel was originally the "Domus Conversorum et convertendorum de Judaismo ad fidem Catholicam." Mr. Wood tells us nothing new about the Temple. He says that the base of the tower of St. Clement Danes in the Strand is Gothic. We may notice here that in the recent restoration of St. Andrew's, Holborn, the Gothic remains of the tower have been cleared out and renewed; while St. Sepulchre's, across the valley, but now brought very near to the last-named church by the Holborn Viaduct, has very recently been restored to its Gothic character in its tower with the south porch and parvise over it. It is strange that Mr. Wood should still think *Chère Reine* the possible origin of the word Charing. But scholarship is not his strong point; and we have doubted in turning over his pages whether he or his printer ought to be credited with the misprints of his Latin quotations. As in the case of St. Paul's, so with Westminster Abbey, Mr. Wood deals more with the details of the ancient customs and glories of the past than with the existing fabric. Strange to say, he does not even seem to be aware of the great antiquity of the so-called chapel of the Pyx. Here is one architectural judgment in which we are glad to be able to sympathize with our present author. Speaking of the exterior of Westminster Abbey, he says:—

It has frequently been proposed to remove St. Margaret's, as obstructing the view of the abbey. As a matter of fact, nothing more enhances the grandeur of the abbey than the neighbourhood of the humble parochial edifice. It is altogether a mistake to suppose that a large mediæval building was intended to stand detached. Were Westminster Abbey arranged as Wells Cathedral, or York, or Lincoln, the chapter house would stand on the site of St. Margaret's; and it would not then be proposed, we presume, to remove an integral part of the building. M. de Montalembert said: "They (the English cathedrals) often strike more at first sight (than the French), precisely owing to this encircling, whose inferior proportions make those of the central monument tell more." M. Viollet-le-Duc was much opposed to the removal of St. Margaret's.

Attention has lately been called in the public journals to Sir Thomas More's Chapel or chantry in Old Chelsea Church. Mr. Wood says that the chancel of this church is of early fifteenth-century date, and that the capitals of the piers in the arch which separates this chancel from More's aisle are "of rich Renaissance work, almost too rich and delicate to be English of that date; and that, as they appear to be insertions, they are not improbably of foreign workmanship." Other suburban churches which are of mediæval date, or retain portions of mediæval work, are Fulham, Putney (the tower), Chiswick (the tower), Barnes (containing fragments of Early Pointed style), Mortlake (the tower and the font), Brentford (the same), Twickenham (the tower), Kingston (wholly of Middle and Third Pointed date), Old St. Pancras (a shell of the twelfth century, but hardly distinguishable under Gough's tasteless "restoration" of it), Hornsey (the tower), Finchley and Hendon (both Third Pointed churches, the latter retaining a Romanesque font), Stepney (built in 1440), Stratford (an ancient structure), and Hackney (the tower).

This volume is very inferior in every way to such a book, for example, as Sperling's *Church Walks in Middlesex*, which was published some years ago. The ground is still open for a guide to the existing remains of mediæval architecture in and near London; and we hope that some competent architectural critic will before long supply the want.

SCOTTISH RIVERS.*

IN one sense this may be termed a posthumous work. A little more than a quarter of a century ago, Sir T. Dick Lauder, on a sick bed from which he never rose, wrote a series of papers in *Tait's Magazine* on the Rivers of Scotland. They have now been published in a connected form, with a good index, a very few illustrations, and a short preface by Dr. John Brown, the well-known author of *Rab and his Friends*. We are quite willing to credit Sir T. Lauder with all the amiable qualities and sterling virtues ascribed to him by personal regard. He was a man of considerable acquirements, warm feelings, and elegant tastes. He came of a good Scotch family, more than one of whom, in former times, had

made himself a great name in the law. He produced in his lifetime several works in which the tone and colouring of Walter Scott were imitated with considerable success. His politics were Liberal without being destructive; and his position, as the owner of Fountainhall, and as Secretary to the Board of Manufactures and Fisheries, brought him in contact with Jeffrey, the Wilsons, Lord Cockburn, Scott himself, and others the most eminent of that generation in their respective lines. He appears to have lived a happy, useful, and honourable life; and he died a death as instructive and edifying as a whole shelf of sermons. *Bonum virum facile diceres*. *Magnum liberum* would scarcely be applied to him even by the most partial of associates and admirers. But he appears to us an excellent type of that valuable class whose influence in their social circle, and in politics to a certain extent, is productive of nothing but good. Of elevated sentiments and of keen sympathies with the poor and helpless; ready with his pen, dexterous with his angle; an artist, a scholar, and a sportsman, he stands out as one of that patrician band who bridge over, as far as possible, the chasm which separates rich from poor in this country, and helps to keep England midway between the rule of either tyrants or mobs.

The title of the book may lead some persons astray. In simple truth, the author never gets out of the Lowlands at all. He has traced, from their sources to the sea, only three of the Lowland rivers. One is the Jordan, which rises in Craighouse Hill, not far from Edinburgh. The second is the Scottish Tyne, which has its origin in a small lake in Midlothian, in the parish of Borthwick. And the third is the Tweed itself. But this gives the writer an opportunity, of which he makes the most, of saying a great deal about more than twenty of the tributaries of the first of Northern streams. The style and address of the work in one particular strike us as awkward. In writing for a magazine the use of the plural pronoun is not only pardonable, but imperative, according to all literary precedent. But "we" and "our" several times in one passage, and sometimes in two or three consecutive lines, are apt to jar on the taste, especially when the personal identity of the writer stands revealed. In two instances it leads to a ludicrous assumption of royal prerogative, as when the author talks of "our son-in-law, Mr. Mitchell-Innes," and when he describes one of the rivulets that form Sulton Water as entering the grounds "of Johnston burn, belonging to our cousin, Archibald Brown, Esq., Advocate." Still the volume will have its attractions for all those who are never wearied of ancient ballads and border tales of feuds, rapine, and retaliation. It may safely be commended to the notice of idlers and tourists. It overflows with local anecdotes and poetical quotations of all sorts, from *Marmion* and the *Monastery of the Border*, and from ballads some of which might even have escaped the keen eye of Scott; and we are inclined to admit that, in illustrating scenes immortalized by the Northern minstrel, the editor has done well in not excising long passages from *Marmion* and the *Lair*. It is not always safe to presume on the knowledge and recollection of Macaulay's "educated gentleman," who was invariably supposed to "know" a marvellous number of literary masterpieces "by heart." As might be expected, lovers of Scotch traditions will find several twice-told tales in these pages. The story of the rebel of the Forty-five who escaped by rolling himself, hedgehog fashion, down a steep hill where his captors could not follow him; of an ancestor of Scott of Harden who being sentenced to death by a rival, Sir Gideon Murray of Ellibank, for his share in a raid, escaped the gallows by marrying "muckle-mouthed Meg," a daughter of the injured chieftain, who had a homely face but an amiable temper, and who turned out an excellent wife; of the Maid of Neidpath, the subject of one of Scott's most affecting ballads; the legends of the Black Douglas; the whole story of Thomas the Rhymer, his prophecies, and his residence in fairyland for seven years; the threadbare anecdote of Lord Stair and his good manners which pleased such a judge as Louis XIV.; and the account of a humbler personage, David Kyle, who kept the "George" inn at Melrose just twenty years ago, and who was the original of Captain Clutterbuck's landlord in the preface to the *Monastery*—these and several others are instances in point. But the work has many neatly executed notices of the seats of several of our best known Scotch nobility and gentry; some picturesque bits of description; a good deal of matter very suggestive to trout-fishers; and some touches which recall vividly the days when railroads had not smoothed the approach to every lake, valley, and waterfall, and had not put an exorbitant price on deer-forests and moors.

To review this work on any regular plan is simply impossible. We must content ourselves with selecting such topics as are likely to be least known. Scholars have endeavoured to prove that the celebrated passage in the *Agamemnon* where Clytemnestra describes the news of Troy's capture as communicated in one night by the beacon-fires from Mount Ida to the house of the Atridae, may be strictly and literally true. Sir T. Lauder has shown conclusively that notice of a Saxon incursion from Northumberland could have been easily given by fires kindled on the top of a series of Peel towers, ending at Oliver Castle far up the Tweed Valley, and beginning with the mouth of that river. In popular language, the alarm was given from "Berwick to the Bield." Some readers may be familiar with these old fortalices under a modern aspect. They generally had three stories, all of them vaulted. The cattle, for safety, were previously driven into the basement, which had no communication, save occasionally by a trapdoor, with the room above it. To some the access was by a ladder, to others by a spiral staircase connected with a door, easily defended, and placed in the angle of the basement. With a

* *Scottish Rivers*. By the late Sir Thomas Dick Lauder, Bart. With Illustrations by the Author, and a Preface by John Brown, M.D., LL.D. Edinburgh: Edmonston & Douglas. 1874.

little ingenuity of adaptation such ancient towers are capable of transformation into comfortable modern dwelling-houses. The larches at Dunkeld are well known to tourists for their height:—

Ubi atra vincere summum
Arboris, haud ulla jactu potuere sagitta.

But they would seem to be rivalled or surpassed by nine trees of the same species, and by an avenue of silver firs at Dalwick, the property of Sir T. Nasmyth of Posso, Peeblesshire. One of the larches, at seven feet from the ground, is fifteen feet in circumference, and no less than nineteen feet just above its roots. The others display girths of lesser proportions. Of the silver firs, one is seventeen feet just above the roots, and tapers at the summit like a fishing-rod. These trees are said to have been planted either in 1725 or in 1735. This seems an instance of longevity in larches which should challenge the inquiries of Mr. W. T. Thoms when he turns his attention from the animal to the vegetable kingdom. In the same spirit the author mentions a gigantic and venerable yew-tree at Ormiston Hall, the seat of the Cockburns, which, according to an account in Gilpin's *Forest Scenery*, published in 1834, covers "with impenetrable shade" an area fifty-eight feet in diameter. Above the roots this tree is more than twelve feet in girth. After this it is rather tantalizing to be told that a lease of a piece of ground in the neighbourhood, given by the head of a religious house at Ormiston, and believed to bear the date of 1474, was signed under this very tree. The parchment of the lease is somehow missing, and we have only the personal recollection of the communicant of the information to trust to for the year. We find no difficulty in believing the author's statement that the increment of girth of this yew is one inch in the year. The following list of good pools for angling in the neighbourhood of Coldstream reminds us of the localisms which Scott so cleverly puts into the mouths of Dandie Dinmont, Edie Ochiltree, and others of his best characters:—

Cuddy's Hole, Dyke End, Longship End, Midchannel Stream, Flummary, Kirko End, Driften-aa, Gitters, Bloody Bracks, Under Cairn, the Cauldron Hole, Three Stanes, Pikey, Three Brethren, Nether Stream, the Hole Stream, the Hole, Craw Stanes, Lang Craig, Marks-skelling-Head, Bell Stane, Leggy Bush, White Eddy, Whinbush-skelly, Shaw's Mare, Know Head.

The above, he it observed, belong to the Birgham fishings, but an angler, a philologist, or a collector of local traditions, may, if he pleases, find as attractive metal in the following, which are on the property of the descendants of the Lords Grey of Wark:—

The Snipe, the Brae, the Dub, Anna Edge, Cuddy's Hole, Skeller Rocks, Willow Bush, Island Neb, Black Marsh, Fa'en-down Brae, Hedge End, Red Heigh Stane, Hell's Hole, Mid Hole, Temple, Cauld End, Coble Neb, Coble Hole, and Bulwark.

The following is an incident of "the Forty-five," in regard to which we must say that the name and occupation of the person referred to ought to have been given. Near Harlaw Moor, watered by the Blackadder, "an individual died not long ago who recollected having seen Sir John Cope and his troops flying in a panic across it, from the battle of Prestonpans, and making eager inquiries of all they met as to which was the shortest road to Coldstream." Here is a reminiscence of the great Liberator, whom Sir T. Lauder met at a small party in London. He gave "grand and beautiful, though rapid descriptions of their scenery [Irish lakes and rivers]; enumerated all the different sorts of fish that inhabited their waters; entered scientifically into the composition of the various flies which were necessary to render the angler successful," "enlivened the whole with episcodical anecdotes of particular days of angling," and all this with as much earnestness and enthusiasm as if, on platform or hustings, he were denouncing the Saxon. With a slight change the above might, we take it, be equally applicable to a living English agitator. A curious *menu* taken from the old household books of the owners of Tynninghame House may compare with City or Conservative feasts in our own time. The family were celebrating the christening of the young heir, who afterwards became Thomas Earl of Haddington. There were the usual *pièces de résistance* of mutton and beef. Of venison there were three legs; chickens and fowls dressed in various ways, seventy-five; four salmon; twenty-two wild fowl, the same number of hares, and more than two hundred pigeons. But, curiously enough, though the festivities took place on the 21st of August, neither grouse nor black game appear to have graced the board. It is questionable whether the omission was supplied, to the satisfaction of the guests, by "twelve tongues and udders." While on this subject we might raise the question of the date when the line quoted from *Marmion* ceased to be literally correct. It makes the "snowy ptarmigan" rise before the *cortège* of the knight on the heights of Lammermoor. Now, for some generations of sportsmen this bird has not been seen or shot south of the Clyde or Forth. The following reminiscences of Bishop Burnet may supplement the full-length picture which Macaulay has given of that loquacious but intrepid divine. Burnet was presented by the Crown to the ministry of Salton in 1665, is said to have been indefatigable in his parochial duties, to have preached twice every Sunday, and to have given besides one sermon during the week. From Salton he went to the chair of Theology at Glasgow, but, remembering his old parish in his will, bequeathed to it 26,000 marks, equal to 2,000*l.*, in trust for the education and clothing of thirty children, for a new school-house, a library, an increase to the schoolmaster's salary, and for the relief of the poor. An old tree still goes there by the name of Bishop Burnet's tree. From the divine to the

writer who has painted him graphically in attendance on William III. during the passage to Torbay is but one step. Writing in 1848 Sir T. Lauder might well reproach Edinburgh, in severe but by no means undeserved tones, for its preference of Mr. Cowan at the election over the accomplished speaker and essayist. The reproduction of this incident, which is not creditable to the enlightenment of Modern Athens, though atoned for subsequently, may console some of those unfortunate Liberals who have now neither seat to occupy, plan to follow, nor leader to obey. And general readers during an autumnal tour may find much in this book which will give pleasure to the living, and not a reflection or an anecdote which casts a slur on the memory of the dead. This, in a work which deals largely with persons and places scattered over an extensive area, is no slight praise.

CLARKE ON EXTRADITION.*

WHEN the news of the escape of ex-Marshal Bazaine reached England, it was natural enough to suppose that the hero of the adventure would before long be amongst us, and the supposition led to an inquiry whether in such a case we should be expected to hand him over to the French Government if called upon to do so. The question caused a little ripple in the stagnant waters of vacation journalism, which did not subside without giving evidence of the limited character of the knowledge of some persons who are presumed to be exceptionally learned in the law, and of the need of such information as is contained in the work before us. Mr. Clarke, who has been engaged as counsel in some recent cases on extradition, has printed the treaties on the subject in a convenient shape, and has prefixed to them a couple of hundred pages in which he traces the history of this department of international law, and discusses the principles by which it ought to be governed.

Whether, apart from treaty, a State is bound by international law to surrender criminals who have escaped from another jurisdiction, has always been a vexed question. Grotius is no doubt tolerably explicit in favour of the existence of the duty, but very respectable names may be cited on the other side. Even granting the existence of the obligation, there is much doubt as to its extent and the details of its operation. M. Bluntschli, in his attempt to codify the law of nations as generally accepted, has expressed the rule upon the subject as follows:—

The duty of the extradition of fugitive criminals, or of handing over to the Courts persons accused of a crime, exists only by virtue of special treaties of extradition, or where it is demanded by the general safety. The duty in the latter alternative should attach only in the case of serious offences, and then only when the penal law of the State which demands extradition offers adequate guarantees of impartiality and civilization.

Little fault would generally be found with this statement except on the score of vagueness.

The chapter which Mr. Clarke devotes to these preliminary questions is perhaps the least satisfactory in the book, although he has looked into and given quotations from the principal authorities. He has successfully hunted down a wrong reference to Puffendorf, which had been copied by one writer after another with "persistent carelessness"; but the long note in which he traces the history of the mistake ends by asserting that the true reference is given in his text. In point of fact, however, the unfortunate reference will be found in a note, and this note happens to be rendered almost unintelligible by the misplacement of inverted commas. It is hardly fair of Mr. Clarke to put forward the opinion which Story expresses with reference to the duties of the States of the Union to one another as being equally applicable to the mutual duties of wholly independent nations, since the contrary doctrine was deliberately laid down by that great jurist in the well-known case of *The United States v. Davis*. Nor does our author support his theory of what the rule of international law on the subject really is by citing the opinions of Lord Brougham, Lord Campbell, and Sir G. C. Lewis as to what it ought to be. It is perhaps sufficient for the purposes of the statesman and the lawyer to know that, whatever views may once have been entertained upon the subject, a duty, at any rate of the kind described in the jargon of international jurists as one of "imperfect obligation," is now generally recognized for the extradition of criminals. Extradition has indeed become indispensable to counterbalance the increased facilities for escape now afforded by steam and the relaxation of the passport system. It is occasionally granted by some countries in the absence of any contract obligation, as was done, for instance, by Spain in the case of Bidwell, the wholesale forger of Bank of England notes; but, as a general rule, the extent of the duty and the conditions of its fulfilment are wholly determined by treaty.

The most practically important treaties into which England has entered are those with the United States and with France. An extradition treaty was made between Great Britain and the United States in 1794 for twelve years, at the end of which period it was allowed to expire; and, although Chancellor Kent afterwards laid down, in the case of Daniel Washburn, that, irrespectively of all treaties, it was the duty of a State to surrender fugitive criminals, and of a magistrate, upon due proof of the commission of a crime, to commit the fugitive, so as to afford time to the Government to deliver him up, the contrary view became firmly settled. To remedy

* *A Treatise upon the Law of Extradition; with the Conventions upon the Subject existing between England and Foreign Nations, and the Cases Decided thereon.* By Edward Clarke, of Lincoln's Inn, Barrister-at-Law, and late Taucted Student. Second Edition. London: Stevens & Haynes. 1874.

the inconvenience of this state of things, provisions were inserted in the Ashburton Treaty of 1842, by which the rights and duties of England and America continue to be regulated to the present day. Either of the contracting parties is to deliver up to the other all persons charged with murder, assault with intent to commit murder, or piracy, or arson, or robbery, or forgery, or the utterance of forged paper. The operation of this and all other extradition treaties of the United States is regulated by an Act of 1848, entitled "An Act for giving effect to certain treaty stipulations between this and foreign Governments for the apprehension and delivering up of certain offenders." The provisions of the Ashburton Treaty have fairly answered their purpose, but as much can hardly be said of our extradition treaty with France, which dates from 1843, and comprises murder (comprehending the crimes designated in the French penal code as assassination, parricide, infanticide, and poisoning), attempts to commit murder, forgery, and fraudulent bankruptcy. The Act by which the convention was confirmed provides that committal by a magistrate is to take place upon such evidence as would justify the committal of the person accused if the crime of which he was accused had been committed within British dominions. And this provision has thrown considerable difficulties in the way of the French Government, for Mr. Clarke tells us that between 1843 and 1852 France claimed fourteen fugitives, but only in one case succeeded in obtaining extradition. A convention was consequently concluded in the latter year by which the commitment with a view to extradition of French criminals would have been very much facilitated. On production of an *arrêt de condamnation* or of a *mandat d'arrêt* the Secretary of State might issue his warrant to a magistrate, who thereupon was to arrest the accused, and, on being satisfied of his identity, to make an order for his extradition. The convention also largely added to the list of offences to which the treaty of 1843 is applicable, but it failed to obtain Parliamentary confirmation. The House of Lords refused to abolish the rule which requires *prima facie* evidence of guilt to be produced before the magistrate. The Treaty of 1843 continued to be found as unworkable as before, and the French Government, having only succeeded once in twenty-two years in obtaining extradition, gave notice in 1865 to terminate the convention, but subsequently waived the notice, and has since obtained several surrenders.

The labours of a Committee of the House of Commons appointed in 1868 led to the passing in 1870 of a comprehensive statute consolidating and amending the previous enactments upon the subject. The most important change made by the Act is that it abolishes the necessity for confirmation by Act of Parliament of future treaties of extradition, a necessity which had prevented the conclusion of several treaties. The formalities previous to arrest, which often gave the criminal timely warning to escape to another jurisdiction, are done away with; but, in compensation, a delay of fifteen days is granted between committal and surrender to the foreign Power, in order to allow of the validity of the proceedings being tested under a writ of *habeas corpus*. Express provision is made for the non-surrender of political prisoners, or of a prisoner who can show "that the requisition for his surrender has in fact been made with a view to try or punish him for an offence of a political character." Under the Act of 1870 treaties have been made with Austria, Brazil, Belgium, Denmark, the German Empire, Italy, and Sweden, and it would be a wholly satisfactory piece of legislation had it not been disfigured by the so-called "Amending Act" of 1873, which is justly liable to the strictures passed upon it by Mr. Clarke.

The cases discussed by the Courts under treaties of extradition, even where they have ostensibly turned on points of procedure, have often involved questions of a peculiarly interesting and delicate nature. Perhaps the most interesting case of all was that of the slave Anderson, who, having killed one Diggs who endeavoured to prevent his escape, took refuge in Canada, but was claimed by the United States Government as a murderer. Anderson was committed by a magistrate, but a *habeas corpus* was sued out, and it was argued before the Canadian Court of Queen's Bench that the committal was illegal. The magistrate was bound, under the Canadian statute, to have satisfied himself of there being evidence "sufficient to sustain the charge according to the laws of the province," and according to the laws of the province the killing of Diggs would be no murder. The Court, however, held that the words "according to the laws of the province" referred only to the amount of proof, and not to the definition of the offence. Anderson might therefore have been hanged, had not a *habeas corpus* been applied for in the English Court of Queen's Bench, where a curious question was raised which had to be set at rest by Act of Parliament, and at the same time in the Canadian Court of Common Pleas, which on very technical grounds managed to release the prisoner.

Although a general similarity runs through treaties of extradition, there are several points upon which there is an apparently irreconcilable difference of opinion and practice between different nations. Thus it is settled law in France that the Courts may try a surrendered criminal for an offence other than that for which he is surrendered, although the Executive may perhaps interfere to prevent the sentence for such an offence from being carried out. The English Act of 1870, on the other hand, restricts extradition to cases where the foreign Government arranges that the fugitive shall not be tried for any offence committed prior to his surrender other than the extradition crime, until he has been restored, or has had an opportunity of returning, to Her Majesty's dominions. The surrender of their own subjects is, again, accorded by the

Governments of the United States and of England, but refused by those of the Continent. Whether a fugitive should be surrendered to any country but his own is another point upon which different views are entertained. It was raised, but not decided, in the case of the Belgian, Marguerite Dixelanc, who was surrendered at Paris to the English police on account of a murder committed in London. The exemption of political offenders from liability to be surrendered is now generally established, and it seems hardly credible that one Napper Tandy was, so lately as 1792, given up by the Senate of Hamburg to the English Government on a charge of treason, or that the treaty of 1828 between France and Switzerland comprises "*les crimes contre la sûreté de l'Etat*."

It has been suggested that, instead of delivering over criminals to the State where their crime was committed, the State where they have sought an asylum should itself bring them to justice. Mr. Clarke points out that the proposed substitute for extradition would be wholly inadequate. The State which now reclaims the criminal would have no security that he would be punished. The proofs of crime at a distance from the scene of its commission would be difficult and expensive; an innocent person might find it impossible to establish his defence; and the domestic tribunal would have to administer foreign law. Mr. Clarke's accurate and sensible book is the best authority to which the English reader can turn upon the subject of extradition.

AINSWORTH'S MERRY ENGLAND.*

A STORY is told of a clergyman who in his old age always chose the same text and preached the same sermon. When his congregation, impatient at last at the sameness—for even church congregations can grow impatient—let him know that they wished, like the men of Athens, to hear some new thing, on each following Sunday he gave out a new text indeed, but followed it up with the old sermon. Now Mr. Harrison Ainsworth seems to us to do much the same thing. The texts that he takes are, if we may say so, the risings and rebellions in English history, but the tale that he tells is always the same. It may be supposed that there must of necessity be some difference between the story before us, which tells of Wat Tyler's insurrection, and his previous novel, the scene of which was laid in the rising of '45. It would be hard nevertheless to say where any difference lies except in the names. One of Mr. Ainsworth's scenes which is laid in Lancashire in the eighteenth century differs from another of Mr. Ainsworth's scenes which is laid in Kent in the fourteenth century about as much as a Bath-bun on the refreshment counter at Preston differs from a Bath-bun on the refreshment counter at Dover. In fact, in whatever age or in whatever part of the country he lays the scene, he still keeps us in what Johnson calls the slaughter-house—giving us, to use his further expression, more blood than brains. We learnt indeed in the Tichborne trial that the butcher's trade admits of a great deal of variety, so that, by the way a man cuts up a carcass, it can be at once seen in what school of butchery he was trained. While the Australian butcher hacked his joints, Arthur Orton showed all the graceful dexterity that can be acquired at Smithfield alone. In what school of writers Mr. Ainsworth learnt his trade we have no means of knowing. He is ever hacking to pieces heroes and heroines, good men and miscreants, but his jointing is all done in one style, and that a very vulgar one. He has indeed a kind of antiquated mode of writing which in all his so-called historical novels he puts on whenever he happens to remember it. But a few phrases in this fashion scattered through the work about as much suggest to our mind a mediæval scene as a few trumpery bits of Brummagem brass scattered about a drawing-room remind us of Damascus or Cairo, from which they are said to have been brought. "Your proposition likes us well" sounds well enough in King Richard's mouth. "Sdeath," too, does not come amiss, for in his oath surely our author need not fear the reproach of anachronism. But then when Mr. Ainsworth, by such words as these, has set us, if not in any one age, at all events out of our own, he cruelly breaks the illusion by bringing in "exalted personages," "villainous characters," and "stalwart individuals." The heroine gets "positively enraptured," while Wat "checked the ebullition" that followed on "his inflammatory speeches." At times, indeed, Mr. Ainsworth seems so well to assume an air of antiquity that he forgets to drop it where it might be properly laid aside. A tavern on Hampstead Heath, for instance, is not in the present day generally described as a "much frequented hostel," even though it "has acquired the designation of Jack Straw's Castle." We would suggest for the consideration of the Civil Service Commissioners whether they might not find here a useful hint for their examinations. How admirably might a student's familiarity with English literature be tested by some such question as the following:—"If in writing a tale you call a public-house an hostel, how would you describe a pot of porter?" Indeed it would not be amiss if all our historical novelists could be put through a course of paraphrasing, and were not allowed to write till they had shown that they knew at least a score or two of phrases suited to each century. But this speculation, though interesting, leads us too far from Mr. Ainsworth's story.

The heroine of *Merry England* should be, we suppose, Wat Tyler's daughter, or rather his supposed daughter, as she presently

* *Merry England; or, Nobles and Serfs*. By William Harrison Ainsworth, Author of "The Tower of London," "Roscobel," &c. 3 vols. London: Tinsley Brothers. 1874.

turns out to be. With her King Richard falls madly in love a day or two after his taxgatherer had got knocked on the head for insulting her. As history here was too strong even for Mr. Ainsworth, there was nothing left for her, as she could not become Richard's wife, but an early grave. Mr. Ainsworth, however, knows too well that somebody must be married in the last chapter of a novel, or else the reader will not think that he has had full value for his money. So he keeps in readiness a brewer's son, Conrad Basset by name, and Sir Lionel de Courcy's beautiful daughter Catherine. Conrad some short while before the story opens "had attracted the fair Catherine de Courcy's attention." He had been surprised in his first secret interview with her by her father, who "after applying to him every scornful epithet that fury could suggest," then cried out, "I will punish thee as I would a disobedient son." Thereupon "he took a staff from one of his valets, and struck the young man several hard blows with it, calling out—'This will teach thee, thou low-born knave, to aspire to the daughter of a noble.'" Just at this time Wat Tyler and his host came to attack Canterbury, where lived the knight and the brewer. Conrad joins the insurgents, and is on the morrow to head an attack on Sir Lionel's house. That night Catherine seeks an interview with her lover, and entreats him to spare her father:—

"As well might you seek to wrest his prey from the tiger, as ask me to part with mine," cried Conrad.

"Then farewell for ever," she said. "You will rue your conduct when you see me stretched lifeless at your feet."

A brief pause ensued, during which it was evident that a great struggle was going on in Conrad's breast.

In the hope of a change in his determination Catherine stayed.

"You have conquered," he said at length.

He allowed the knight and his daughter to escape in the night. Next morning "the insurgents were greatly disappointed, for they meant to behold the knight." The reader also might have been equally disappointed, only happily there were still a few heads left to come off. Here then we already have in this pair of lovers interest enough for one historical novel, even if there were not also in it a King of England burning to marry a blacksmith's daughter. It surely requires, one would think, all Mr. Ainsworth's skill to marry together a "low-born knave," the captain of one of Wat Tyler's companies, and the daughter of the noble house of De Courcy. He is not satisfied, however, with the difficulties he has raised before him, but introduces a rival to the fair Catherine in "a young woman of gigantic size, and strongly proportioned." She demands permission to accompany the insurgents. "Though the two rebel leaders had resolved to allow no woman to accompany the host, they were so much struck by this Amazon's appearance that they felt inclined to make an exception in her favour." She at once gives proof of her prowess by stretching a sturdy fellow on the ground with her quarter-staff, and is straightway enrolled. It was well for Conrad that she had joined, for when in the siege of Eltham Palace he "was made a mark by the archers on the barbacan, he escaped without injury owing to the vigilance of a gigantic woman who stood by his side. With a large triangular shield she ward off many a shaft and bolt aimed at Conrad." Moreover, it was by following her advice that the palace was at last stormed. The leaders were disheartened, when she, "in a tone that scarcely admitted of dispute," directed them how to take the barbacan. They wanted a battering-ram, she said, and she had noticed a huge beam:—

"'Twill take a dozen men to lift it, but I will help them, if need be."

"Ha! I see!" cried Conrad, joyfully; "with this beam thou wouldst burst open the postern?"

"That is my plan," said Frideswide. "When the postern is burst open, as it will be of a surety by this simple battering-ram, who is to prevent thee from entering the barbacan? Not Sir John Philpot!"

"No, by St. Anselm, not twenty Philpots!" cried Conrad. "Thou hast devised an excellent plan. The barbacan once gained, the palace will be ours."

"Ay, marry will it," said the Outlaw.

The beam was brought up by some twenty stout yeomen. "One blow of this tremendous engine was sufficient." How, by the way, a beam becomes an engine, we are not told. Though the barbacan was taken, yet the main part of the palace held out, though "battering-rams, each worked by a score of stalwart individuals, were employed." Treachery at last opened those gates which the strength of stalwart individuals, aided though they were by nefarious characters, could not break through. It was no wonder that by this period of the story "Wat Tyler had assumed a haughty, even arrogant, mien very different from his former deportment." To mine host of the hostel at Dartford he exclaims:—"I have now seventy thousand brave followers on Dartford Brent—seventy thousand! What dost thou think of that? Ha!" A vision, however, came to trouble him which had appeared to a holy hermit. "A chill, as of the grave, fell upon Wat, and seemed to benumb his faculties." Frideswide happily was close at hand, and exclaims:—"Thou hast an army with which thou canst exterminate all the nobles of the land, and raise thee up a sovereignty, an' thou choosest. Wilt thou abandon it at the word of a drivelling friar?" Wat hereupon calls his old friend the hermit "a false priest." As Frideswide had just before called him "a visionary friar," there is nothing left for the good man to do but to tell Wat that he is a proud man and must meet his doom, and then to retire. Frideswide next got her rival Catherine into a subterranean passage, and, "shutting the trapdoor, stifled the cries of her victim." She is found by Conrad, who had been assailed by the worst apprehensions, standing with her foot on the trapdoor and looking perfectly calm. He calls her a remorseless

woman and a murderess. She replies that she can justify herself before Wat Tyler, and so drags him from the chamber. The next day King Richard in his barge had an interview with Wat, Conrad, and Frideswide as they stood on the banks of the Thames. Sir Simon Burley, who was in the boat with the King, suddenly cried out to his men, "Ho, there, archers! make you rebel your mark!" At this moment Frideswide, "divining their purpose, and dashing forward with lightning swiftness, came up just in time to spread her broad shield before Wat Tyler. The rebel chief was unhurt, but a fatal shaft pierced the Amazon's breast." She had just time to tell Conrad that Catherine still lives "in the subterranean passage beneath the tower," when she dies. Conrad rescues the "distracted damsel," and then persuades his followers to go over to the King's side. "Just at the very nick of time he appeared" on Tower Hill. Jack Straw had taken Richard prisoner when Conrad, twice calling his late comrade a villain and a traitor, and announcing himself as "the avenger," engages in "a brief but terrible combat" with him. Though the King and hundreds of other spectators regarded it with fearful interest, they did not happily attempt to meddle in it, and so to spoil its melodramatic effect. "It resulted in the death of the Outlaw, whose throat being pierced by Conrad's sword fell backwards from his steed, exclaiming with his latest breath, 'Curses on thee, traitor! Thou hast robbed me of the Crown.'" What became of the rest of the body of the Outlaw when his throat fell backwards we are nowhere told. No one probably had time to attend to it, for "Richard drew his sword, and in the presence of all his nobles dubbed his deliverer knight." A few weeks later "the marriage of Conrad Basset and the lovely Catherine de Courcy took place at Canterbury Cathedral." No doubt the Archbishop would have performed the service himself, had it not unfortunately happened that "a stalwart individual," who is also described as "the ruffianly headsman" and "the surly cut-throat," had at an earlier period, "at the seventh stroke, severed the good man's head from the body."

FRENCH LITERATURE.

THE reputation which M. Louis Fignier's *Année scientifique* obtained almost as soon as the first volume was published had the effect of calling forth a legion of works written on the same plan, more or less illustrated, more or less accurate, and sometimes, unfortunately, stamped with a political animosity which should not have been allowed to find its way into books professing to treat of natural history, astronomy, and chemistry. Every newspaper of any importance on the other side of the Channel has a weekly *feuilleton* devoted to science; these *feuilletons*, tacked together and arranged under distinct headings, easily make up a duodecimo at the end of the year; and thus the non-scientific part of the community is enabled to form some notion of the principal inventions and discoveries which have taken place within the previous twelve months. M. de Parville's *Causeries**, now before us, are a very fair specimen of a branch of literature which is evidently on the increase; they have already run through a successful career of thirteen years, and deserve, on the whole, the encouragement given to the author. The book is well written, and neatly illustrated with fifty woodcuts.

M. Jules Girard aspires †, like M. de Parville, to the honour of being a popular lecturer on science, and he takes the microscope as his special province. His intention is to examine in succession the three kingdoms of nature as they are represented in the water, and the first part of his volume treats of the animal creation. He gives a number of curious details as to the development of *infusoria*, and his description of the sponge leads him by a natural transition to the phenomena of vegetable life. The third section of the work is taken up by microscopic mineralogy, including some particulars as to the formation and metamorphoses of crystals.

Geology and the practical determination of rocks form the subject of another handbook for which M. Edouard Jannetaz is responsible. ‡ His work is one of the most complete we have seen on the subject, considering its elementary character. It is copiously illustrated like the two works previously noticed.

M. Guillemin's treatise on Light and Colours § is the third instalment of a popular collection of scientific books. The great difficulty in the preparation of such works is to be complete whilst strictly avoiding mathematical formulæ; but M. Guillemin has managed to solve this delicate problem with considerable success, and his useful volumes commend themselves equally to persons who have had no previous scientific education and to those who wish to review briefly their old and sometimes half-forgotten studies.

The volume just published by M. Ernest Vinet || is not limited, as the title might lead us to suppose, to topics connected with art and archaeology; literature supplies its quota to the essays here collected, and three biographical sketches of Thorvaldsen, Halsvyy, and the Duke de Luynes throw a little variety into a book which otherwise might have appeared somewhat too technical in its

|| *L'Art et l'Archéologie*. Par M. Ernest Vinet. Paris: Didot.

character. M. Vinot has made a special study of the fine arts, and his official position enables him to speak with authority on the subject. His disquisitions are remarkable not only for impartiality and sound criticism, but also for elegance and brilliancy of style; the description of the late M. Flandrin's frescoes at the Church of St. Germain des Près in Paris will amply repay the time which the reader may bestow upon it.

As we are speaking of artistic matters, we may mention the splendid portfolio of drawings which M. Frœhner has presented to the public*; it comprises forty photographs and engravings, accompanied by an elaborate commentary, and reproducing bronzes, terra-cottas, jewels, sepulchral monuments, and other interesting specimens of classical antiquity. It would be difficult perhaps to select for particular notice any one of these artistic remains, as each of them has some distinctive merit of its own which recommends it to the attention of antiquaries; but we can hardly be wrong in supposing that the magnificent bronze busts of Augustus and Livia examined in the first notice will obtain the preference. They were purchased at M. Frœhner's suggestion in 1868 for the Museum of the Louvre, at a cost of thirty thousand francs, and had nearly found their way to our own collection; but, as we are told, the authorities of the British Museum, hearing that the Emperor Napoleon was anxious to buy them, declined to outbid him, prompted by a spirit of courtesy which M. Frœhner acknowledges. The busts in question are admirable works of art; but they have also an interest for the epigraphist, the historian, and the student of Roman mythology which our author explains and justifies. Thus it is well known that when Livia had recovered from a serious illness, Tiberius caused a magnificent bronze commemorative medal to be struck, representing on one side a female head, with the inscription "Salus Augusta." Some scholars regarded this figure as a portrait of Livia, but the matter was considered doubtful, and many antiquaries looked upon it merely as a fancy embodiment of the Goddess of Health. The bust of which we are now speaking, and which is undoubtedly meant for Livia, tallies exactly with the head on the medal struck by the order of Tiberius, and thus a curious problem is settled at once. M. Frœhner does not tell us whether the splendid folio for which we are indebted to him is a promise of further good things to come; we sincerely hope that it is, and we believe that a publication of this kind extended to ten or twelve parts, so as to give choice specimens of ancient art in all its branches, would meet with due encouragement from the public.

M. Jules Janin was an admirable *feuilletoniste*: his brilliant style never appeared to better advantage than in the columns of a newspaper, and the reader remained spellbound when the article was finished and the tale told. But the very qualities which gave to the critic of the *Journal des Débats* a place apart from his conditors would be serious faults in a work of any considerable extent. A plate of trifle may be good, but a course of trifle would be loathsome; a display of fireworks is pleasant when it does not last beyond a few minutes, but, continued for a whole hour, it dazzles and annoys. This is exactly the case with M. Jules Janin. No reading can be pleasanter than his newspaper articles; his volumes, on the other hand, are intolerable, and we do not except from this condemnation the book on Paris and Versailles, which may almost be considered as his posthumous legacy to literature. Under this title he has collected a number of anecdotes arranged without any method, and bringing into close connexion characters of the most opposite kinds. Mlle. Duthe's boudoir offers an odd contrast to the University of Paris, and St. Sulpice is not precisely an appropriate companion picture for the Café Procope. M. Jules Janin had another fault which is far more serious than mannerism in expression and superabundance of metaphors; his erudition was often of the queerest description, and, as he was fond of quoting Latin, he not unfrequently blundered in the most amusing manner. To conclude, *Paris et Versailles il y a cent ans* will give a very fair idea of the author, and it will be safer to judge of him from his last book than from the once famous *Àne mort* which was the foundation-stone of his literary reputation.

The Life of M. Olier † by M. Faillon is an excellent work, and we are glad to see a fourth edition of it. When, after the religious wars of the sixteenth century, attempts were made within the bosom of the Gallican Church to bring about reforms long deemed necessary by the Catholics themselves, M. Olier was one of the first to take a part in the movement; he did his best to improve the French clergy; and he founded the ecclesiastical school of St. Sulpice, from the midst of which so many distinguished theologians have come forth at various times. M. Olier was the contemporary of St. Cyran and St. Vincent de Paul; like these eminent men, he saw clearly the spiritual requirements of French society, and endeavoured to supply them. As he corresponded with Cardinal de Richelieu, Anno of Austria, Charles II., and a number of distinguished personages, his history is intimately connected with that of the seventeenth century, which it illustrates at almost every step.

The biography of General Lee § which is now before us is a valuable contribution to the history of the Civil War in the

United States. The author, who is a nephew of the great Confederate General, begins by remarking that the real cause of the rupture was the difference existing between the constitutions of the antagonistic States; a split had, he says, become unavoidable, long before the slavery question assumed its eventual prominence. If we may believe M. Lee Childe, the Confederates looked upon the emancipation of the negroes as a phase of progress which would be the work of time, and, if they took up arms in order to maintain slavery, it was only, he contends, because they did not choose to submit to what they regarded as unconstitutional dictation on the part of the Federal Government. The author first gives the biography of General Lee, and defends the prominent position he assumed during the war; we have next an account of the military operations which ended in the capitulation of April 9, 1865. The volume is well written, and the illustrations (portrait and maps) added by the publisher deserve also a word of praise.

M. Menier* does not bow before the proverb *ne sutor ultra crepidam*. He leaves his chocolate in order to discuss points connected with finance, and writes a formidable octavo on the subject of taxation. From his preface we gather that M. Menier is regarded in France as a dangerous character; he has been refused permission to publish a newspaper, and the Government would, if it could, prevent the sale of his new volume. M. Menier considers that the present system of taxation is both absurd in itself and destructive of the national prosperity; he goes on to examine the various theories propounded by economists and legislators, and he finishes by suggesting that capital should be progressively taxed, to the exclusion of everything else. According to this very fearless reformer, the scheme of confiscation which he advocates would have the twofold advantage of simplifying the financial administration of the country, and of being far more productive than the taxes now raised. Whatever may be thought of M. Menier's theories, the historical part of his volume is curious.

Recent events give unusual interest to M. Billot's learned and exhaustive treatise on extradition.† He opens with a few general considerations as to the right of a State to claim the surrender of criminals who have taken refuge abroad, and then goes into a variety of historical details showing the relations maintained by France with foreign Powers from the beginning of the last century down to the present time, so far as extradition is concerned. What are the persons who fall under the application of the law? What are the crimes against which it can be enforced? How is the procedure conducted, and what are its effects? These topics engage in succession M. Billot's attention, and the work concludes with a copious selection of diplomatic documents which illustrate his arguments.

M. Véron has just published the second volume of his History of Germany.‡ The first ended with the campaign of Sadowa; the present one describes the late war, and concludes with a review of the difficulties by which Prussia is surrounded. M. Véron is of opinion that the military system which now presses upon Germany cannot last for any length of time, and that if France would only accept democratic institutions frankly and resolutely, Prince Bismarck's system of foreign policy must collapse at once. Prussia's aim, he tells us, is to destroy France, and, in order to do so, the clever statesman who rules in the name of the Emperor Frederick William is endeavouring to create fresh difficulties for Marshal MacMahon's Government. The civil war now raging in Spain is an event which may lead to an intervention, rendered more necessary by the attitude of Denmark and the rapprochement between Russia and Austria. Prince Bismarck, according to our author, evidently begins to find that his position is fraught with serious dangers, and that the working of a federation of monarchs is not so very easy after all. On the first signal the discordant elements of which the German Empire is made up will fall asunder—such is the prediction of this very sanguine and patriotic writer—and France will regain her former place in the affairs of Europe.

Colonel Denfert-Rochereau's pamphlet §, although barely extending to twenty pages, treats of a very important subject—namely, the political rights of military men, and especially their eligibility as members of the National Assembly. A M. Philippoteaux, who represents the department of Ardennes, having lately brought in a Bill for the purpose of depriving officers on active service of the privilege of standing as candidates for the Assembly, Colonel Denfert argues in the first place that political education is quite as necessary to military men as a special professional training. He then shows by many instances that, whenever the army has been led to interfere in domestic political struggles, it has been under the command of generals systematically ignorant of Parliamentary life. Finally, he remarks how the two epochs in the nineteenth century which have been conspicuously characterized by "militarism" have ended in the most terrible disasters experienced by France for four hundred years. Hence the necessity of extending to military men the right of sharing in the political life of the nation.

M. de Pontmartin has often claimed our attention before, and he now comes forward with a fresh series of literary portraits, most of which have been contributed to the *Correspondant*.|| The seventeenth century is here represented by Mlle. de

Scudéry, and, as it has become the fashion to appeal against the sentences of condemnation passed upon offenders of every kind, our entertaining critic takes up his pen in defence of the illustre Sappho, as she was called in the vocabulary of the *Précieuses*. Either our taste is extremely vitiated, or Boileau was unnecessarily severe when he fulminated the severe decrees which make up his *Art poétique*. M. de Pontmartin is not the first of contemporary journalists who have made themselves the champions of Mlle. de Scudéry; M. Cousin devoted two large volumes to that lady, and M. Sainte-Beuve gave her a distinguished place in his earliest *causeries*. Under such powerful patronage she has every chance of regaining her lost rank in public opinion; and we really believe that she deserves to be better known than she is at present. With the exception of Sappho, all the characters described by M. de Pontmartin are persons of our own day. M. Renan, M. Mérimée, M. Pierre Lebrun, M. Sainte-Beuve himself, and many others are either still to be found on great occasions in the large reception-room of the Palais Mazarin or have only recently been struck off from the lists of literature and science by the hand of death. Politics occupy a considerable place in this volume, and the author never loses an opportunity of denouncing the *citoyens* who, grouped around M. Gambetta, form the Extreme Left of the Legislative Assembly.

The new volume of M. Théophile Gautier's works just published* is intended as a sequel to the *Histoire du romantisme* noticed by us some time ago. It comprises a series of portraits originally written for sundry periodicals, all of which are intimately connected with the origin and growth of the Romantic movement. Most of these articles, taken from the *Figaro* newspaper, scarcely reach the proportions even of an ordinary *feuilleton*, and we cannot say that they deserved to be rescued from the obscurity into which they had disappeared. Thus, instead of a critical estimate of Mlle. Georgea, Mme. Damoreau, and Mlle. Falcon, each of these celebrated actresses suggests nothing to M. Gautier but a few lines of insignificant compliment which would leave the uninitiated entirely in the dark as to the nature of her talent. We wish to know how the first-named of these ladies played the part of Lucrèce Borgin in M. Victor Hugo's tragedy, and we are merely told that she had the profile of *une Iris des bas-reliefs égyptiques*. What do we care whether the delightful artist who created the part of Angèle in *Le Domino noir* had or had not pretty hands? We should like to hear some criticism on her style of singing, and that is precisely what M. Théophile Gautier does not give us. The articles he has devoted to literary characters are much better, and we notice in particular a very interesting sketch of Mme. Sophie Gay, the mother of Mme. Émile de Girardin.

The last two volumes of Mme. de Blocqueville's delightful work confirm in every respect the impression which the previous ones had produced upon us.† It is gratifying to find thoughts of so elevating a kind in a work sent forth by the Paris press, and if the style is here and there spoiled by a little affectation and obscurity, we overlook this fault for the sake of the ideas to which the author gives expression. It would be impossible to give any sort of analysis of the *Soirées de la ville des Jasmis*; aesthetics, philosophy, natural science, psychology, and history contribute in succession to the pages of the volumes before us, and afford plenty of suggestive materials for the conversation of the select party assembled under the roof of the Duchess Eltha-Lucifera. A critic has remarked somewhere that Mme. de Blocqueville makes her heroine speak like a Christian George Sand, and that Eltha has many of the qualities which would have "spiritualized" Lelia. The observation seems to us just, and readers who remember the early novel of Mme. Dudevant will be prepared to enjoy the brilliant style of the *Soirées*. Few books of equal merit can be found amongst the recent productions of French intellectual activity.

Under the formidable title of *Le legs de Cain* ‡, M. Sacher-Masoch has just published a series of tales to which no one will deny, at all events, the merit of originality. We are at once transported into the midst of a society respecting which we know absolutely nothing, and the *dramatis personæ* move about with a freedom very different from the conventionalisms of Paris or London society. Of course the passions delineated in a book professing to be the legacy of Cain must be of the gloomiest description; but their wildness is at least preferable to the artificial depravity of the heroes whom M. Paul Féval delights in portraying.

The adventures encountered by Baron de Wogan § during his travels are often so extraordinary that we have no hesitation in classing his new volume amongst works of fiction. One merit at any rate he possesses, and for the majority of readers it will overbalance many faults of style; he never wearies us. We certainly should give a preference to the *Pirate malais* over the new book of M. Jacquot ||, which is, notwithstanding the author's extravagant pretensions, nothing but a poor imitation of Théophile Gautier, Méry, and Gérard de Norval.

The September number of the *Bibliothèque universelle* ¶ is an ex-

cellent specimen of a periodical which deserves to be more extensively circulated in England than it is at present. M. Charles Secrétan, the distinguished author of *La philosophie de la Liberté*, contributes an interesting sketch of the state of religious liberty in Europe. M. Rivier publishes a series of documents hitherto unknown which throw considerable light on Count Cobenzl and on German society towards the end of the last century. Two tales represent the share of imagination and fancy in this unpretending publication.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

THE SATURDAY REVIEW

OF
POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 983, OCTOBER 3, 1874:

Italy. Canada and Lord Dufferin.
Mr. Gladstone on Ritualism. The Imperialists and their Humble Friends.
Mr. Leatham at Huddersfield. Farm-Labourers and their Friends.
The Social Science Congress. Mr. Disraeli and Ireland.

ADVERTISEMENTS.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRETORIUM," with "The Dream of Pilate's Wife," "Night of the Crucifixion," "Christian Martyr," "Francisco de Rimini," "Andromeda," &c., at the DUKE GALLERY, 35 New Bond Street, Ten to Six.—Admission, 1s.

FOURTEENTH CHURCH CONGRESS, BRIGHTON, 1874, OCTOBER 6, 7, 8, and 9.

PROGRAMMES AND TICKETS ARE NOW READY.

Members' Tickets (not transferable) 5s. each, admitting Ladies and Gentlemen to all the Meetings of the week, except the Free Meeting for the Working-Men on Thursday Evening, for which a limited number of Special Tickets (for Members of Congress only) may be had at 2s. 6d. each. Applications by letter must be accompanied by a remittance, and name and address of every one for whom a Ticket is required. The Committee do not recommend payment to be made by stamps, but if so made, two extra stamps must be sent for each Ticket. P.O. Orders should be made payable to

FREDERICK M. WEISFORD, Acting Secretary.

Temporary Office: Central Schools, 108 Church Street, Brighton.
Personal attendance from Ten till Two.

ROYAL POLYTECHNIC.—EXPERIMENTAL CLASS OF LECTURES by Professor GARDNER, F.R.S., M.S.A. Morning Class—Chemistry of Metals and Manufactures. Fee, Four Guineas. Evening Class—Heat and Non-Metallic Elements. Fee, Three Guineas. Classes on Electricity, Photography, &c., are forming. Laboratory open for Practical Work.—Application to Professor GARDNER, at the Institution.

MR. HANDEL GEAR, Professor of Singing, in Italian, French, German, and English, begs to acquaint his Pupils that he has RETURNED TO TOWN.—66 Seymour Street, Portman Square, W.

DURHAM GRAMMAR SCHOOL.—KING'S SCHOLARSHIPS.—The EXAMINATION OF CANDIDATES for the KING'S SCHOLARSHIPS will take place in the Chapter Room, on Wednesday the 18th, Thursday the 19th, and Friday the 20th November, 1874, at 9 A.M., when THREE SCHOLARSHIPS will be appointed to supply the present Vacancies.

These Scholarships (18 in number) are of the annual value of nearly £40 (£20 in money, with exemption from classical fees), and are tenable at the School for four years, to which a fifth may be added by the Dean.

Any one under fifteen years of age, whether previously at the School or not, is admissible as a Candidate, provided always that his parents are not in wealthy circumstances. Candidates must send in their names, with certificates of their birth, and statement of circumstances, to Mr. E. FELLE, The College, Durham, on or before Thursday, November 13.

Further information may be obtained by applying to the

Rev. HENRY HOLDEN, D.D., Head-Master.

ELIZABETH COLLEGE, GUERNSEY. Visitor—The BISHOP of WINCHESTER.

Valuable University Scholarships and College Exhibitions for annual competition. Special attention paid to Modern Languages and the Preparation of Candidates for Woolwich, Cooper's Hill, Control Department, Army and Navy, and Civil Service. NEXT TERM commences October 14.

THE COLLEGE of STE. BARBE, Paris, Place du Panthéon, will RE-OPEN on October 6. This College is one of the oldest in France, and offers special advantages to Young Foreigners, as, besides providing a Classical Education, it has Special Classes preparatory for Commercial and Industrial Pursuits—Science, Modern Languages, Mathematics, Book-keeping, &c. It has, further, a Branch Establishment for Children in the Country. Reference is permitted to M. Antonin Roche, Director of the Educational Institute, 55, rue de Valenciennes, Paris, or to M. J. B. de la Roche, 10, rue de Valenciennes, Paris, according to the age of the Pupils.

* *Portraits contemporains*. Par Théophile Gautier. Paris: Charpentier.

MISS MARY LEECH'S MORNING SCHOOL FOR YOUNG LADIES is now OPEN, at 14 Radnor Place, Hyde Park, W.

THE MESSRS. A. and R. LEECH'S SCHOOL (late Belgrave Cottage) for **LITTLE BOYS** is now OPEN, at 65 and 66 Kensington Gardens Square, Hyde Park, W.

MORNING PREPARATORY CLASS for the **SONS** of **GENTLEMEN** (exclusively), 13 Somerset Street, Portman Square. The **AUTUMN TERM** will begin on Thursday, October 3.

FOLKESTONE.—**Mr. W. J. JEAFFRESON, M.A., Oxon.** (formerly Principal of the Finsbury High School, Bunbury), with the Assistance of a Cambridge Honours-Man, prepares **PUPILS** for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations. Terms and References on application.

ARMY, WOOLWICH, COOPER'S HILL.—**MORGAN JENKINS, M.A.** (Warrington), assisted by an able Staff of Graduates in First-class Honours (including a Second in First Class of Nat. Sci. Tripos), prepares **RESIDENTS** and **NON-RESIDENT PUPILS** for the above. Four out of Six sent up for Cooper's Hill, the only Pupil for Woolwich, and Three out of Four for the last Ling Examination have passed. Address, 30 Cornwall Road, Westmount Park.

EDUCATION for **BOYS**, free alike from Clerical and Dissenting influences, in the Family of a Layman, a **CAMBRIDGE M.A.** of much Experience, Ages Ten to Twenty, Terms high. Address, THROCKMORTON, Messrs. Kirby & Landon, Publishers and Booksellers, 100, St. Paul's Churchyard.

STANFIELD HOUSE, Green Hill, Hampstead.—**Mr. T. M. JACOBS, A.K.C.**, assisted by Eminent Masters, receives into his house a very select number of **PUPILS** to Educate or to Prepare for the Public Schools, into nearly all of which Boys have been passed by him to high forms. The House and Grounds are spacious and healthily situated near the Heath. High references may be obtained from the Nobility and Clergy whose Sons Mr. Jacobs has educated. Further particulars on application.

PRIVATE TUITION for **ARMY, COOPER'S HILL, CIVIL SERVICE, WOOLWICH, AND UNIVERSITIES.**—**Rev. Dr. HUGHES WILSON** (Cam.) who has passed over 300, has **VACANCIES**. Also quite a few young Boys. Address, W.

BOARDING SCHOOL for **YOUNG GENTLEMEN**, **MONTEBELL, Switzerland.**—**Mr. and Madame RENNEWITZ** beg to announce the removal of their Establishment into a spacious and comfortable House, beautifully situated on an eminence, with extensive grounds. They receive a limited number of **YOUNG GENTLEMEN** especially for the study of the French and German Languages, together with a sound English Education. Terms moderate. Masters resident in the Establishment. References on application to the Principals.

A YOUNG LADY, about Nineteen, well educated, and with special reference to qualifications as a Teacher, who speaks French with fluency and accent acquired by study in France, and German a little by some months' study of it in Germany, who is a good Pianist, now seeks a situation as **COMPANION** to a Lady, or to TEACH One or Two Little Girls, seeking rather a comfortable home of her own in this country than high salary. Address, S. E. B., Cavendish and Hutt, 21 Cuckspur Street, Charing Cross, S.W.

TO INVALIDS and others requiring an experienced and devoted **COMPANION, SECRETAIRY, &c.**, at Home or Abroad, a **GENTLEMAN, B.A.**, possessing every desirable qualification and as accomplished and first-class references, offers his services. Address, **ADAMS & SONS**, 15 Baker Street, Portman Square.

SANATORIUM.—**SUNBROOK PARK, Richmond Hill.** Physician—**Dr. EDWARD LANE, M.A., M.D., L.D.S.** For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—**BEDFORD HOUSE.**—Facing Sea and Esplanade. Near the West Pier. Central and easy. Long established. Select of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hall. **ROBERT PARK, Manager.**

ILFRACOMBE HOTEL, Ilfracombe, North Devon.—Delightful Location, Beautiful Scenery, 250 Rooms, Apartments perfect, Cuisine excellent, Wines choice. Accessible from all parts by Steam and Rail (see Time Tables).

MARGATE.—**THE CARLTON HOTEL**, facing the Sea, open all the year at one charge. Single Boarders, £3 5s; Lady and Gentleman, £5 5s per Week. Breakfast at 9 o'clock, 3s; Lunch at 1s; Dinner at 6s. Tea and Coffee served at 9 P.M. in a most splendid Drawing-room. The Drawing-room, with its ample Gallery, open all day from 10 A.M. to 11 P.M. A good Piano. To keep the Hotel very select references are required a few days before entrance. **R. KERR, Proprietor.**

MAIVERN.—**HYDROPATHY.**—**Dr. RAYNER'S ESTABLISHMENT** (formerly Drs. Wilson and Rayner). For prospectus apply to **F. RAYNER, M.D., Maivern.**

PUBLICATION of **EDUCATIONAL WORKS.**—All **AUTHORS** desirous of bringing their **WORKS** under the direct notice of the Scholastic Profession are informed that **RELIEF BROTHERS** have unusual opportunities of assisting them in this respect, as their Travellers, who visit the greater part of England twice a year, call on all the principal Educational Establishments in the Kingdom, and by this means introduce, in the most efficient way, all books committed to their care. Chart House Buildings, Aldersgate, E.C.

RODRIGUES' MONOGRAMS, ARMS, CRESTS, and ADDRESSES Designed, and Steel Dies Engraved as Gems. **RAISED, RUSTIC, GROTESQUE, and ECCENTRIC MONOGRAMS** artistically designed for any combination of Letters. **PAPER and ENVELOPES** stamped in Colour Relief, and brilliantly illuminated in Gold, Silver, and Colours, in the latest style of Art. At **HENRY RODRIGUES', 45 PICCADILLY, LONDON.**

THE ASTRONOMER-ROYAL Reported to the Admiralty (August 13, 1870) on 40 Chronometers entered for annual competition. "M. F. DENT'S is the finest we have ever had on trial."—**M. F. DENT, Chronometer, Watch, and Clock Maker** to the Queen, 33 COCKSPUR STREET, CHARING CROSS.

E. DENT & CO., 61 Strand, and 34 Royal Exchange, Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL and TURKISH CLOCKS. To Her Majesty, H.R.H. the Prince of Wales, and H.R.H. the Emperor of Russia; Makers of the Great Clock of the Houses of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogue on application.—**E. DENT & CO., 61 Strand, 34 Royal Exchange (adjoining Lloyd's), and Factory, Savoy Street, London.**

WILLIAM S. BURTON, GENERAL FURNISHING IRONMONGER, by Appointment to H.R.H. the Prince of Wales, sends a **CATALOGUE GRATIS**, post paid, containing upwards of 850 Illustrations of his unrivalled "Stock of

Electro Plating	Lamps and Gasaliers	Iron and Brass Bedsteads
Britannia Metal Goods	Tea Trays	Bedroom Cabinet Furniture
Dish Covers	Urns and Kettles	Dining- and Drawing-room
Hot-water Dishes	Clocks and Candelabra	Furniture
Glasses and Yenders	Table Cutlery	Chimney and Pier Glasses
Marble Chimneypieces	Baths and Toilet-ware	Turnery Goods
Kitchen Ranges	Bedding and Bed Hangings	Kitchen Utensils

with Lists of Prices, and Plans of the 30 large Show Rooms, at 39 Oxford Street, W.; 1, 2, 3, and 4 Newman Street; 1, 5, and 6 Perry's Place; and 1 Newman Yard, London, W. The Cost of delivering Goods to the most distant parts of the United Kingdom by Railway is trifling. **WILLIAM S. BURTON** will always undertake delivery at a small fixed rate.

MAPPIN & WEBB'S

A 1 SPOONS and FORKS.

MANUFACTORY AND SHOW ROOMS, THE ROYAL CUTLERY WORKS, SHEFFIELD. **COSTLY ILLUSTRATED CATALOGUES ON REQUEST OF 15 STAMPS.** **SMALLER EDITION POST FREE.**

PURE AERATED WATERS. **CRYSTAL SPRINGS and PUREST MAKE.** Under the highest Patronage of the Royal Family.

ELLIS'S CARBONATED SODA WATER.

ELLIS'S POTASS.

ELLIS'S LITHIA, and

ELLIS'S SELTZER WATER, and

CHAMPAGNE LEMONADE,

ALL PREPARED on a NOVEL and IMPROVED PRINCIPLE.

NO LEAD CISTERNS are USED at the **WORKS** of **ELLIS & SON.**

ELLIS & SON, RUTHIN, NORTH WALES.

CAUTION.—**ELLIS & SON** beg to call attention to the following important **TESTIMONIALS** which guarantee the absolute purity of all Aerated Waters manufactured by them.

ELLIS & SON'S AERATED WATERS. Analytical Laboratory, County of Denbigh, Well Street, Ruthin, September 4, 1874.

I hereby certify that the water I procured from your Works last week, and which is used in the manufacture of your Carbonated Waters, passed a most analysis to be perfectly free from any organic matter injurious to health, and the most delicate tests have failed to discover even a trace of lead or any other deleterious mineral.

J. J. BANCROFT, F.R.S.

Analyst of Food and Drink in the County of Denbigh.

To Messrs. **ELLIS & SON, Soda Water Manufacturers, Ruthin.**

ELLIS & SON'S AERATED WATERS. Medical College, London Hospital, the Laboratory, May 11, 1872.

GENTLEMEN.—I have to report to you the results of the analysis of the samples of water which you sent me for examination. The water was perfectly bright, and it was nearly free from colour when examined in large volume. The water is of good quality, and is well suited for domestic use.

(Signed)

H. LETHEBY, M.B.

ELLIS & SON'S AERATED WATERS. 37 Hatfield Street, May Fair, London, July 27, 1871.

GENTLEMEN.—I must apologise to you for my long delay in acknowledging and reporting upon the samples of your Artificial Waters which you sent me, owing to illness. I have employed a Chemist to ascertain for me the intrinsic purity of your water, which is as perfect as possible, and which as compared with those of a London manufacturer, are as pure white compared with him yellow.

(Signed)

M. DILLITT, M.R.C.P.

ELLIS & SON'S AERATED WATERS. Royal College of Chemistry, Liverpool, August, 1867.

SIR.—I have very carefully tested your Soda and Potass Waters, and find them perfectly pure. Water containing even a trace of organic matter (vegetable or animal) I have always recommended you to abstain from the introduction into the town of CATONIST water from Riverbank Lake. Your preparations I find healthy and delicious, and I daily recommend them to my friends. You are at liberty to make any use of this communication, should you consider it worthy of publication.

Yours respectfully,

SHERIDAN MUSPRATT, F.R.S., &c.

Messrs. **ELLIS & SON, Ruthin.**

Professor of Chemistry.

ELLIS & SON'S AERATED WATERS. 18 Upper Seymour Street, Portman Square, London, 4 March 24, 1863.

We have the pleasure of reporting the composition and quality of the Potass and Soda Carbonated Waters which you have analysed, and find them remarkably pure and strong in gas, the amount of which is equal from 15 to 16 times the volume of the liquid contained in each bottle, and ranges therefore from 25 to 275 cubic inches. The quantity of soda and potass in each bottle is equal to 15 grains (which agrees with the Pharmacopoeia of the Bicarbonate of either alkali).

The water in itself is absolutely pure, has no taste of organic matter, and is not liable to alteration or decomposition by being kept any length of time. It will prove most serviceable in all ailments of the urinary organs, in dyspepsia, in acid eructations, psoriasis, and other forms of cutaneous disease.

A. URK, M.D., F.R.S., Analytical Chemist.

L. THOMSON, M.B.S., Analytical Chemist.

ELLIS & SON'S AERATED WATERS. Extract from "Chemistry: Theoretical, Practical, and Analytical," by Dr. **SHERIDAN MUSPRATT, F.R.S., &c.**, pp. 110 and 1101.

About forty years ago, when the fabrication of mineral and spa waters commenced, a very violent opposition arose with regard to them, especially from the members of the faculty. They were said to be devoid of all the good qualities of the natural ones—to be minus a certain *quid vitæ quæ non in the shape of a spiritus rectus*, or vital force, which imparted the medicinal qualities. The Editor has lived to see such statements reversed. Chemistry, the great revealer of hidden treasures, has demonstrated to a certain extent what the constituents of the natural waters are; and thus one is now enabled to procure artificial waters quite equal, if not superior, to the natural ones. Now that the Chemist is able to distinguish the ingredients actually effervescent in a water, a much more active mixture than the native spring can be prepared. Messrs. **ELLIS & SON**, of Ruthin, prepare a beautiful imitation of the Seltzer Water, which, on being analysed by the Editor, yielded exactly the same constituents as the far-famed Bohemian Spring. The artificial is certainly more palatable than the natural water, owing probably to the freshness of the carbonic acid infused into it by the admirable apparatus used by Messrs. **ELLIS**. Some time ago the Editor was greatly pleased in inspecting the admirably conducted establishment of **ELLIS & SON**, at Ruthin, North Wales. Everything was so nice and clean, and so for the water employed, from a deep and splendid well upon the premises, it might be said to be absolutely pure; and it is on this account that he considers the soda, potass, and other beverages prepared in these works superior to any other in the market. The quantity of soda or potass in each bottle at Ruthin is fifteen grains of the bicarbonate of either alkali; and the carbonic acid is equal to about two hundred and fifty or sixty cubic inches, showing how well the gas is compressed. The water from the well only holds two grains of solid matter in solution, and has not a trace of organic matter; hence it is not liable to alter or decompose if kept for any length of time.

ELLIS & SON'S AERATED WATERS.

The Public are particularly requested to observe that every Cork is branded **R. ELLIS & SON, Ruthin**, and every Label bears their Trade Mark, Goat on Shield, without which none is genuine.

The Waters may be obtained from all respectable Chemists, Confectioners, and Hotelkeepers; and Wholesale only from

B. ELLIS & SON, Ruthin, North Wales.

SELTZER WATER for PARTIES.

ELLIS & SON prepare this deliciously pure and refreshing Beverage, in Quart Bottles, to meet the wishes of many of their Friends. It is much valued by Hosts and Housewives at Parties and Balls.

COUNT ARNIM'S IMPRISONMENT.

A PRACTICE has lately come into fashion among foreign diplomatists which is in the highest degree reprehensible. This practice is that of publishing, to suit their own private convenience, or, to gratify their own private malignity, documents which have come into their possession as the trusted servants of the State. The officials of the Second Empire may perhaps be credited with the distinction of having first invented or popularized this practice. Many of them had lived as adventurers in an atmosphere of adventure, and they looked on State documents as so many revolvers which, as they were in custody of them, they might as well put in their own private drawers on the chance of wanting to shoot some one some day. M. ROCHER kept a large number of these secret weapons of diplomatic murder in his own house, where they fell into the hands of the Germans. That M. ROCHER ever meant to make a bad use of them is not to be asserted or implied; but it showed an extraordinary laxity of official usages when it was possible that a Minister, after leaving office, should retain documents in his possession which belonged to the State, and of which an unscrupulous man might have made a dishonest use. M. BENEDETTI after the fall of the Empire took upon himself to divulge secrets with which he stated himself to have become acquainted in his diplomatic career, in order that, as he said, he might do himself justice. It so happened that he had nothing more to say than that Prince BISMARCK had befooled him, which was antecedently probable; but he tried to do all the harm he could. More recently the Duke of GRAMONT made his revelations, and published documents which were calculated to place Austria in a position of difficulty and embarrass its relations with Prussia. His revelations showed that Austria was strongly inclined to pledge herself to help France when the war with Germany was threatening; but this was perfectly well known to Prussia, and, as the policy of Austria had subsequently entirely changed, and her great aim was to be on good terms with Germany, Prince BISMARCK was quite content with what he had got, and no notice was taken of what Austria had been thinking of doing some time before. The crowning act of indiscretion, however, was that of General DELLA MARMORA, who, merely to enjoy the malicious fun of starting a quarrel between Germany and Italy, published an account of what had been talked of between him and the representative of Prussia at a period when the policy of Prussia was very undecided. Prince BISMARCK remonstrated in the strongest way with the Italian Government, and in fact called it to account severely for such an act of treachery being unpunished. The Italian Government expressed its deep regret, but stated that under the existing Italian law there was no mode of punishing the offender. It offered, however, to bring in a Bill by which such an offence as that of which General DELLA MARMORA had been guilty should in future be punishable criminally, and, the German Government expressing itself satisfied with this offer, the matter dropped. It was not necessary for the Italian Government to press for a reciprocal enactment, as the law of Prussia already made the abstraction of State documents a criminal offence, and it would probably have seemed to both parties in the highest degree unlikely that any Prussian official would be guilty of such an offence. If this, however, was the conviction of Prince BISMARCK, he has lived to see himself mistaken.

Count ARNIM has passed the best years of his life

in the diplomatic service of Prussia, and has held posts of the highest importance. He represented Prussia at Rome while the arrangements were in progress for the Vatican Council of 1870, and subsequently he was sent to Paris after the German war. The man who was selected to represent his country on two such occasions was necessarily a very distinguished and trusted public servant, and he became of course the confidant of Prince BISMARCK on many occasions, when the PRINCE's policy was not improbably shifting, and perhaps not over-scrupulous. For many years Count ARNIM and his chief were on the best of terms, but at length the PRINCE thought Count ARNIM was committing himself in a wrong direction. It was rumoured that Count ARNIM had been allying himself too warmly with the party which matured the stroke by which M. THIER'S was driven from power. This is only rumour, and the precise reason for Count ARNIM's being recalled was not officially divulged. To have divulged it would have been highly improper and contrary to all precedent. A diplomatist, when he enters the service, knows that he is always liable to be removed from his post if he does not satisfy his official superiors, and he must be content to suffer in silence if his recall has been unwise or unjust. At one time it was supposed that, in order to smooth his fall, Count ARNIM would be sent to the dignified exile of Constantinople; but for some reason or other the notion of Count ARNIM going to represent Germany at the Porte was abandoned, and he was left without employment, and in a state of great irritation against Prince BISMARCK. In an evil hour he took a method of vengeance which reduced him to the level of M. BENEDETTI and General DELLA MARMORA. He published, or allowed to be published, at Vienna copies of despatches which he had written from Rome to Prince BISMARCK. The only thing that these despatches showed was that Count ARNIM had from the outset had a keen and just appreciation of the policy of the Papal Court, and that he might be credited with having seen into the future earlier and more keenly than Prince BISMARCK. But the fact that confidential despatches should be published at all was held in Germany to be so disgraceful that the gossiping enemies of Prince BISMARCK, who, if they hear that the PRINCE takes off his boots before going to bed, are positive that he does so in some Machiavellian way and for some diabolical purpose, started the ingenious theory that Prince BISMARCK had himself published these Roman despatches in order to fix on Count ARNIM the terrible stigma of having betrayed diplomatic confidence. That Count ARNIM actually published these despatches was perhaps impossible for the German Government to prove, for they had been published at Vienna; but if Count ARNIM had resented, as he ought to have done, the notion that he could have been guilty of such treachery, he would have done his utmost to aid the Government in discovering the real offender. He remained silent and passive, and the German Government began to consider what was its position towards him. The first thing to know was, what despatches Count ARNIM had got. Prince HÖHENLOHE, who succeeded him at Paris, was directed to search the archives, and see whether all documents were there that ought to have been there. It was found that a large number were missing. Count ARNIM was called on to state what had become of them. As to some, he said that they were merely private documents as to his income and allowances, and that these did not concern the State at all, and that he had carried them off as part of his own property. As to others, he said that they were not official letters,

but confidential letters on diplomatic matters from Prince BISMARCK, that Prince BISMARCK had chosen to trust him, and had written to him, and that the letters were his letters, and he meant to keep them. As to others, he owned that they were State documents, but he protested that he had not an idea of what had become of them. Of all the missing documents he knew the whole history, except of those the abstraction or retention of which might make him criminally responsible. It was not likely that the German Government would be satisfied with such an answer. What owner of property would have been satisfied with such an answer? To avoid scandal, however, the German Government tried to bring about an amicable arrangement, and to induce Count ARNIM to give up the missing documents. He positively refused, and then the machinery of the criminal law was set in motion, and he was arrested.

This is of course the story of the German Government, as communicated to the world through the semi-official newspapers. But it has been thought very hard on Count ARNIM that, even if this story is true, he should have been arrested. This is an opinion which it is difficult to share. If the story is true, Count ARNIM appears to be by no means a martyr, but, on the contrary, a very culpable and reprehensible person. That any dirty trick is pardonable if it is done not for private gain, but for political objects, is a notion very widely spread, and has long been current in English boroughs at election times, but it is not by any means a healthy or wise way of looking at things. Whether it has been prudent and politic to let the law take its course against Count ARNIM is a different question. That is a point on which it is very hard to judge. Even well-informed Germans do not seem to know what to say as to the expediency of the step, and foreigners may therefore be content to say that they are no judges. Gossip says that a pamphlet is forthcoming for some of the scandal of which Count ARNIM has supplied the materials, and that Prince BISMARCK has only anticipated the blow that was to be struck against him. This is very probably mere gossip, and if the arrest is to be discussed on the ground of temporary expediency, the possibility of a pamphlet being published with revelations damaging to Prince BISMARCK does not seem enough to make the arrest prudent and politic. These damaging revelations do not generally hurt any one very much, and the meanness and dishonesty of the proceeding would have been so flagrant that a man so strongly placed as Prince BISMARCK was not likely to have been much injured. But, apart from questions as to the expediency of punishing it, the offence of which Count ARNIM is accused ought not to be considered a light one. In the documents of which Count ARNIM is stated to be in wrongful possession it is not very improbable that some strong and unpleasant things were said about Italy, for Prince BISMARCK'S Italian policy has notoriously varied at different times. Supposing these documents to be published by Count ARNIM or with his connivance, the Italian Government might justly complain, for it was made by Germany to pass a Bill punishing criminally such acts of treachery. Ordinarily, of course, a Government can do nothing until publication has actually taken place, and cannot be blamed for not having acted before. It will say that it had no knowledge that State documents were in wrong hands, and that it could not believe that a man of high station would be guilty of dishonesty. But in this case the Italian Government would reply that the German Government did know that there were strong grounds for believing Count ARNIM to be illegally in possession of documents that did not belong to him, and that it did know what he was capable of, for he had already published confidential despatches at Vienna, or had connived at their publication, which, as throwing light on the character of the man, comes to the same thing. In short, assuming the alleged facts to be true, Count ARNIM does not appear to us to deserve the slightest commiseration, and the German Government is setting a useful example in showing that it will not overlook a political crime even in a man of high rank and consideration. But whether, for the purposes of current politics, his arrest has been prudent and expedient is a question of which probably no one except Prince BISMARCK himself knows enough of all the circumstances to judge; and, with all his knowledge of the circumstances, Prince BISMARCK may have come to a wrong decision.

THE NORTHAMPTON ELECTION.

THE result of the Northampton election would have been more satisfactory if Mr. FOWLER had been returned. The Conservatives have every right to rejoice in the success of their candidate; but at present the party which most requires encouragement is that of the moderate Liberals. For the time the Government is strong enough; but there is no Opposition which could safely assume the responsibilities of office. The adherents of Mr. BRADLAUGH or of Mr. CHAMBERLAIN happily still form a minority in the constituency; but it would be a grave misfortune if any considerable section of the Liberal party were either to accept Mr. CHAMBERLAIN'S tendered alliance or to identify themselves with the rioters of Northampton. The country will be in an insecure condition when unqualified faith in Mr. DEERLE becomes the only alternative of revolution. Mr. BRADLAUGH has employed considerable abilities and respectable attainments in propagating opinions which are altogether inconsistent with the existing structure of society. In more than questionable taste he has denounced with coarse ridicule the religious opinions of the great bulk of the community, and he announces himself as a Republican of the extreme Jacobin species. It is not a pleasant discovery that household suffrage has produced in Northampton nearly eighteen hundred voters who would, if they had the power, destroy not only the Monarchy, but the institution of property; but nothing can be more natural than that the resentment of an anarchical faction at their defeat should, in spite of the prudent renonstrances of their leader, express itself in acts of violence. A Northampton Commune would probably emulate the performances of its prototype at Paris. Mr. BRADLAUGH once excusably teased a reporter of an American paper by elaborate statements of the resources which would enable him on the next vacancy in the Crown to establish a Socialist Republic. It is highly improbable that he entertains any treasonable designs of that or any other kind, but his rhetorical language may perhaps be accepted seriously by a turbulent rabble. Demagogues, like organic parasites, indicate the existence of morbid substances of which, as Mr. PLAYFAIR lately said at Glasgow, it may perhaps never be determined whether they are a cause or a consequence.

The inveteracy of the habit of talking party cant is illustrated by the comments of more than one Liberal newspaper on the return of a Conservative candidate for Northampton. Mr. BRADLAUGH is charged, not with the advocacy of mischievous and ruinous doctrines, but with the stale and conventional crime of dividing the Liberal party. It would have been as rational for the representatives of orthodoxy in the eighteenth century to complain that VOLTAIRE, to the great advantage of Protestants and other heretics, divided the Catholic Church. It is incredible that writers in the *Daily News* or the *Telegraph* should really believe their own tacit assumption that the abolition of religion, of monarchy, and of property are articles of the Liberal creed. If the avowed opinions of the leaders of the party, or the well-known convictions of its members, are entitled to even approximate credence and reasonable consideration, Mr. BRADLAUGH is not a tolerated dissident, but an irreconcilable adversary, of Liberalism. To divide parties which are already separated by an impassable chasm is an imaginary achievement. It was a question of expediency for Mr. BRADLAUGH and his adherents whether they would lose or gain more by a public exposition of their numerical strength in the borough of Northampton. It is also possible that, calculating with too sanguine a confidence on the stupidity of their Liberal adversaries, they hoped that the wolf would be admitted into the fold, though he scarcely troubled himself to adjust his sheepskin decently. If respectable journalists call Mr. BRADLAUGH a Liberal, he cannot be blamed for adopting the designation, as long as it suits his purpose. On the whole, although he has been disappointed in his reliance on the credulity of the Liberal party, Mr. BRADLAUGH has little reason to regret that he persisted in going to the poll. There is no reason why he should prefer Mr. FOWLER to Mr. MEREWETHER, or Mr. GLADSTONE to Mr. DISRAELI. His followers were perhaps slightly unjust in attacking the houses and offices of the local Liberals, who, after all, proved that they had a better right than the Communists to represent the Opposition. Nevertheless the revolutionary faction has shown that it is in some degree formidable. The

votes which were given to Mr. BRADLAUGH will be disposable for the purposes of Mr. CHAMBERLAIN'S negotiations with the Liberals.

Of the total number of 5,773 votes, Mr. MEREWETHER received 2,171, Mr. FOWLER 1,836, and Mr. BRADLAUGH 1,766. It may be taken for granted that, if no Liberal candidate had appeared, of the whole number of Liberal voters a portion would have abstained, and the remainder would have supported Mr. MEREWETHER. It is therefore absurd that the supporters of Mr. BRADLAUGH should complain of the division of the Liberal party, while it is probable that the Radical votes would have turned the scale in favour of Mr. FOWLER if Mr. BRADLAUGH had withdrawn. The Liberal electors deserve credit for not allowing disappointment and probable defeat to provoke them into a dishonest sanction of the candidature of Mr. BRADLAUGH. The change in the representation of the borough must be extremely annoying to the party which was formerly dominant. In the last Parliament Northampton was represented by a Whig gentleman holding the anomalous rank of an Irish peer, and by a Dissenting Radical of the school of Mr. CORDEN and Mr. BRIGHT. Mr. GILPIN once published, and perhaps wrote, a pamphlet in support of the principles of the Peace Society, for the purpose of proving that it would cost less to submit to a French conquest than to commit the wicked and costly act of resisting the invader by arms. The follies which were fashionable or possible twenty years ago have become obsolete and harmless; and Mr. GILPIN subsided into the position of a minor functionary in Mr. GLADSTONE'S Government; yet it seems probable that his constituents were rather strong than moderate in their Liberalism, though they laudably shrink from the startling theories of Mr. BRADLAUGH. It would have been well if their courage and consistency had been rewarded by a proof that they were still numerous enough to return a representative of their own principles against both the regular Conservatives and the anarchical faction. Although it is probably useless to tender advice which may clash with party interests, the Conservatives would act wisely in supporting moderate Liberals against revolutionary opponents. The return of Mr. FORSTER for Bradford at the head of the poll was a severe rebuke to factious politicians.

Before the Northampton election it was not unfrequently suggested that the return of the Socialist candidate would effectually extinguish a troublesome demagogue. It is true that Mr. BRADLAUGH would in the House of Commons have found a level, perhaps even below his legitimate pretensions. The House is not easily stirred by windy declamation, and in its present constitution it profoundly dislikes extreme opinions. Subversive agitation in Parliament will for some time to come be impracticable, but it is not desirable to record the approval of Mr. BRADLAUGH'S principles by even the most ignorant constituency. A demagogue who is powerless in the House of Commons may nevertheless exercise additional authority over a disaffected rabble when he is known to be a member of Parliament. There is no immediate danger of a successful attack on the great institutions of the country, but it would be a melancholy innovation that England should, like some Continental countries, enter on an epoch of struggle for the maintenance of the freedom and order which have hitherto been matters of course. In such a contest, agitators of the order of Mr. BRADLAUGH would, among other results of their violence, perform the function for which France is indebted to such politicians as RANC and ROUFFORT, and Spain to the Federalists and the Carthagena insurgents. The great mass of the French population would prefer the Empire, or perhaps even the Legitimate Monarchy, to the supremacy of LÉON ROLLIN, or of the leaders of the Commune. A Republic would perhaps have been already established if the Jacobins and Socialists had not, like Mr. BRADLAUGH with the Liberals of Northampton, divided the Republican party. The advantage which the Conservatives have on many occasions derived from the obstinacy of the ultra-Radicals is but too likely to encourage the reactionary tendencies of the less enlightened section of the party; yet it would be an error to suppose that the more intelligent constituencies object to Liberal doctrines because they reject the opinions of Mr. BRADLAUGH.

THE REGENT'S PARK EXPLOSION.

THE explosion of gunpowder at Regent's Park has subjected a considerable part of the population of London to some of the experiences of a bombarded city. It was

as if the enemy had sprung a mine in the night, and the wide area over which the wave of destruction may be traced attests the terrible violence of the shock. The most alarming feature of the catastrophe, however, grave as it is, is not so much the actual ruin which has been caused as the possibilities of disaster which are suggested to the imagination. It is now realized that London has hitherto been exposed at any moment to the most fearful devastation, and that it is only an accidental circumstance that the consequences of the explosion of Friday last were not infinitely more serious. The impression which has been produced on the public mind by this event may be expected to lead to some useful results, but it is melancholy to reflect on the apathy and indifference with which previous cautions have been received. Forewarned is said to be forearmed, but the clearest knowledge of the danger of moving large quantities of gunpowder did not induce any special precautions in inland transport. To adopt a favourite phrase of our time, "the whole subject" was under the consideration of Government; and while questions more or less doubtful were debated at tedious length, measures obviously and indisputably necessary were delayed. The manufacturing, storing, and moving of gunpowder and other explosives are treated "exhaustively," as pedants love to say, in two Blue-Books of last Session, in which everything was said that could be said on the subject, while nothing was done. Major MAJENDIE, R.A., made a Report to the Home Office, dated May 16, 1872, in which he stated and proved that "the regulations as to the conveyance of powder by water are quite inadequate to prevent accidents." He made a further Report on April 1, 1874, and thereupon a Select Committee of the House of Commons was appointed to hear Major MAJENDIE say all that he had already written, and to hear also all that the "trade" and the carriers had to say on the other side. The time of this Committee was chiefly occupied with discussion as to the making and storing of explosives, while the duty of legislating as to transport was admitted and postponed. Considering that the Report fills 370 pages of a Blue-Book, it is surprising that the Committee could not find space or time to make a practical proposal. They merely recommend that Railway and Canal Companies shall have power to frame bylaws for regulating the loading and carriage of explosives, the place, time, and mode of loading, amount to be carried, and "necessary precautions," and that the exercise of this power should be superintended and enforced by the Home Office. This is rather a poor result of an elaborate inquiry. There is a complete classification of explosives, new and old; witnesses were patiently heard and fully reported in dissertations upon the commercial value and harmless character of dynamite; but the difficult question how far regulation of traffic can be carried without destroying trade or inducing evasion was treated with strange indifference.

The householders of Regent's Park, sitting among the ruins of their dwellings, may console themselves by reading the Blue-Book which contains Major MAJENDIE'S neglected warnings. His evidence dwelt chiefly, as might have been expected, on controverted points. The manufacturers disputed the necessity of some regulations which he proposed, and they, being a rich and powerful interest, occupied much of the attention of the Committee. The only witness called on the special point of carriage was Mr. THOMAS KAY of the London and North-Western Railway, and he had nothing very particular to say. A general regulation of all the Railway Companies provides that "gunpowder in kegs, barrels, or wooden cases must only be carried in gunpowder vans," but it does not appear that any special precautions are taken in loading or discharging these vans. The barrels or casks when taken out of the vans are set down on the ground in the ordinary way. The Railway Companies have, however, recognized the necessity of taking at least some precautions, but other carriers seem to have utterly disregarded the dangerous character of their operations. A covered cart is required by law for more than thirty barrels of gunpowder; but there is nothing to require that the cart shall be properly made inside by the exclusion of iron, or by being tight-fitting, &c. "A cart," said Major MAJENDIE to the Committee, "conveying gunpowder is practically a movable magazine, and it is quite clear that the precautions taken in magazines ought not to be neglected in carts, especially as the cart, unlike the magazine, is moving through populous places. Similarly with regard to barges; they are under no restrictions with respect to their construction. In fact, the argument applies with greater force to barges, because barges may carry up to 500 barrels;

"whereas the quantity conveyed in a cart is, of course, much more limited." Nothing could have been said to call the attention of the Committee more pointedly to the danger of carrying gunpowder in barges, but nothing was done by Parliament to regulate this practice, and now it has resulted in a deplorable calamity. This neglect to take practical precautions is the more culpable because the traffic in gunpowder and other explosives has become so large that carriers may with no great inconvenience observe special regulations in dealing with it. At Liverpool, where there is a special Act of Parliament on the subject, it is believed that gunpowder is not allowed to come into the town at all; but it does come into London, and is loaded largely at various railway goods depôts surrounded by population. The quantities conveyed depend upon the liveliness or otherwise of trade. In 1870 immense quantities of gunpowder and other explosives were conveyed through the metropolis in open vans covered with tarpaulin from the different railway stations to Blackwall, and thence transferred from land to water carriage. On the 27th of December, 1870, fifteen vehicles loaded with barrels of gunpowder, about twenty tons, were sent from Camden Town to Blackwall Stairs (a densely populated place) to be shipped off. The whole of the loaded vans were detained in the street for some time waiting for the arrival of the barge to take on the cargo. The operations being in compliance with the requirements of the law, the police had no legal power to interfere. These facts were stated by the Superintendent of the Thames Police in answer to inquiries addressed to him by Major MAJENDIE. "I beg to submit," he said, "that such a number of vehicles loaded with gunpowder passing through a crowded metropolis, and of necessity detained in the street for some time, must be attended with great danger to life and property." It is easy to understand that at the period referred to the trade in gunpowder was pretty brisk, and those concerned in it thought only of getting their business done as quickly as possible. So the dangerous load was passed on by carts to Blackwall, and fortunately for London this gunpowder exercised its destructive power elsewhere.

The practice of transferring gunpowder from land to water carriage, and *vice versa*, at public landing places—namely, Wapping Dock Stairs, High Street, Wapping, Bow Creek, and Blackwall Stairs—has been carried on for many years, but generally in conformity with the regulations of the Gunpowder Act. It is a common and perhaps inevitable practice for men to be standing about smoking their pipes while such transfers are being made; and the evidence just given at the inquest shows the extreme recklessness with which not only smoking, but fires, are allowed on barges carrying powder. Major MAJENDIE says that the powder-barrels are generally well made; but shrinking is possible, and blows and falls have been known to occur, and a small leakage forms a train by which the entire mass of powder in cart or barge may be fired. The precautions adopted in the Army and Navy in handling powder contrast forcibly with the carelessness of civilians. It would be well if London were exposed to no greater danger than that of tumbrils, in charge, we presume, of soldiers, passing along Oxford Street. The police officer before quoted mentions an instance of a train of carriages containing in the aggregate twenty tons of powder travelling all at once through London, and this is probably the usual practice. The existing law limits the quantity to be carried in one van, but there is no limit to the number of vans that may go in a line. It is admitted, however, by Major MAJENDIE that when precaution is taken, it may be better to send forward the entire quantity that may be on hand at once, and get rid of it. He insists that all explosives carried should be duly labelled and declared, and carriers should combine with the public in urging this requirement. "The evidence with regard to sending large quantities of dynamite as slate, in Wales, and the carrying of nitro-glycerine, as much as 10 lbs., in a passenger carriage, is exceedingly unpleasant," says Major MAJENDIE, "and discloses a very unsafe and unsatisfactory state of things." As regards gunpowder, it is manifest that such a quantity as five tons, if conveyed by water, ought to have been placed in a barge specially constructed for the purpose; and if this had been done, the recent explosion would to all appearance have been avoided. The practice of the Railway Companies goes far to fix moral responsibility on the Canal Company for not adopting any precaution similar to that of the "van air-tight and built very strongly" which Mr. KAY de-

scribes. This duty was the more incumbent on the Canal Company because there is manifestly a large and regular trade in blasting powder between London and the Midland counties. It may be interesting to Londoners to know that their city is the great emporium of foreign trade in explosives, and vast quantities are also sent from the manufacturing factories through London to the mining districts.

In the year 1862 an Act "for the safe keeping of petroleum" was passed by Parliament; and the provisions of the Act of 1860 as to searching for gunpowder are incorporated with this Act, and are to be construed as if the word "gunpowder" included petroleum. It will be found, however, that this Act provides for the case of petroleum being brought in a ship into a harbour, or being placed in a warehouse, but not for that of its being carried in a barge along a canal either with or without gunpowder in the same cargo. Parliament probably intended to protect the public against all the dangers likely to arise from the importation of petroleum, but it only provided against some of them. There is a provision in the Gunpowder Act of 1860 that no gunpowder shall be conveyed in any barge or boat not having a close deck, and any gunpowder conveyed otherwise than as the Act prescribes may be seized. But this enactment is not of much practical value after an explosion. It may be inferred that, as Parliament considered gunpowder dangerous, and petroleum dangerous, it would have considered a combination of these two articles doubly dangerous, but there is no express provision applicable to such combination. "Petroleum may be searched for in the same manner," says the Act, as gunpowder, and of course if they are placed in the hold of the same vessel, this enactment might be conveniently carried into effect. There is an Act of 1866 "as to the carriage and deposit of dangerous goods," but it has not, so far as we know, been extended to petroleum, and, even if it had, it would only provide that a carrier should not be bound to carry that article. On the whole, the intention of the Legislature to do something is manifest, but unfortunately the Legislature occupied itself during the last Session with explosives of another class. A small portion of the time occupied in debate on the "burning question" of Ritualism might have sufficed for the humble but useful task of empowering the Home Office to require Railway and Canal Companies to make proper regulations for the carriage of gunpowder and dynamite. Even if there had not been time to make complete arrangements as to vans and barges, the vigilance thus aroused would probably have prevented the disastrous explosion which has now occurred.

MR. CHAMBERLAIN ON THE LIBERAL PROGRAMME.

MR. CHAMBERLAIN'S Sargument in the current number of the *Fortnightly Review* may perhaps convert some Liberal adventurers to his opinions. It is possible that he may be right in his judgment that extreme proposals have a better chance of ultimate success than applications of the recognized principles of the Liberal party. Some of the late Ministers have at different times intimated their conviction that party interests were the proper object of political exertion; but sometimes they have thought that the return of the Liberals to power will be most effectually promoted by passive expectation, although the leaders ought at the proper time to be ready to appreciate and echo a popular cry. Mr. GOSCHEN and some members of the party less eminent in position have lately solaced themselves with the contemplation of obvious Ministerial blunders, and of the personal differences which are undoubtedly to be found in the Cabinet. Mr. STANSFELD, while he was still in office, repeatedly dwelt in his speeches on the necessity of perpetually providing some new attraction on the boards of the Liberal theatre. Whether the new piece might lead to the moral and intellectual improvement of the audience was a question of secondary importance, provided that applauding crowds could by any means be collected. The general election corrected some misapprehension as to the profit to be gained by perpetual novelties. The English nation, if not Conservative, is slow, and it is puzzled by incessant shifting of the scenes. Mr. CHAMBERLAIN acutely remarks that the late Government, through a deficiency in the sense of proportion, worried all classes by proposals of change which, even when they were for the better, were not

always worth the trouble and disturbance which they caused. "There has been too much 'nagging' in legislation, and the Imperial Parliament, which, like the elephant's trunk, can pick up pins or rend an oak, has gathered pins enough to fill a lady's reticule." Even when proposed readjustments were not altogether trivial, they were often gratuitously unseasonable. Mr. GOSCHEN probably lost the Government several seats by a superfluous suggestion that all the landed estates belonging to corporate bodies should be sold, and the proceeds invested in personal securities. As no measure of the kind was at the time under the consideration of the Cabinet, it was totally unnecessary to threaten powerful bodies with wanton confiscation. The Liberal leaders were, with scarcely an exception, misled by the success of the Irish Bills of 1870 and 1871. They exaggerated both the public confidence in themselves and the popularity which seemed to be easily earned by tampering with established institutions. They are now warned by a writer who is rather an independent ally than a supporter, that the enthusiasm of the multitude is only to be roused by bold appeals to its interests and its passions.

Mr. CHAMBERLAIN is himself in no sense a political adventurer, nor indeed is he careful to conceal his contempt for the speculative proselytes whom he hopes to rally to the cause of subversion. It is not his immediate purpose to prove the expediency of destroying the Church, of confiscating landed property, or of effecting still more sweeping changes to which for the moment he has no occasion to refer. His appeal is virtually addressed to trading politicians of the Liberal party, who, while they would probably desire to counteract all Mr. CHAMBERLAIN'S efforts, may nevertheless be willing for sufficient consideration to co-operate in his revolutionary schemes. It has always been held that a belligerent may lawfully avail himself of the services of a deserter, whom he rewards with the stipulated payment, while he is not bound to accord him his respect or esteem. Mr. CHAMBERLAIN'S essay on Liberal policy is vigorous and perhaps persuasive, and it bears marks of literary cultivation and taste; but in substance it amounts to the offer of a bribe, while it defines the conditions of an alliance between the extreme Radicals and the Liberals who at present shrink from the measures tendered for their acceptance. The bargain is to be of the simplest kind. The late Ministers and those who share their opinions will be welcome to resume office if only they will abandon all claim to determine the policy of the party. When they have destroyed the Church, redistributed property, and perhaps abolished the House of Lords and the Crown itself, they may possibly find that their associates may be inclined to administer the affairs of the State which they will have remodelled. There is no reason why Mr. GOSCHEN should be preferred to Mr. CHAMBERLAIN as the future Prime Minister or President. By a rhetorical artifice which is pardonable because it has no tendency to deceive, Mr. CHAMBERLAIN tacitly assumes that the Liberal party is pledged to the principle of change, and not merely to the definite changes which have for the most part been already accomplished. The extension of the suffrage and the institution of the Ballot were only applications of the doctrine that the power of the majority ought to be universal, and the influence of property discountenanced. On Mr. CHAMBERLAIN'S principles, consistency requires that the same object should be still pursued until it is fully attained.

For the present purpose it was not necessary to classify the demands of the ultra-Radicals according to their relative importance or urgency. Addressing an audience which is supposed to have no fixed opinion or conscientious conviction, Mr. CHAMBERLAIN examines the question of the existing institutions which it would pay best to attack in the first instance. Although he is generally a candid disputant, he is not superior to the commonplace fallacy of applying a single laudatory epithet to all the various innovations which he desires to introduce. The adjective "free" has acquired certain favourable associations, and it is therefore in its various senses used in controversy to describe any system which it may be thought convenient to eulogize. Mr. CHAMBERLAIN is an advocate of "free land," "free Church," "free schools," and various other things combined by the common attribute of freedom. It matters little for rhetorical purposes whether an impressive word conveys a definite meaning. A free Church is equivalent to a sect or sects without endowment; free land implies the transfer of the freehold from the owner to the

occupier; and free schools represent the absence of payment by the parents, and therefore a gigantic endowment provided at the public expense. All these things may for the sake of argument be admitted to be good, but they have nothing in common except that they have all a democratic character. It may perhaps be right that churches should be supported by voluntary subscription, and schools by general taxation, involving absolute control by the State or by some delegated authority; but endowment and prohibition of endowments cannot be accurately described by the same term.

Mr. CHAMBERLAIN is for various reasons of opinion that, looking exclusively to its own interest, the Liberal party cannot at present advantageously commence an agitation either for the further extension of the franchise, or for the more important object of a redistribution of electoral districts. Either measure, or both in combination, would absolutely and finally disfranchise the classes which have hitherto exercised political power. In time the constituencies may perhaps be cajoled or frightened into a surrender; but it would be rash to begin the struggle when a general election has resulted in the accession of a Conservative Government. The establishment of absolute tenant-right, or, in other words, the arbitrary transfer of the fee simple of land from the landlord to the tenant, would, in Mr. CHAMBERLAIN'S opinion, be the most beneficial of all changes; but the farmers are for the moment rather afraid of the Unions than hostile to their landlords; and it may be added that the advocates of confiscation will do well to wait for precedents of plunder committed by capitalists with the sanction of landowners. The Associated Chamber of Commerce only the other day sanctioned a proposal that the Railway Commissioners should have power to repeal, in accordance with the doctrines of the Wisconsin Granges, all the existing Parliamentary tariffs. If a silly Minister should be supported by thoughtless county members in adopting the piratical project, it is difficult to understand how the precedent could be disputed when it was afterwards proposed to make the occupier of land a freeholder. On the whole, Mr. CHAMBERLAIN concludes that the next Liberal campaign may with the greatest prospect of success be undertaken against the Established Church. Many millions of booty, and the gratification of innumerable spites and jealousies, would ensure the support of many zealous partisans to the Liberal assailants. On this question Mr. CHAMBERLAIN himself is not wholly dispassionate. The zest with which he recalls the foolish utterances of a few ignorant and perverse clergymen indicates his antipathy to a Church which will assuredly not be rendered more reasonable or more tolerant by disestablishment. In some instances clergymen who use insolent language to Dissenters are themselves professed advocates of disestablishment. Social position and competence have no direct tendency to make men vulgar, conceited, or pugnacious. The Irish priests who have no endowments use more abusive language in a week than the outlying fanatics of the Establishment in a year. Gentlemen, as a rule, are not foul-mouthed, though religious malignity may sometimes overpower the restraints of position and education. The Liberal party will have leisure to weigh Mr. CHAMBERLAIN'S offers of support. Those among them who are wholly exempt from conscientious scruples may probably be inclined to close with his proposals. No discredit will attach to the purchaser who buys venal politicians in open market.

FRENCH ELECTIONS.

WHEN both sides claim the victory it is usually safe to assume that the battle has been very nearly drawn, but the rule will hardly hold good in the case of the elections to the French Councils-General. The Republicans deserve to have their successes suspected because their journals made a great deal too much of the first indications of the result which reached Paris. When 1,400 elections are held on the same day, and the greater number of the successful candidates are men unknown beyond their own canton, it would take time to appreciate their opinions even if the elections turned on purely political issues. But in this case it is impossible to say how far local considerations came into play. In England political passion has often determined municipal contests, but since the Ballot it would be difficult to predict whether political passion would lead a Liberal to vote for a Town Councillor of his own party supposing that he knew him to be unsound upon the price

of gas. In France the number of electors who take no interest, or at all events no part, in politics is much larger than in England, so that in municipal contests great allowance has to be made for the appearance at the poll of a body of voters who will care little whether a man is a Monarchist or a Republican, provided that he has property in the neighbourhood, and that he will undertake to secure for his canton its full share of any good things that may be going. Even in the elections to the Assembly considerations of this kind exercise a considerable influence, and in elections for a local Legislature which has no concern with politics except in the improbable contingency of the Assembly being dispersed by violence, their influence is legitimate as well as considerable. After all people must live, whatever be the form of government in favour at Versailles. They must get their crops to market whether the taxes which have to be paid out of the proceeds go into a Republican or into an Imperialist treasury, and if they are to get their crops to market they want old roads mended and new roads made. Why should they anticipate the verdict of a general election by sending to the Council of their department a man who knows nothing about roads, or worse, wants to have a road made in the wrong place, merely to read a lesson to the Assembly or to Marshal MACMAHON? They care so little for politics that they often do not vote at the election of a deputy, and there can be no reason why at the election of a man to manage the affairs, not of the nation but of the department, they should suddenly profess a patriotism which they have not displayed on more appropriate occasions. In the absence, therefore, of any definite news about the elections of Sunday last, it is safe to say that, though a Republican victory would have been very significant, a Conservative victory is of very small import. Throughout the rural districts the man best fitted to look after local business will often be a Monarchist of some shade or other. It does not follow that the peasant who voted for him last Sunday would be equally ready to vote for him if he came forward at the next partial election. It is only men who have nothing to lose who are it is impossible to distinguish between local affairs and national affairs, or think that because a man is a good Republican he is necessarily a good man of business. A candidate for a Council-General asks the electors to appoint him their agent in a variety of matters which nearly affect their pockets. Prudent voters will want some better qualification for this office than a certificate from a political Committee.

The elections of the 9th of October have done little therefore to gratify the curiosity which is felt in Paris as to the issue of a general election, supposing that the Conservatives are driven into trying the experiment. Before the Council-General were returned the contests for the rather dwarfed elections for the Assembly which are to be held on Sunday week. Now that they have proved somewhat barren in political significance, the interest in the filling up of the three vacant seats in the Maritime Alps, in Seine and Oise, and in the Straits of Calais has revived. In the second of these departments the only anti-Republican candidate is the Duke of PADUA, and the supporters of the Government will have to make up their minds how large a dose of Imperialism they can swallow in order to defeat a Republican. The Duke's address to the electors is perfectly frank. The qualifications on which he rests his canvass are purely Imperialist. He reminds them that he was Prefect "during the difficult" "period from 1849 to 1852"—the period of the *Coup d'Etat* and the proclamation of the Empire. He was made Minister of the Interior by NAPOLEON III., and on the 16th of March last he was chosen as the interpreter of French feeling to NAPOLEON IV. These are his claims as regards the past. As regards the future he is ready to confer on Marshal MACMAHON all the powers which are necessary for the maintenance of public order and the defence of social interests. But the MARSHAL'S term of office is limited, and the Duke of PADUA thinks it essential that every candidate for a seat in the Assembly should state frankly what is the Government he wishes to see established when the legal delay is at an end. His own desire is to see the son of NAPOLEON III. placed on the throne of his father by the direct expression of the national will. The return of Imperialist deputies will by degrees create in the Assembly a majority prepared to recognize the national sovereignty—which even now is only questioned by such adversaries as the authors of the criminal enterprise of the 4th of September—and to vote the Appeal to the People. It has become a fashion with the Orleanist

journalists to blink the fact that a candidate professes devotion to the Empire and to speak of him as purely Conservative. They can hardly apply this process to the Duke of PADUA. If the overthrow of the Empire on the 4th of September was criminal, the subsequent ratification of that overthrow by the National Assembly must have been equally criminal. After his experience of M. BERGER'S address the MINISTER of the INTERIOR will not hastily pledge himself to the illegality of any statement which a Bonapartist candidate may choose to make; but it will be impossible for the Government to promote the Duke of PADUA'S return unless it is prepared to admit that the vote of the Assembly has been virtually cancelled. It certainly was not the intention of those who joined in that vote that the Empire was to be regarded as merely excluded for a term of years, and that at the end of this term the nation would once more be asked whether it wished a BONAPARTE to rule over it. Yet if the Government is not willing to go this length, it has only to make its choice between defeats. How can the Septennate be so universally acceptable to Frenchmen as its organs declare it to be if in an important department no candidate presents himself for election whom it can recommend its friends to vote for? In Maine and Loire the Government had the courage to start a candidate of its own, and when the Imperialist candidate was withdrawn, it had only to solicit the votes which had been given for M. BERGER in the first instance. It will be a much greater descent to have to ask its own supporters to vote for the Bonapartist candidate as the nearest approach to a supporter of the Septennate that can be started with any chance of victory. If the line taken by the Ministerial organs with regard to the election in the Straits of Calais is any guide, the Government will not shrink when it comes to the point from swallowing even the full-blown Imperialism of the Duke of PADUA in Seine and Oise. They have applied to the contest in the former department a convenient theory by which the Bonapartists are divided into two classes, those who demand an immediate appeal to the people and those who are willing to wait for this consummation of their hopes until the Septennate has run its course. The former class must be opposed wherever they are met with, the latter may be accepted as friends and fellow-workers during the interval which they do not desire to disturb. The merit of this division is, that it leaves the friends of the Government free to treat as pure Conservatives every candidate who does not insist on taking a plebiscite for NAPOLEON IV. without a moment's delay. It is needless to say that no such candidate is likely to come forward. The Imperialists are a great deal too shrewd to wish to blow up the Septennate too soon. They know that it is their best friend, and that it would be suicidal as well as ungrateful to get rid of it, even supposing that they had the ability to do so. If the Appeal to the People were conceded at this moment, the Imperialists would probably vote for keeping Marshal MACMAHON where he is. Until the pear is ripe the power of shaking the tree is not worth scheming for. In one respect the address of the Duke of PADUA stands in marked and favourable contrast with the addresses of the Orleanists. He tells the electors plainly what he wants after the Septennate. It would be a curious revelation if every Orleanist candidate could be made to say truly what he wants after the Septennate. The Imperialists go in for Marshal MACMAHON now and NAPOLEON IV. to follow. The Orleanists go in for Marshal MACMAHON now—and what to follow? The policy of the Imperialists is intelligible. They see that the Empire has been damaged by the events of 1870, and they are glad to have a breathing time allowed in which their cause can be thoroughly white-washed. But what do the Orleanists expect to get when the Septennate has come to an end? If they hope to restore HENRY V., why not restore him at once? If they hope to set up the Count of PARIS, why are they afraid even to hint at their designs? Six years is not too long for a canvass for a throne, and if the Bonapartists think it time to be stirring, the Orleanists, who have more loss way to make up, can hardly be well advised in giving no sign.

COUNTY SPEECHES.

AT this time of the year, when the harvest is over, when little is going on, and London is not detaining great people from the company of their rural neighbours, agriculturists of every class love to get together, to eat and drink, and indulge in the innocent recreation of listening to speeches from county members or popular noblemen.

They generally got at least sound sense, practical knowledge, and kindly feeling in the speeches to which they listen; and this is not only all that they want, but exactly what they want. Formerly there was always one ground of difference to be avoided, but now this has ceased to exist, and everything is harmonious. There used to be two sides in politics, and Conservatives and Liberals had to bear in mind that, if peace was to reign, they must all try honestly to think and talk of cows and corn, and not to stray into dangerous topics. Now there are practically no political divisions. The Conservatives are in office, and the Liberals are for the most part very glad to see them there, and there is scarcely a political question that can be mentioned on which Conservative and Liberal county members hold differences of opinion because they belong to different parties. Parties, at any rate in quiet districts where the notion of galvanizing a party with a new cry does not trouble the minds of men, are much the same now; and it is perhaps true that, as Lord GEORGE CAVENDISH said lately at one of these dinners, politicians are very much the same as other men. He has had a very long experience of the House of Commons, and has seen a great many statesmen rise to eminence and go in and out of office. His general conclusion is that eminent politicians are very like other men, only that they have some excellence or other that gives them a superiority. This excellence is, however, a varying one. Some statesmen can speak; others can invent measures; others understand how to wait and keep quiet; others have an instinctive perception of what other men want and like. As instances Lord GEORGE CAVENDISH adduced Lord ARTHUR and Lord MELBOURNE, in whom, as he was in the neighbourhood to which they had belonged, his audience might be supposed to be specially interested. Lord ARTHUR not only was not a great speaker, but he was as bad a speaker as a man can be who, after all, does make a speech; but he was the first and last of eminent Liberal politicians who carried the Tory squires with the sympathy if not in voting. He was beloved and trusted by his political adversaries, and used to hunt with them and live with them, and preferred their company to reading official letters, which he used to allow to stand over until he liked to read them. What had he beyond ordinary men of his class that made him eminent? He had in a remarkable degree the charm of character which wins friendship, and this gave him a unique position at a time when party differences were very high; but there was nothing in it to mark him off as a distinct person from common men. In the same way Lord MELBOURNE was Prime Minister for many years, and Lord GEORGE CAVENDISH had had many opportunities of examining closely what it was that carried Lord MELBOURNE to the top of the tree. He observed that, in the first place, Lord MELBOURNE was extremely good-looking; next, that he never did anything he could help doing; then, that he was perfectly unaffected, and owned to a fervent love for boiled beef and tripe; and, lastly, he behaved in a gentlemanly way to his rivals, and on quitting office he gave Sir ROBERT PEEL all the information about the Court that he thought would be most useful. These were all good things in their way, but they did not make Lord MELBOURNE a man apart and of a special kind. Had it been consistent with the scope of his remarks to mention men of the present day, Lord GEORGE CAVENDISH might have noticed that the two great parties are now led by men who are of another stamp, and who are conspicuously unlike county members. But he might also have added that this is accidental, and that, as a rule, parties are not led by men of any exceptional position or genius. A survey of the front benches of both sides of the House of Commons certainly countenances the supposition that, when the days of the present leaders are over, what was true formerly will be true again, and that political eminence will be merely due to the possession, in a degree rather beyond the average, of those qualities which are to be found in the ordinary leaders of town or country society.

The chief point of interest for agriculturists to discuss at present is the state of the agricultural labourer, and Lord CARNARVON has lately addressed some very sensible remarks to his Wiltshire neighbours on this subject. One advantage of the mode in which land is held and worked in England is that the landlord is in a position to take a friendly view of the difficulties and struggles of the labourer. It is the farmer who has the hard bargaining, who suffers from laziness and insubordination, who has to command, and is often tempted to bully, those whom he

employs. The landlord from a loftier station looks impartially on the contending parties. He watches and pities the poor, and gladly does all he can to help them so far as he can without interfering with the farmer. Some landlords honestly wonder that, when so much is done for him, the agricultural labourer can think he has any grievances. He has allowances which greatly increase the real amount of his wages, and there are numberless clubs, societies, and institutions, of which it is his own fault if he does not take advantage. This was the view, for example, which was urged with considerable force by Mr. BENYON at the recent gathering in Berkshire. Lord CARNARVON took a wider and a truer view. He recognized that we are in an age of transition, and that the labourer can no longer be treated as a mere dependent, to whom, if he behaves well, little acts of kindness are to be done. The labourer wishes in these days to be more independent, to have his own humble standing, to know exactly what he is bargaining for. Payments, Lord CARNARVON said, must sooner or later be made all in cash, and not partly in cash and partly in kind. The labourer must be allowed to make his contracts for the work he is to do, and not be merely kept alive and told to do this and that. The true way, in Lord CARNARVON'S opinion, of benefiting the labourer in these days is to help him to attain this position; and to this end the country can contribute by insisting on the labourer receiving in childhood the best education compatible with his station, and landlords can contribute by taking care that the adult labourer is decently housed and has a garden, if possible, to give him occupation and interest. Mr. BENYON showed quite as much kindly feeling towards the labourer as Lord CARNARVON did, but the divergence in the general drift of what they said was considerable and important. Both proceeded on the assumption that in England personal relations lie at the bottom of social arrangements, and that it is to the increasing justness of these relations, and not to any great legislative changes, that those who wish well to the agricultural labourer should look. But Mr. BENYON represented the ancient, Lord CARNARVON the modern, view of regarding the relations of the landlord and the labourer. To make labourers happy dependents was the aim of Mr. BENYON; to give labourers within reasonable limits the happiness of a modest independence was the aim of Lord CARNARVON; and it is not going very far to say that the field of Mr. BENYON'S thoughts was the past, while the field of Lord CARNARVON'S thoughts was the future of the English agricultural poor.

There is another subject which in a smaller way has a real interest for the more thoughtful members of country society. It is on the agricultural labourer that recruiting for the army in a large degree depends. It does not depend on him so largely as it did formerly, but we must still in a great degree look for supplies to the rural districts. How things are going on in this respect is therefore a question which very properly claims the attention of those who do not forget the interests of a kingdom in the interests of a county. In addressing his Berkshire friends Colonel LORD LEXISBY expressed the great anxiety with which he was oppressed when he saw the kind of recruits now obtained. In everything that money can buy for soldiers our army is the first in the world. It is better armed, equipped, fed, and dressed than any other army; but unfortunately the inside is not so good as the outside. The man is not up to his uniform. The new recruits are but a poor lot; they are weakly, and often of indifferent character, and soon show that they hate soldiering, and desert by thousands. A strong sturdy labourer will rub on if he can at home, and if he cannot he will emigrate. But he declines to enlist. Emigration is, on the whole, in Lord CARNARVON'S opinion, a mistake for the labourer. Lord CARNARVON has been Colonial Minister, and he ought to know something of the colonies; and as to specious schemes for enticing Englishmen to foreign countries, he could appeal to the melancholy history of the Brazilian emigrants, whose misfortunes were so inevitable that he had done his utmost to deter the victims from rushing on their fate by giving them a public warning of what they had really to expect. If the labourer has the position secured to him which Lord CARNARVON thinks possible and desirable, he will be well off and happy at home—better off and happier than he is likely to be anywhere else. This may be so; but the prospect, if good for the labourer, is very bad for the re-

cruiting sergeant. If labourers now, with their grievances real and imaginary, refuse to enlist, and prefer to put up with all they have to endure at home, or even to emigrate rather than enlist, it stands to reason that they will have still less taste for soldiering when they have got a nice cottage and a good garden, and are making contracts in an independent way for the work they have to perform. The physical inferiority of English soldiers is therefore likely to increase rather than diminish; and if England wants to have an army capable, so far as its numbers go, of matching a first-rate Continental army, it must do, in Colonel LORD LANSBY'S opinion, one of two things—it must either introduce a conscription, or it must go on paying more and more to the soldiers until it can make the stamp of men it requires look on soldiering as a really good investment. If war came, and England suffered a serious defeat, we might possibly be induced to accept some form of conscription as a necessity. But if peace continues, we shall certainly prefer to see what money can do to get us the army we want; and it may be confidently expected that there will be a great increase in the Army Estimates if, after a sufficient time has elapsed to test the experiment of the present system of recruiting, the best authorities concur in pronouncing it a failure.

ARBITRATION AND SOCIAL SCIENCE.

ARBITRATION and kindred topics connected with international law have become, as was natural, an indispensable part of Social Science, which may itself be defined as rhetorical commonplace. It would have been too much to expect that the advocates of arbitration should be satisfied with a week's recent enjoyment of their favourite pastime at Geneva; and, as one of the members reminded his unfortunate Glasgow audience, the Social Science Association had long ago referred the subject to a Committee, a single member of which had consequently written a volume of six hundred pages on international law. This speaker added the gratifying statement that Mr. DUDLEY FIELD'S International Code had been translated for the benefit of those whom it might concern into French and Italian. It is perhaps not surprising that after his labours in the municipal litigation of the City of New York Mr. DUDLEY FIELD should find recreation in the more theoretical study of international law. It seems that his Report concludes by suggesting precision in the terms employed in the great international code. "There are to be three great subdivisions of the entire system—"The Law of Nations," "International Law," which might have been supposed to be the same, and "The Municipal Law of Nations," which corresponds to private international law. As municipal law is generally understood to mean the law of single political communities, the confusion incident to social science is happily introduced by applying the term to law which is not municipal. The author of the Report is of course careful to explain that, although international law has neither judicial nor executive organs, it is a reality in the sense in which metaphors have a substantial existence. "The conscience in the individual has its counter-part in the nation." In other words, international law is analogous, not to law, but to conscience, which is but of figuratively legal obligation. In another Section of the Association the subject was discussed by a representative of the Society which has assumed to itself the title of International. The abolition of all classes, as recommended by Mr. BARRY, would perhaps simplify the relations of States which would practically have ceased to exist. The amiable and respectable managers of the Congress may perhaps have begun to suspect that in inviting all men to talk about everything they have played with edged tools. The proposition that "the working classes are the masters of the world" is an alarming result of social science.

Sir EDWARD CREASY had the merit of reducing the theory of arbitration to the absurdity which is its logical consequence. It would appear that Sir EDWARD CREASY is not himself a fanatical believer in the universal operation of the modern nostrum, for he quoted the authority of Mr. DUDLEY FIELD to show that a claim might be made so grossly unjust as not to be a matter for argument or for litigation. It was quite unnecessary to quote a writer whose authority is perhaps not conclusive in proof of a statement which has received the most notorious confirma-

tion from recent experience. No party to an arbitration will ever exceed in cynical audacity the agents of the United States, who demanded from England some hundreds of millions sterling on a transparently fraudulent pretext; but if the submissive deference of the English negotiators at Washington should hereafter be reproduced, it is possible that subservience may again be followed by insult. Sir EDWARD CREASY further showed from Vattel and other jurists that an award might be so unjust as not to be binding, and he has since explained that the issue of injustice would be decided by a supplemental arbitrator; but there would be great inconvenience in refusing to abide by the decision of even a Geneva Tribunal. The defeated litigant must have concurred in the selection of the arbitrators, and he is therefore in some degree responsible for any miscarriage which may result from their incompetence. On the whole, it must be assumed for the purposes of discussion that litigants will not be extravagantly unreasonable, and that Courts of Arbitration will discharge their duty. The question remains, how their sentence is to be enforced against a contumacious defendant. Sir EDWARD CREASY replies that it is the duty and the right of all nations to treat as an enemy any State which grossly outrages international law. With entire consistency he adds the recommendation that the chief Powers should bind themselves by treaty to make war on any State which refused to obey an award, unless indeed it were palpably unjust. Thus, if the Geneva Tribunal had entertained and sanctioned the indirect American claims, it would have been the duty of Russia, Austria, Germany, and France to make war upon England, in case of a refusal to pay to the United States the greater part of the cost of the Civil War. The exception in the case of grossly unjust judgments would constitute the Powers into a Court of Appeal which would have heard neither the arguments nor the evidence in the case. It is at least as probable that two or three great military Powers might adhere to an unjust award as that it should be delivered by a Court which might be assumed to have some regard for its own character.

It is strange that intelligent persons should be so entirely absorbed in the pursuit of theories as to be utterly blind to the preposterous results of their own deductions. The scientific socialists probably listened with undisturbed complacency to the proposal that belligerents should remain at peace while disinterested neutrals made war on their behalf. In 1853 no Court of Arbitration would have decided that Russia had a right to invade Turkey because the Greeks and Latins at Jerusalem, instigated respectively by Russia and France, had engaged in a disreputable squabble about the keys of the Holy Sepulchre. It is still more certain that no Geneva award would have prevented the Russian army from crossing the Pruth when Lord ABERDEEN and Mr. CORBEN had succeeded in convincing the Emperor NICHOLAS that nothing would provoke England to war. It would, on Sir EDWARD CREASY'S theory, have become the duty of Austria and Prussia to send their armies to expel Russia from the Danubian Principalities, while France and England peaceably expected the event. If the neutral Powers had failed to discharge their duty, the theory of coercive arbitration would have exhausted its possibilities. It is certain that at that time Austria and Prussia would not, in compliance with any rule of international law, have undertaken an intervention which they declined when it would have obviously preserved the peace of Europe. Sir EDWARD CREASY, who once wrote a book on the "Fifteen Decisive Battles of the World," is probably aware that not one of them, from Arbela to Waterloo, could have been prevented by any possible system of arbitration. In a few cases of doubtful right, when two unwilling parties engage in a quarrel, there has never been any difficulty in arranging a reference to arbitration. No prudent Government would invite the authority of an international tribunal if it were understood that ambitious bystanders might claim a right to enforce by arms an award which perhaps might be flagrantly unjust or ruinously inadmissible.

To religious wars, to wars of conquest or of revenge, and to civil wars, the theory and practice of arbitration are utterly inapplicable; and it seems to be admitted that when war has once begun, arbitrators have nothing to do with the conditions of peace. During a period of fundamental disturbance, such as the years which followed the French Revolution, and during the active lifetime of NAPOLEON,

the system of arbitration would have been necessarily suspended. It is absurd to suppose that in 1866 either Austria or Prussia would have accepted the arbitration of any Court on their rival claims to exercise supremacy in the German Confederation. Great wars are for the most part undertaken for the purpose, not of determining, but of altering, existing rights. It may be assumed that arbitrators would be bound by the terms of any treaty previously concluded between the litigants with reference to the subject of dispute. If France were to threaten Germany with war as the alternative of restoring Alsace and Metz, neither party would entertain any doubt that the provinces were formally transferred by the Treaty of Peace of 1871. The arguments on either side might be founded on considerations of expediency or moral right, and they would assuredly lie outside Mr. DUDLEY FIELD'S International Code. It would be interesting to ascertain whether the new code includes a definition of the cases in which a foreign Power has a right to aid either party in a civil war. If a German contingent were to join the army of SERRANO, the approval of a Court of Arbitration would have little tendency to allay the jealousy of France. The French expedition to Mexico was, as the result proved, in the highest degree impolitic, but the Government of the United States insisted on the withdrawal of the auxiliary troops, not because their presence was a violation of international law, but because it was distasteful to a neighbouring Power which had the means of enforcing its own policy. The dreary disquisitions on arbitration which recur whenever social science supersedes for the time more instructive and more amusing studies are at present conducted under peculiar difficulties. The Geneva litigation has, through the perversity of one of the disputants and the eccentricity of the tribunal, illustrated almost exclusively the vices of the system. In England the whole theory is for the present unpalatable; and no other considerable State has taken the subject into serious consideration.

THE FLIGHT OF THE IRISH CLERGY.

THE man who described Ireland as the pleasantest country in the world to live out of seems to have been taken for their prophet by a good many of the disestablished Irish clergy. To precisely how many this applies it is not easy to say. The "Layman" whose letter appeared in the *Times* of Tuesday says that over seven hundred curates were ordained in the few months of grace allowed by the Irish Church Act, and that all these at once took advantage of the permission to compound, and have since come over to England to seek their fortunes. As this same permission was extended to the whole clerical body, it may be supposed that older men who had more to gain by the process did not always forego it. "Another Irish Layman," whose letter was printed on Thursday, thinks that the extent of the migration has been much exaggerated, and he seems to show that the 700 ordinations alleged to have taken place in 1870 must be reduced to about 120. But he does not deny the most startling of the statements contained in the first letter. We there read that in order to obtain the right of compounding "many youths of 21 and 22 were ordained by special licence." "Another Irish Layman" says, by way of correction, that "not more than 30 or 40 were so ordained in all Ireland," and that "it was always done legally." Certainly we did not suppose that the faculty required by the rubric was not obtained in these cases. The wonder is that any one should have been found to grant it. Knowingly to ordain a man under age for the sole object of giving him a claim to the capitalized value of a curacy would be a fraud upon the Church, whose minister he never meant to be, and upon the State, which had never intended to recognize so visionary a vested interest. If the Irish Bishops wish to preserve the good opinion of Englishmen, they will have to explain their part in this amazing transaction. More than one of them must have had a hand in it, for it is not probable that the whole thirty or forty unfledged parsons were taken from a single diocese. Experience has not led us to look for a very exalted standard of ecclesiastical propriety in the Irish clergy, but such a misuse of episcopal power would go beyond all that could have been anticipated.

Putting aside this especial incident, there is not much in the migration which seems to call for either surprise

or censure. When the clergy who have left Ireland for England are viewed in the aggregate, it may appear shocking that they should have had so little love for the Church in which, down to its disestablishment, they had purposed to live and die. But each of them had to decide in his own case and for his own circumstances, and, when looked at in this isolated way, it is easy to imagine plausible excuses for the step. It is not denied that the staff of clergy in the Established Church of Ireland was larger than the Disestablished Church could afford to support, and that many parishes in which, so long as the connexion with the State was maintained, it was necessary for form's sake to keep a clergyman without a congregation, must in future dispense with so purely ornamental an officer. Once admit that the number of clergy had to be considerably reduced, and each man who wished to leave would naturally think that he might as well go as another. A Church the machinery of which had been framed on a scale sufficient to cover the whole country had been compelled to recognize her true position as the Church of an unequally distributed minority. Would it not be better for her that the clergy required to serve the diminished area should be chosen from those who wished to take office under these changed conditions without reference to the particular circumstances of their benefices? Perhaps indeed it is giving some of the emigrants too much credit to assume that they thought about the interests of the Church at all. But, if so, it would be hard to say that the Irish Church has any one but herself to blame. The secular side of her position had been so exclusively kept before the world that it is not strange if her ministers appreciated the change which their own secular position had undergone more keenly than any professed identity in their ecclesiastical position. There has never been much in the spiritual aspect of the Irish Church to excite enthusiasm. She made few converts from Roman Catholicism, and the few she did make were of a kind, and obtained by means, which her more prudent members preferred to keep in the background. The sense of belonging to a clergy professing to minister to a people the great majority of which would have nothing to say to them, and contentedly acquiescing in their position, was not so ennobling that a man would care to give up an annuity in order to retain it.

Even if the past history of the Irish Church had been calculated to encourage self-devotion in the clergy, her action since disestablishment would have effectually quenched it. It was pointed out at the time that if "compounding and cutting" were to be avoided, the efforts of the Church must first of all be directed to remaking the same body that she was before. Instead of this, the object of successive Synods has apparently been to destroy her identity as fast as possible. The time seems to be coming when the Irish Church will have nothing left to do but to cry, with the old woman in the nursery rhyme, "Sure enough, and sure enough, this be none of I." Not even the littledog at home will know her. In so far as an Irish Clergyman foresaw and disliked this metamorphosis he had a perfect right to leave. His position in the Church had been seriously altered by disestablishment. He had no longer the safeguards afforded by the immobility of Parliament in ecclesiastical matters. Instead of the slow processes of courts of law, he had to look forward to the swift action of an ecclesiastical assembly armed with full powers to reconcile conflicting and to override unpopular decisions. He had not even the protection which in a similar case he would have had in England, the protection of equally balanced parties. In Ireland the party which wishes to revise the Prayer Book far outnumbered its adversaries among the laity, while among the clergy the opposition is too much a matter of prudence and traditional feeling long to resist the will of those on whose liberality the pecuniary future of the Church largely depends. An Irish Clergyman whose letter appeared in the *Times* of Thursday describes this state of things very accurately. He says that on the question of revision the clergy and the laity are opposed, but that, as the election to all vacant parishes will be in the hands of the laity, the clergy can expect very little promotion except on terms of servile obedience to those who appoint them. With this power in their hands the laity will not be long in bringing the other two orders to do their bidding. The minority against change will grow smaller every year, until at last the less resolute of those who dislike it will argue that it is no good waiting until a few

more revisionists have been elected to parishes, and that the inevitable surrender may as well be made at once. There is certainly the best possible ground for that "vague" "dread of the future" which has led "L.B.," and, he feels sure, "will yet lead very many more, to leave Ireland "for England."

This migration of the Irish clergy is not without its bearing on the state of affairs in the Church of England. We have said that five years ago the Irish clergy found that they had exchanged the immobility of Parliament for the swift action of an ecclesiastical assembly. The experience of last year raises a doubt whether Parliament itself is not about to exchange its immobility for a more than ecclesiastical promptness. If the same temper is to dominate in the coming debates upon Church matters which was conspicuous in the House of Commons during the progress of the Public Worship Bill, it will soon be as difficult in England as it is in Ireland for a clergyman to say of what sort of Church he will find himself a minister a year hence. We are already promised a strict, if a one-sided, enforcement of the rubrics, and the operation of the Act has been significantly postponed in order to give Convocation an opportunity of doing a little revision in the meantime. Probably, the common sense of Englishmen will not long endure the anomaly of allowing a clergyman to declare his belief in words from the pulpit, while forbidding him to express it in gestures when he has left the pulpit. In that case the assurance given last Session that sins of doctrine shall hereafter be put on a level with sins of ceremonial will shortly be made good, and in the Long Vacation after next, at latest, Convocation will be considering how to use another day of grace so as to make sermons as well as ritual square with the views of the House of Commons. Before that day comes we may be sure that a large number of clergy will wish to "eat," and will regret that they have not the choice of compounding as well as cutting. It will become the plain interest of an active section of the Church to have the exodus which they will see to be imminent soothed like that of the Hebrews by a series of perpetual loans. Of course this consideration is not one which will have any weight with men who supported the Public Worship Act from motives of duty. But it is possible that among those who voted for it there were some who did so merely to restrain a movement which they thought likely to shorten the days of Church Establishments. They may now see in Ireland what comes of attempts to narrow the boundaries within which the clergy have hitherto been confined.

TRAVELLING COMPANIONS.

IT is pretty generally recognized that few ties in life are more trying than that which unites a couple of travelling companions. It is probably from a perception of this fact that the modern practice of wedding tours has become so common. As a gun is tried by firing a charge greater than will ever be used in practice, so the strength of the marriage bond is at once subjected to the most trying combination of circumstances attainable. It is creditable to the strength of the domestic affections that so many couples return upon decently good terms, and are even known to look back upon the ordeal with feelings akin to regret. When, however, the bond is not of so intimate a nature, the number of failures bears a large proportion to the successes. Men are to be found who will declare that they have laid the foundation of permanent friendships in such temporary companionship. In some cases the statement may be accurate, though memory is apt to play queer tricks in such matters. Two men will come home from a trip barely on speaking terms, and a year afterwards each of them will be persuaded that his companion was perfect but for some trifling defect of temper, and they will be ready to renew their old alliance. A few days' separation obliterates all traces of the silly little grievances which were so serious at the time; and it may well be that the friendship which was temporarily endangered is permanently strengthened by the net result. The philosophical observer should therefore endeavour to make a note of his impressions on the spot in order that he may avoid such illusions. The study both of oneself and one's neighbours under such conditions is amusing and profitable. The principle is of course simple enough. The smallest pebble in your shoe may become extremely vexatious in a day's walk, and may at the time give far more annoyance than is compensated by the grandeur of the scenery. You will, however, remember the scenery and forget the pebble. In the same way, any little angularity in your friends or yourself may produce a petty irritation which very shame forces you to ignore when its cause is removed. You may be travelling, for example, with your dearest friend, a man who shares your opinions, who has been your guide in speculation and practice, who has stood by you in difficulties, comforted

you in sorrow, and even, it may be, lent you money in distress. Unluckily, he has some little trick of manner or language which you never noticed at home. He keeps some pet phrase which is always recurring in season and out of season; there is something about his manner of eating which strikes you as not perfectly delicate; he has a trick of echoing the last words of your sentences; and after a time the recurrence of the objectionable peculiarity vexes you like the sting of an insect. You feel that he has cancelled for the time all claims upon your gratitude. Orestes and Pylades may be patterns of friendship; but if in a walking tour Orestes should introduce into every other sentence the phrase "Don't you know?" Pylades would be ready to cut his throat or drop his acquaintance in a month. Benvolio, as Mercutio informs us, quarrelled with a friend for cracking nuts when he had hazel eyes; and the cause was perfectly adequate if they were fellow-travellers. A habit of cracking nuts might easily become an intolerable grievance. The sound is in itself annoying; and if Benvolio had weak teeth his friend's performance would become a kind of constructive insult. The special offensiveness of such peculiarities is that civility forbids you to mention them, and that you feel that your friend is absolutely unconscious of the annoyance he is giving. You have not, therefore, even the satisfaction of feeling that you have a right to discharge your vexation in the shape of resentment.

There are, of course, many pachydermatous persons to whom such grievances are unintelligible, but even the most stolid of mankind becomes sufficiently sensitive to other forms of annoyance. It is amusing to watch the proceedings of a party of three or four travellers who have been together for some two or three weeks. They sit down for an after-dinner chat, apparently on the most friendly terms. Presently one of them makes a seemingly harmless remark about the weather or the country. The bystander, though he is not in the secret, immediately perceives that the statement has some hidden application. A kind of thrill runs through the companions of the speaker; each man is, so to speak, standing to his arms and preparing for a general action; the signal gun has been fired, though we do not as yet know what may be the precise issue involved. The speaker, it is probable, is introducing some crotchet of his own which has become a recognized battle-ground. The question has been argued a dozen times already, and each combatant knows everything that each of the others has to say upon the subject. Perhaps, however, the introducer of the topic has thought in the course of the day of some clever logical manoeuvre which will give him his revenge for former defeats; or perhaps he sees a possible ally in his new audience. In the last case, it will be wise to preserve a strict neutrality and allow the struggle to run its natural course. The stolid man plods steadily on with his old offensive thesis; his argumentative friend takes up the challenge at once, and cuts in with a vigorous confutation; and the nervous and reserved man, after trying for some time to preserve a judicious silence, suddenly takes fire, and, dashing into the thick of the fight, becomes more noisy and irritating than all the rest of the party. And so the controversy rages till bed-time, and the endless debate as to the merits of two rival inns or the comparative merits of the high-road and a short cut is once more adjourned, to be resumed on the first convenient opportunity. In after years the combatants will look back with genuine fondness to the delightful conversations which used to take place over a quiet evening pipe when the day's work was finished. To the impartial spectator at the moment nothing is obvious except red faces, strained voices, and a general disposition in the disputants to look out for the most irritating and irrelevant topics. A different phenomenon is indeed equally common. We may frequently observe a party which has not even the spirit to get up discussions. It has been formed on the principle that people who are familiar at home are likely to make the best companions abroad. Two or three men join for a walking tour who have been sitting opposite each other every day for the last ten months at a college table, or obeying the voice of the same Whip during a Parliamentary Session, or sitting in the same Courts, and attending the same mess. They are too familiar, and too tired of each other, to care for an argument. One of two things generally happens to such combinations. Either the companions sit gloomily staring at each other in profound silence, making desperate efforts to blow into a flame some feeble spark of conversation about the wine list or the railway time-table; or, if more sociably disposed, they once more chew the cud of the old "shop" which they talk during the rest of the year. A couple of friends may be seen resting during the ascent of a mountain, and settling who is to have the next silk gown, or affecting to look at a picture gallery whilst really demonstrating to each other how a slight change the terms of a motion might have altered the fate of a Minister. It is a delicate question whether absolute silence or a recurrence to the very topics from which you want to clear your brain is the most painful indication of weariness. In either case, though such persons are probably peaceable in their external demeanour, it is not to be too hastily inferred that they do not heartily bore each other. There are certain eternal subjects for mutual irritation which inevitably present themselves. As in the smallest State there are Conservatives and Radicals, so in every travelling party there is the great distinction between the punctual and the dilatory. If only two men are travelling together, it is practically certain that one of them will be thrown into a fever of impatience if he is not at a station half an hour before the time fixed for the train; whilst the other, if not systematically late, will perhaps annoy his companion more effectually by always

contriving to be in time at the very last moment. One again will be seriously vexed if an extra half-franc has been given to waiters; and another will declare that no economical measure is worth the inconvenience which it causes. One man has an insane desire to see the sun rise on all possible occasions, and the other is sensibly resolved to lie in bed until extracted by something like physical compulsion. It is an open question whether these differences are produced by the fact that every one is disposed to select for his companion some one of contrasted qualities, or whether they are developed by a natural process of differentiation. A man, for example, becomes less punctual as he finds that he can depend upon his companion, and his growing irregularities make his companion more nervous than before. In any case they provide material for the constant bickerings which amuse the cynical observer. It is pleasant—though we do not say that the pleasure is precisely moral—to watch the yellow faces and dishevelled condition of persons landing from a rough sea passage; and such undignified satisfaction would be considerably heightened if one could see how heartily the companions who have spent some six weeks together welcome the period of their deliverance, so that their delight at being rid of each other often sheds a fictitious glow of cordiality over the parting.

The moral drawn from such observations by some experienced persons is that a traveller should always go alone. We cannot, however, quite accept the conclusion. A man may become quite as great a bore to himself as anybody else can be to him. He may have the happy faculty of striking up temporary acquaintanceship with chance companions; but, to say nothing of the very unattractive nature of many of the companions thus forced upon one, it is really easier for the member of a party than for a solitary traveller to make friends. If three complete strangers are brought together, it is generally a difficult task for them to discover what may be their common subjects of interest. If two are companions, they can at any rate start some discussion which may give an opportunity to the third to join in the conversation. The fusion of a society is more quickly effected when some of the constituent atoms have already entered into combination. And, therefore, in spite of all the petty vexations which one must expect to suffer from one's best friends, we hold that on the whole it is wiser to take a companion or two. It is true that we shall find out each other's weak points; that, unless we are of angelic temper, we shall establish certain mutual raws; and that we shall very likely be more quarrelsome on the last day of the journey than on the first. But we have always the satisfaction of remembering that nothing is easier than to drop a friend when we are at home; and that probably the extreme absurdity of our codes of conduct will appear in a humorous light after a brief period of absence, and that we shall then feel that, if fellowship in travelling produces some temporary irritation, it also strengthens some permanent bonds of union.

THE GOTHS.

THE mind which occupies itself at once with things present and with things past is liable to be now and then a little startled by sudden transitions from one to the other. Every one has heard the saying, not a particularly wise saying, that there was more to be learned from one number of the *Times* than from all the works of Thucydides. But what would have been the judgment of him who uttered that saying if he had been called on to compare a number of the *Times* with all the works of Procopius? The comparison would at least be more to the purpose, in so far as to talk of all the works of Procopius, of whom we have several distinct works extant, is less absurd on the face of it than to talk of all the works of Thucydides. We will not undertake to weigh a number of the *Times*, especially at this time of the year, against the Gothic, Vandal, and Persian Wars, the Buildings, and, in some eyes the most precious of all, the Anecdotes. But this much is certain, that any one who turns suddenly from the reading of Procopius to the reading of his daily number of the *Times* is liable to be a little startled. He is indeed liable to be even more startled than he who turns to the *Times* from his reading of Herodotus or Thucydides, unless indeed that number of the *Times* happens to contain a speech by Mr. Lowe. We are not drawing on the imagination; we are recording the experience of one, perhaps of a small class, who thinks that his study of the affairs of the nineteenth century need not shut out all regard to the affairs of the sixth, and who deems that a study of the history and topography of Rome is imperfect without some knowledge of one of the most striking events even in the long history of Rome herself—the mighty siege of Wittiges, the

by defence of Belisarius. Our sympathies are divided as we read the tale. Our hearts cannot fail to be drawn to the camp of that heroic race in whom we rejoice to hail men whom it is hardly an exaggeration to call men of our own blood and speech. We feel with men striving to guard the realm of Theodoric, the realm of him under whom Rome was happy, from a boasted deliverer who came to give her peace and freedom, such peace and freedom as were to be had when she had exchanged a Gothic King for a Byzantine Exarch. And yet our hearts cannot fail to be drawn too within the walls of the beleaguered city; we are dazzled by the still abiding fascination of the Roman name, a name to which strangeness and incongruity seem only to give a new kind of fascination, when the Old Rome is won back to the allegiance of the New, when Cæsar Augustus sits

enthroned not by the Tiber, but by the Bosphorus, when he is no more the long-descended offspring of Venus and Anchises, but a barbarian adventurer from the banks of the Danube, sent by a strange mission to restore the dominion and to codify the law of the ancient Emperors and Consuls. The magic of the Roman name has not the less influence when the Roman host is made up of hirelings of every race and every speech, save only the Latin and speech of the Seven Hills themselves. And if our sympathies of kindred lead us into the camp of the besiegers, our personal sympathies lead us even more strongly to the palace on the Palatine Hill which was the dwelling-place of Rome's defender. If we hold with Aristotle that the greatest general is not he who positively does the greatest exploits, but he who can do the greatest exploits with a given army, we must place Belisarius above Alexander and Cæsar, above Hannibal himself. If Belisarius had won an empire for himself instead of winning back an empire for an ungrateful master, he might perhaps have held a higher place than he does on the tongues of men. Like so many other great men, he has been the victim of a legend; the tale of the blind beggar has done something to overshadow the fame of the conqueror and defender of Rome. It was a strife between a man and a nation; as once Hannibal stood against Rome, so now Belisarius stood against the Goths. The slave of Theodora and Ananias can hardly claim a place among the greatest of men; but the embodiment of every military virtue in its highest form, the dauntless courage, the ready-witted skill, the ever-watchful care, the unswerving loyalty against all temptation and all ingratitude, the general humanity and kindness, which are united in the character of Belisarius, all join to place him at the very head of his own era, at the head of men who are great as generals, but hardly great in any other character. We feel perhaps a kind of regret, a kind of sense of injustice, that qualities so noble should have been thrown away on the service of a mere or a phantom. But we cannot keep back our sympathy; if we do not rejoice, we at least admire, as the calm courage of the hero, at the head of a motley band of mercenaries, battles all the efforts of a nation, and that a nation of our own blood.

In the second stage of the war the personal interest is felt as keenly on the Gothic as on the Roman side. Totilas was in every way a worthy adversary for Belisarius himself. But the two heroes were never in the same way directly matched with one another. At least they are not directly matched in arms; in another way they are more truly matched when Totilas spurs Rome to answer, not to the prayers, but to the warning of Belisarius. Two such men clearly understood one another. The King of the Goths, and the man who, but for his own unwavering loyalty, might have been King of the Goths instead of him, stand out among those men who make us proud of our species. Yet both belong to classes of men which have passed into proverb of contempt. What after all was Belisarius, in spite of his Slavonic birth and his Roman consulship, but a Greek of the Lower Empire? What was Totilas, what was Theodoric himself, but a mere Goth? When we have formed our notions of a Goth from Procopius and Cassiodorus, it certainly is a little startling to see what kind of ideas seem in the columns of the more modern oracle to attach to a name which we are beginning to learn to reverence. If anybody has been destroying the monuments of Delhi or any other place, whether with hammers and chisels or plaster of Paris, or in any other way, let him by all means be called some bad name. Only what is a bad name? When we look at the ruins of Rome, when we learn their history, when we read the edicts by which the Goth Theodoric strove to keep the Romans from destroying their own antiquities, we might think of calling such a one a Roman; we should never think of calling him a Goth. We might be inclined to put him in the same class as a Roman baron, as a Pope or a Pope's nephew; we should not dream of putting him in the same class with the King who spared the buildings of Rome and with the King who restored them. In this matter of destroying and preserving monuments, we may be tempted to think, with Liutprand, that Roman is the very worst name that one can call a man, and assuredly Goth is the very best. For a man with these thoughts in his mind it was something of a shock a little while ago to take up a copy of the *Times* in which there was a letter, written in the very staidest style in which a letter could be written, in which the correspondent, who signed himself "J. S. Laurie," complained that damage was being done to certain ancient buildings in India by the process of taking casts. If the facts be so, nothing can be more reasonable than the complaint, if it had only been put in reasonable language. But some people would think themselves degraded for ever if they stooped to say anything in reasonable language. They must talk in the grand style, they must bring in some allusion, some metaphor, some roundabout way of saying everything, or their character for fine writing would be lost for ever. So Mr. Laurie, after expressing his astonishment, the most reasonable astonishment, at finding things of this kind done at all, goes on to say:—

My astonishment was not abated by the information that these iconoclasts had been perpetrated neither by fanatic Hindoos on the one hand, nor by Mussulmans on the other, but by a Goth of the latest advanced type, acting under Imperial sanction.

All Mr. Laurie's metaphors seem to keep in the Byzantine line. His first figure about the iconoclasts calls up visions of Leo the Isaurian and Constantine Copronymos, and between them and the persons complained of there is that degree of likeness which is found among all people who destroy anything. But when we come to the "Goth of the latest advanced type, acting under Imperial

sanction," we are puzzled indeed. What is a Goth? what is Imperial sanction? what is a Goth of the latest advanced type? how is one Goth more advanced than another? We have heard of people who were "Hibernis ipsis Hiberniores"; were there others who were "Gothis ipsis Gothiores"? The "Goth acting under Imperial sanction" sounds odd to one who has chiefly been dealing with Goths as opponents of the Imperial armies. Yet it is not to be denied that among the endless varieties of peoples, nations, and languages in the camps of Belisarius and Narses, one or two officers of some mark might have been found who really did answer to the description of Goths acting under Imperial sanction. But whether they were Goths of the latest advanced type, or what should have led Mr. Laurie so far out of his way in search of a metaphor, is wholly beyond our power of guessing.

The simple truth of course is that Mr. Laurie did not mean anything in particular, and was not thinking about Goths or anything else, but merely wanted to tell a story which would have been quite to the purpose if he had only chosen to tell it in a simple way. "Iconoclasm" and "Imperial sanction" are of course simply tall talk, a grand roundabout way of saying what might have been said straightforwardly. But the dragging in of the Goths is worth noticing. It shows that one of the most absurd errors, or rather superstitions, that ever grew up is still in force. Not many days before Mr. Laurie wrote, somebody calling himself "A Holiday Correspondent" wrote to describe the people of the neighbouring country going into Baden-Baden or some other of the German watering-places. He could not help calling it the "entry of the Goths into Rome." This of course was mere nonsense, and had no meaning at all, except to show that the "Holiday Correspondent" had heard of Rome and of Goths. Still even this shows the vulgar notion of Goths being a kind of people about whom it is safe to say anything. Mr. Laurie's talk goes a step further. If he thinks at all, he thinks that Goths were a kind of people who were in the habit of destroying ancient buildings, statues, and the like. We believe that there really are people who seriously believe this. The simple fact is that the Romans themselves destroyed the monuments of their own city, and, when they began to be ashamed of so doing, they laid the blame on the innocent Goths. How deep a hold this monstrous invention took on the popular mind in Italy is shown by a good many curious stories which will be found in the latter part of Gregorovius's *Geschichte der Stadt Rom*. In sober history it would be hard to find that any Goth ever wilfully defaced anything from one end of Italy to the other. Alaric destroyed nothing, whatever his troops may have taken away in the way of plunder. Theodoric strove to keep the Romans from destroying their own monuments. If Totilas, for military reasons, broke down part of the walls of Rome, he is hardly to be blamed for that; and the soldiers of Witiges are hardly to be called destroyers, because the soldiers of Belisarius threw down the statues from the tomb of Hadrian on their heads.

Every one will easily be able to call up instances of this common, but not the less strange, fashion of using the word Goth, sometimes as equivalent to destroyer, sometimes as a vague term of contempt, without any particular meaning. There are one or two odd cases in Boswell's *Life of Johnson*, and the *Spectator* is full of them. Still we can pardon Addison for describing Sir Roger among the tombs at Westminster as looking "like the figure of a Gothic king." Yet, if the figure of Sir Roger had been more like the figure of Ataulf, the widow might perhaps have been more ready to play the part of Placidia.

After all, the most curious application of the Gothic name is the architectural one. People who know nothing about architecture, and nothing about Goths, call mediæval architecture Gothic in sheer contempt. Then, just as great parties themselves took up the contemptuous nicknames of Whig and Tory, votaries of mediæval architecture took up the name and defended it, not as having anything to do with the national Goths, but in the general sense of Teutonic or mediæval. Gothic architecture, in short, was something like Mrs. Radcliffe's "Gothic stories." And the name, inaccurate as it is, is certainly convenient to oppose to Romanesque. But it is to be remembered that some people seem seriously to have thought that Gothic architecture was invented by the Goths. There is an edition of the *Encyclopædia Britannica* which says that "Gothic architecture was a manner of building introduced by the Goths, when they had altogether overrun the Roman Empire," and added that, "the Goths being totally destitute of genius, neither architecture nor any other art could be improved by them." And we have seen this strange passage copied in a book published within the last thirty years. But it is at Ravenna that we most feel the lack of some other nomenclature. The one spot in the world where there is Gothic architecture in the historical sense is just the spot where there is none of the least moment in the conventional sense.

It may be that in the next session of Parliament Sir John Lubbock, walking in the steps of Theodoric, will again give us an Ancient Monuments Bill. If so, we shall gladly hail him as a Goth of the latest advanced type, and shall wish him all success against Mr. Bentinck and all such Roman and Popish-minded persons as rejoice in the right of destruction. Their models are the Barberini; we prefer the Barbari.

THE FURNESS DISTRICT.

NORTH-WEST Lancashire has no historical title to celebrity. No event of even third-rate importance in English history had this part of the country for its scene. We must be understood to be speaking now, not of what is known to the House of Commons as North-West Lancashire, but of the part roughly bounded by Westmoreland, Cumberland, and the sea, or Morecambe Bay, its offset. This reminds us that the sea in this particular region has encroached much and is fast encroaching further. It is, in short, eating up the land, and has, within recent memory, eaten out a large hole in it. So that there is a "missing link" of the county, owing to a portion having been swept away; and the traveller in passing from one part of Lancashire to another at high water must pass either across the sea or through Westmoreland. The names of "New Grange" and "Old Grange" betoken places which at no distant date were doubtless the sites of farmhouses, but which now lie far out in the bay, probably from two to four miles from the shore-line, as laid down in the map, on the Lancaster side. On the further side the church and rectory of Aldingham stand now on the sea edge, although persons of no more than middle age remember a homestead with cottages, fields, and a road now wholly swept away, and whose site is covered by the sands or swept by the waves. The Crown is proprietor of a considerable tract of land in these parts, which must have been largely wasted, and is still wasting, by the advances of the sea. The case seems a critical one, as the low cliff is mostly of soft earth with no power of resistance; and some such defence as may be observed at Ramsgate and other places on the East and South coasts seems called for, where the soft chalk is strengthened below by a face of solid masonry to keep the waves from undermining it. The name "Burdsea," the next parish to Aldingham on the north-east, favours the same notion, having doubtless been *Bard's Lye*, and pointing thus to some island which would seem to have been wholly obliterated by the inroads of the tide. There is a project of a loop railway to ease the pressure of the iron traffic on the Furness line, to be thrown round the coast of the little peninsula of Furness, on the edge of which the two last-named places stand, and to run on the flat of the beach somewhere below high-water mark. This, if solidly built, may possibly act as a breakwater no less than as a means of locomotion; but we believe the first pile has not yet been driven, nor the first spade-full of sand yet turned, with a view to this work.

The peninsula of Furness has a fertility and productiveness in agriculture and in metals far above the average of England, and a race of inhabitants remarkable even in Lancashire, *felicis provincie* as she is. The Norman Benedictines from Savigny, who in King Stephen's time crossed five-sixths of England before they fixed on the sequestered valley in Furness known characteristically as the "Vale of the Deadly Nightshade," from the abundance of that plant in those parts, found the result of their wanderings quite worth the labours of the way. They must have met an almost unadulterated Norse population. We find *-by* and *-thwaite* and *-beck* in the local nomenclature, while the Norse connexion of the Isle of Man lying only a few hours' run from Barrow, is shown by its Bishops of "Sodor and Man" being dependent on the Archbishop of Trondhjem in Norway; "Sodor" being "Sudreyjar or Southern Islands"—i.e. the Hebrides from a Norse standpoint, according to the learned historian of "Words and Places." The aspect of the race of men who people these regions shows the somewhat harsh and hardy character of the Norseman, mellowed by a more genial, and diluted by a more watery, climate. In Barrow, the chief centre of the iron trade of the region, there has been a great admixture of men from many sources, especially Wales and Cornwall, as furnishing miners ready made, and from Ireland, a near and ready nursery of all hands for profitable labour. It is in the more purely agricultural villages that the physical type is, naturally, best preserved; nor is there, we believe, any equal area of rural England which could surpass or probably equal it. The commercial importance of this district dates from not above ten years ago. It is still possible that an immensely larger development may take place. The discovery of hematite iron ore may be said to have laid the foundations of the fortune of the region in question; the discovery of a workable coal-mine in the same vicinity would crown that good fortune. Earnest attempts to discover coal at Rampside, an outlying seaside hamlet of Barrow, have been kept up by some ardent fortune-hunters for some years past, but without any pronounced success. They seem disposed still to persevere, in spite of over seventeen hundred feet having been bored through fruitlessly. The borer is a hollow jointed steel tube, and is armed at the boring extremity with an "iron crow," set with "black diamonds," by the abrasion caused by which as it revolves three or four hundred times in a minute, more or less, a hundred feet of sandstone at a depth of over eleven hundred feet from the surface was pierced in a week. Borings either by this or some other less highly scientific agency, sometimes for coal, but more frequently for iron ore, are common all over the Furness country. The traveller by the least frequented roads will find one of these "hods," as the upperwork of the shaft is called by the country people, cropping out in the half-cleared thickets of some coppice, or by a solitary hill-side tarn, or amidst the rich verdure of some meadow bottom, unbroken perhaps before since its first vegetable crust was formed upon it. He finds air and earth throbbing with an uneasy hum as he approaches the machine; when nearer he finds this broken by the clatter as of wheel and ratchet, accompanied by a tearing noise as of a plane. The effect

on a horse's nerves of an iron monster planted hard by the road, spitting out fire and smoke at a level a little above his eyes, with the further aggravation of the noise aforesaid, is more severe than that of a locomotive approached at a level crossing, and the best broken horses, accustomed to the proximity of railways, have been known to refuse to pass the road thus beset, and to fairly turn tail and bolt. The richer hematite veins are commonly found in the mountain limestone, the outcrop of which encircles the older slates and "Silurians" of the Cambrian group. The tourist recognizes the peculiar industry of this region most notably in the groups of miners, red all over to the very whites of their eyes, whom he encounters along the roads. The coast villages pursue a somewhat precarious pursuit of fishing and "cockling," for which Barrow and Liverpool, with their large populations within easy distance by rail, afford suitable markets, while the rich soil of the neighbourhood makes the homesteads teem with all the produce of agricultural labour. As the stepping-stone to the lake and mountain region from Windermere to Keswick, this part of the county, by a slight *détour* westward, lies within easy reach of visitors, and seldom are so many objects of interest on the side both of the picturesque and of the useful found within so narrow a radius.

The usual reflections awakened by a ruined abbey are heightened when it stands amidst the throng of busy industry which in modern day has assembled on the very same scene. Mines, borings, and blast-furnaces spit their jets of flame and steam and smoke within half-an-hour's walk on probably all sides of what was once the Abbey of St. Mary in Furness, and on some sides within much less. The railway cuts clean through the still beautiful valley "cleop" "of Deadly Nightshade," sprigs of which plant, by the way, appear on the seal formerly borne by the abbots as part of their usual cognizance. The station is situated almost within the ruins, and the hotel adjacent has a mass of antique buildings, being part of the monastic remains, lying between it and its stables. This makes the chances strongly against the possibility of a solitary visit, except perhaps at midwinter. At Furness a visit to the Abbey may often be paid without finding another person save the guide to break the silence; but at Furness the inevitable fellow-creature may probably take the form of a miner out on "spree," unless the contempt for any object which one can see without paying should make the Abbey seem unworthy of such an important person's notice.

It may not improbably come to pass that the valley and hills round about it may be honeycombed by mining agency, and that a population may gather along the line of railway, and especially about the station of Furness Abbey, which may demand church accommodation on a scale at present unknown in the parts. The question will then occur, Why not rebuild the abbey church for parochial worship? It would be the noblest and fittest shrine for the devotions of the neighbourhood which its wealth and beneficent piety once nurtured, and amidst which it has now stood desolate for nearly three centuries and a half. The plan is of course noble and spacious—when was a Cistercian church not so?—but simple and practical. It is just a cruciform church with a large chancel arch. There appear to have been two pulpits, one for the transept and choir looking south-eastward, the other for the nave, less precisely determinable. The sedilia, with beautifully rich thernacle work in the decorated style, are nearly perfect still. The tombs of ancient abbots with richly floriated crosses, and one of a mutilated crusading knight, are still entire along the broken floor of the chancel, the names of several being more or less distinctly legible to the educated eye. The vast width of the windows east and west would give a grand transparency and lightness to the restored church, while there would still remain enough of ruin in the other monastic buildings adjacent to envelop the whole in a venerable halo of antiquity. The few hundred thousand pounds of expense would probably not be felt by the noble owner, nor grudged, if there was a real demand for a useful and pious work. Dalton, about a mile away, is a rather quaint little town on the slope of a hill, on which stands the castle closely connected with the Furness monastery. There is, by the way, another castle more purely of the past, at Gleaston, a village in the Barrow neighbourhood. This of Dalton has mostly disappeared, and what is left is masked on one side by a rubbishy modern *façade*. A third castle stands well out at sea on Peel Island—lately insulated, no doubt, by the onward sweep of the waves.

Since the Norse keels hovered in the offing, perhaps in the tenth century, no invader has ever come this way. The Cumbrian mountains were a tolerable bulwark against forays of the Scots. The region is happy in having "no history." It seems to have been just skipped by all the affairs of moment in all ages. The landing of Mary Stuart and the southward march of Charles Edward came nearest to it, but yet missed it. It has slept in the silence of all the centuries. It now forms one of the busiest and most interesting parts of England.

ULTRAMONTANISM AND SCIENCE.

THE *Times* has been enlivening its readers at this dull season with a controversy about the teaching of science at the Roman Catholic University of Kensington. "Cantab," "M.A.," and other Protestant writers have been essaying to prove from history that science cannot be freely taught under Roman Catholic auspices, and the Professors of the new institution have been doing

their best to answer them. Whether we are to infer from an angry insinuation in last week's *Tablet*, to the effect that some Catholics "whisper unworthy things" of Mgr. Capel's nascent academy, that there is some division among Catholics themselves on the matter, it is not for us to say. The relation of science to Catholicism, or rather to the Papacy—for it is on Papal infallibility that the whole controversy really hinges—is however a question of some interest. And, without committing ourselves to the side of either party in the recent correspondence, we purpose to say a few words upon it. In the first place, then, we may frankly admit that some of these assailants of "Roman Catholic liberty of judgment" have shown more zeal than discretion or knowledge in their method of attack. The alleged case of Virgilius and his view of the antipodes, for instance, is for several reasons nothing whatever to the point. It is far from clear exactly what Virgilius taught, and Neander thinks that the Pope's provisional censure, based entirely on a hostile report sent by Boniface, arose from the notion that his teaching involved a denial of the whole human race being sprung from Adam, and consequently included in the guilt of original sin. At all events, after summoning the accused to Rome for further examination, Pope Zachary saw no reason to alter his opinion, for Virgilius, instead of being condemned—and, as one correspondent of the *Times* asserted, burnt—became Bishop of Salzburg and a canonized Saint. Then, again, Mr. Wilkinson of Lutterworth thinks he has made a great point by quoting and—unfortunately for himself—translating a sentence from the Latin preface to the Jesuit edition of Newton's *Principia*, published in 1742, in order to prove that the editors promised to "yield assent to" the decrees condemning Galileo, while teaching the heliocentric theory as philosophically true. But the word which Mr. Wilkinson renders "to yield assent" happens to be *obsequi*, which simply means to *obey*. What the Jesuit editors promised was, not an *ex animo* assent to the doctrine of the Papal decree—which they of course knew perfectly well to be false—but the sort of external deference implied in not publicly contradicting it, which became famous in the Jansenist controversy by the name of "obsequious silence," and which had then, more than a century after Galileo's condemnation, come to be held sufficient at Rome. These however are minor issues. The brunt of the difficulty turns, and is felt by Ultramontane apologists to turn, on the fact of Galileo's condemnation for heresy by the Holy See. Before 1870 the difficulty in its present shape did not exist. A Roman Catholic might then have urged plausibly enough that he repented the decision, but that after all it only embodied the universal religious sentiment of the day, whether among Catholics or Protestants, who equally regarded the Copernican theory as contradictory to Scripture, and therefore heretical, and that the worst to be said of the Pope who condemned it was that he was not before his age. But this answer is no longer available for those who accept the Vatican definition of Papal infallibility. They are bound to show either that the Pope never really decided the question at all, or that he decided it rightly. One eccentric writer has actually maintained both alternatives together, but we may confine ourselves here to the usual Ultramontane plea, which is adopted by Mr. Clarke, the newly-appointed Professor of Natural Theology at Kensington. The censure pronounced on Galileo, he says, was not the act of the Pontiff himself, but of two Roman Congregations, whose decisions, though running in the Pope's name, possessed no supreme and final validity. He adds that to prove a contradiction between Catholic faith and science it must be shown that some scientific truth has been condemned—(1) not because of manner or extrinsic circumstances, but on the ground that it is contrary to some doctrine of the Catholic religion; and (2) not by any subordinate tribunal, but by the supreme and final tribunal of the Catholic Church. It is easy to show that on Ultramontane principles the condemnation of Galileo fulfils both conditions.

To enter on a detailed history of the affair would require more space than we can command here. But we may refer our readers to a learned and able pamphlet on *The Pontifical Decrees against the Motion of the Earth, Considered in their Bearing on the Theory of Advanced Ultramontaniam*, by a "Priest of the Province of Westminster." It was published before the close of the Vatican Council, when the "theory" against which it is directed was raised, according to the ordinary acceptance of the decrees, into a dogma of faith. However we are not concerned here with the personal incidents of the controversy, but with the facts. The explanation then as now proffered by Ultramontanes of the case of Galileo, which then as now was most commonly alleged against their pretensions, was that "the decision was not uttered by the Pope *ex cathedra*, but by Cardinals, for whom no one claims infallibility, and was a mere disciplinary enactment very necessary for its times." Now the original decree of the Index under date of March 5, 1616, states that "it has come to the knowledge of the Holy Congregation that that false Pythagorean doctrine, altogether opposed to the divine Scripture, on the mobility of the earth and the immobility of the sun, which Copernicus, &c. . . is being promulgated and accepted by many;" and accordingly, "lest an opinion of this kind insinuate itself further to the destruction of Catholic truth," condemns the books which teach it. It is allowed by Ultramontanes that this would be an *ex cathedra* decree if it contained certain words indicating that the Pope had ordered its promulgation; the simple answer is that the insertion of this particular formula is quite a modern custom, and that to argue anything from its omission in a decree of 1616 is an ignorant or dis-

honest anachronism. It is further urged that the divine gift of infallibility attaches to the person of the Pope and cannot be delegated to others; it cannot therefore be exercised by a Congregation of Cardinals; and, in the absence of any direct proof, we are not justified in assuming their judgment to be his. But in this case there is abundant proof. The condemnation of Copernicanism was, and was known to be, a Papal judgment. "Paul VI." as the editor of the *Dublin Review* admits, "and abettedly united with the Congregation of the Index in solemnly declaring that Copernicanism is contrary to Scripture." Moreover the Bull of Sixtus V. constituting these Congregations of Cardinals expressly directed that more weighty matters, *graviora*, should be referred to the Pope himself for his judgment; and the condemnation of Copernicanism, which has been taught publicly for many years under the highest ecclesiastical patronage, was confidently treated as one of these *graviora*. And, as though to remove all shadow of doubt, on Galileo's publication of the *Dialogo* some twenty years later, Urban VIII. caused it to be publicly notified that "by order of the Lord Pope and Lord Cardinals of the Supreme and Universal Inquisition," it had been already declared that his doctrine "that the sun is in the centre of the universe and immovable from its place is absurd, philosophically false, and formally heretical, because it is expressly contrary to Holy Scripture"; and furthermore that his books had been put on the Index "that so pernicious a doctrine might be altogether taken away (*procius tolleretur*) and spread no further to the heavy detriment of Catholic truth." This original judgment of the Index was announced to Galileo in a Congregation held in the Pope's presence, as he was expressly and officially reminded when, by afterwards continuing to teach the condemned opinion, he had incurred "vehement suspicion of heresy"; nor was he absolved till he had then again solemnly before the Congregation, "with a pure heart and both unfeigned, abjured, cursed, and detested the above-named errors and heresies, and every other error and heresy contrary to the Catholic and Apostolic Roman Church." Such are the terms and circumstances of the sentence pronounced on Galileo's teaching by a Congregation established to quote the Bull of Sixtus V.—"iniquum firmissimum Catholicæ fidei propugnaculum . . . in obsequium rei gravitatem Pontifex Romanus præsidere solet." If such a decision is not an *ex cathedra* judgment of the Pope, what is it? To deny it, in the words of the learned author already referred to, involves three absurdities—(1) that the Pope uniting with a Congregation to make a law for the time—[The Church does not *ipso facto* act in his official capacity as Supreme Head of the Church;] (2) that such language in a Papal Bull as "*et nobis retulerint, nostra auctoritate rejiciant*," or "*rationes gravemque ad nos vel successores nostros deferantur, ut quod secundum Deum expediret, ejus gratia adjuvante mature statuamus*," may refer to the Pope in his private capacity only; (3) that when a Pontifical Congregation, acting under the Pope's orders, testifies that an opinion *since its condemnation* by the Pope is to be regarded as a *heresy*, to be abjured with all other errors and heresies against the Holy Catholic and Apostolic Roman Church, it yet does not attest that the Holy See has condemned that opinion.

Let it be further remembered that Urban VIII.—who certainly took up the matter on public grounds, and not, as has been most unjustly contended, out of personal spite—exactd from Galileo an unreserved *ex animo* assent to the doctrine of the previous decree of the Inquisition against him in 1616. And the *Dublin Review* maintains, reasonably enough, that "the Pope never exacts absolute and unreserved assent to any doctrine from individual Catholics, except where he exacts such assent from the whole body of Christians; otherwise he would himself destroy that unity of faith which it is his office to maintain." It was therefore obligatory on all Catholics to reject the heresy of Galileo. Moreover, in 1664 Alexander VII. in the Bull *Speculatores Domus Israel* solemnly ratified the decree of the Index of 1616. We may add *ex abundanti* that, according to a brief addressed by Pius IX. in 1864 to the Archbishop of Munich, usually regarded by Ultramontanes as an *ex cathedra* judgment, "men cannot have that perfect adhesion to revealed truth which is necessary for the progress of science and the refuting of error, unless . . . they subject themselves in conscience to the decisions concerning doctrine put forth by the Pontifical Congregations." Mr. Clarke gives no authority for his assertion, borrowed perhaps from Venturi, that Benedict XIV. suspended the decree against Galileo. What is certain is that the works condemned in that decree are included in an Index published by Benedict XIV., to which was attached a Constitution expressly approving, confirming, and enjoining its observance on all persons everywhere by apostolical authority.

In his last letter to the *Times* Mr. Clarke cites a passage from Dr. Whewell's *History of Scientific Ideas*—for which, by the way, he gives a wrong reference—to the effect that Cardinal Bellarmine, at the time of the decree against Galileo, whose abjuration he received, spoke of its being rescinded if a demonstration of the heliocentric theory should be discovered. If the quotation of Bellarmine's words is accurate—and Whewell's account of the Galileo affair in his *History of the Inductive Sciences* is in many particulars inaccurate—it need not mean any more than that he was sure no such demonstration would ever be discovered. Be that as it may, Bellarmine's opinion, whatever it was, was simply that of an individual Cardinal, and, if Whewell rightly interprets it, was conclusively overruled by the subsequent acts of Urban VIII. and Alexander VII., which attest the strictly dogmatic character of the condem-

nation of Galileo's "heresy." As to contemporary estimates of the force of this decree let two witnesses suffice—one an opponent, the other a devoted admirer of Galileo. The Jesuit Cazzareus, writing to Gassendi, says, "Vides . . . quam non immerito jam inde a Copernici tempore *Ecclésiæ* semper huic so errori opposuerit, et quæ etiam novissime non Cardinales aliqui, ut ais, sed *Supremum Ecclesiæ Caput Pontificis* decreto in Galileo damnaverit, et ut ne in posterum verbum aut scripto doceretur, sanctissimo prohibuerit." On the other hand, Viviani, an enthusiastic disciple of Galileo, felt it necessary in writing his master's life to speak of the Copernican theory as "*genuè damnata da Sancta Chiesa* come repugnante alla divina Scriptura." On the whole, the learned Roman Catholic writer to whom we are largely indebted for this sketch of Galileo's case does not at all overshoot the mark when he draws from it these inferences:—(1) Rome—i.e. a Pontifical Congregation informed by the Pope—may put forth a decision scientifically false and doctrinally erroneous; (2) an opinion which the Pope has publicly required a Catholic to abjure as untenable and false may be perfectly sound; (3) the Pope may require a Catholic to assent *ex animo* to a judgment doctrinally erroneous; (4) he may further command a Pontifical Congregation to promulgate, as a part of the teaching of the Holy Catholic and Apostolic Roman Church, what is scientifically false and doctrinally erroneous; (5) he may officially "confirm his brethren" the Cardinals in an error on the matter of faith, and use his authority as Pope to indoctrinate the Church therewith; (6) it is not always good for Catholics to think as Rome does, even on points of doctrine.

Before concluding it may be right to mention that a loophole—*velut quædam*—for those who desire to reconcile the Vatican decrees with the facts of history has been provided in one of Dr. Newman's latest publications. The endless disputes of the doctors on the meaning of the talismanic formula *ex cathedra* are not at all new. In the third volume of his *Historical Sketches*, in a note to the very interesting Essay on Theodoret, now published for the first time, Dr. Newman suggests an explanation of the words apparently framed with a view of restricting former inflexible decisions to the single case of the Immaculate Conception, it indeed even that decree will satisfy his second criterion. "Surely," he observes—"the italics are our own"—"for an *ex cathedra* decision of the Pope is required his formal initiation of it, *his authorship of its wording*, and his utterance amid his court, *with solemnities parallel to those of an Ecumenical Council*." There is certainly only one Papal decision that will satisfy the third condition, and we are inclined to doubt whether any can be found, strictly speaking, to satisfy the second; the Bull *Ineffabile* was generally supposed to be the composition of Passaglia. No doubt this interpretation of *ex cathedra* would go far to relieve the Kensington Professors, and perhaps many more besides of their embarrassments. But we must confess to some misgiving as to how many even of the minority Bishops who have since succumbed would be prepared openly to adopt it, and still more as to how it would be received at Rome. How far it agrees with the theory of the *Dublin Review* that the Pope "never ceases" to speak infallibly, or with Father Gallywey's desire for that happy time when a new dogma—like the daily provision of manna in the wilderness—will be bestowed on us every morning, we need not ask.

HOMBURG AND BADEN.

WHEN the reign of roulette and rouge-et-noir came to a close in the German watering-places, many people besides the inhabitants of those places were interested in speculating on their future. Each separate Bath had its own circle of patrons, in addition to the holiday tourists who went fluttering about from one to another capriciously distributing their favours. How some of these Baths could find constant visitors at all to return to them year after year, was a standing mystery to the admirers of others. The only plausible explanation was that there were genuine believers in the virtues of particular springs, who had the resolution to back a favourite fountain to pull them through against their infirmities, although seriously handicapped in the course of the cure by a depressing atmosphere and dull surroundings. There was Ems, for example, buried in the depths of its valley, with overhanging hills radiating perpetual heat upon stagnant air that could never be stirred except when it was swept out by a hurricane. Yet, in spite of the lack of shade and freshness and of any agreeable variety in its surroundings, Ems was habitually patronized by the German Emperor-King and his nephew the Czar of All the Russias, and of course, when personages so exalted set a fashion, hotelkeepers seldom have reason to grumble. Even when the gaming came to an end, Ems could still count on a fair share of popularity so long as her waters prolonged the lives of the potent monarchs who annually visited them. But there were other watering-places more fortunate in the advantages bestowed upon them by nature, and consequently more independent even of the most distinguished patronage. There was Wiesbaden, which lay so conveniently for the Rhine that few of the pilgrims of the great river failed to turn aside and drop in there in passing. The golden dome of its Greek church glancing in the sunlight on the pine-covered heights served as a sort of advertisement to the tables that were spread as traps under its shadow. When once you got there, it was an open question whether you would like the place or take an intense aversion to it.

The society was scarcely all that could be desired by the fastidious or aspiring, especially after Nassau had ceased to be an independent principality, and the ex-sovereign no longer mingled with his guests or drove over from his palace at Bieberich to dine with his tenants in the Kursaal. The scenery was questionable in quality, and might be defined even by its admirers as tamely picturesque. The carriage roads were decidedly dusty, and the woodland bridle-paths lay deep in sand; while the place itself was too much of a city, and there, as at Ems, there was something to object to in the temperature. If invalids and valetudinarians were attracted by the soothing vapours of the hot springs and the warm water that flowed streaming down the streets, many outsiders hastened their departure from what must, as they fancied, be as relaxing as a Turkish bath.

Without, however, stopping to criticize all these watering-places in detail, we may say, with a pleasant holiday Correspondent of the *Times*, that there were two of them that might be pronounced *facile principes*. Homburg on the heights and Baden-Baden distanced all competitors. Both were famous as centres of play; though in that respect the former had been doing its best to take the wind out of the sails of its older rival. At Baden there were the usual heavy odds in favour of the tables. At Homburg, thanks to the enterprise of speculative *entrepreneurs*, who advertised an alarming sacrifice in order to bring grit to their mill, the rouge-et-noir was played with the *demi-refait*, and the roulette with a single zero. Consequently, if a gentleman was starting from home on a gambling trip to invest the savings of his year's income, or if a daring and inventive spirit had devised some infallible system to break the banks and lay the foundation of a fortune, it was only natural that he should bend his steps towards Homburg. And, considering that the gamblers were the most generous patrons of both places: that it was their gold that fed the fountains which played in fertilizing showers on the Kursaal and its pleasure grounds, fruitful of balls and operas, plays and concerts; that they hired the handsomest suites of apartments, ordered reckless diners of the restaurateurs, and never looked at the items of the bills; that, whether on the brink of ruin or flush of funds, they equally paid fancy prices for useless nicknacks in the shops and stalls—considering all this, we should have imagined that Homburg would have altogether eclipsed its rival in the good old days of the tables. As a matter of fact, however, it was not only passing strangers, tempted to try their luck and provoked by losses into persevering, who were found to drop their money at Baden. Professional gamblers parted with large sums there, though they had only to take tickets for the short journey to Homburg in order to fight the bank on far more favourable terms. It may have been partly that, in the gambler's proverbial frenzy, they ran their heads against stone walls in sheer love of the excitement and contemptuous disregard of calculations; it may have been in some degree that, in a spirit of gambling chivalry, they took a Quixotic pleasure in coping with exceptionally formidable odds. Still, however much these sophistries and illusions might serve to stifle the remonstrances of common sense, the true explanation of the fact that play was always brisk at Baden notwithstanding the superior inducements of Homburg is simply that many people infinitely preferred Baden to any other sojourn in the season. One would have supposed therefore that, when the gaming was brought to an end, Baden, which had always held its own with Homburg, would have been left in decidedly the better plight of the two. Its former frequenters would cling to it still, while it would win over many who had been lured to Homburg by sordid pecuniary considerations. The *Times* Correspondent assures us that this is not the case. His letters from Baden echo lamentations which he had to listen to everywhere. The glory of the place had gone with the guests. The great hotels were well nigh empty. The shopkeepers might monopolize any pleasures that were going, if they had spirit to enjoy them, for there was little business to keep them in their shops. The shady alleys before the Kursaal and around the kiosque were haunted by the sad spectres of the former glittering company; nay, even on the off mornings in the great week of the races there was scarcely a sign of animation to be witnessed on the road that leads to the course. The worthy citizens of Homburg, on the other hand, seem to be tolerably cheerful, and with considerable cause. If things are not as brisk as could be desired, at all events they are livelier than might have been expected. Invalids may empty their glasses at the springs of a morning surrounded by something like the merry crowd of happier times, and there are guests enough to encourage the municipality in persevering with a fairly well-filled programme of entertainments.

Yet, although Homburg appears to have the best of it for the present, we cannot believe that Baden will be nowhere in the end. Homburg suffered by the abolition of the tables only in common with other gaming resorts, and over many of them the qualities of her air and her waters gave her a decided superiority. She had been very much supported, if not actually made, by the better classes of English visitors; they were precisely the people who cared least for play, and most of them indeed positively objected to it and to the hordes of scamps of both sexes whom it attracted. Homburg besides is in the neighbourhood of the great city of Frankfort-on-the-Main—it is, in fact, a sort of suburb of it. Baden, on the contrary, is far from any town of importance, and has depended almost entirely on visitors from a distance. Visitors it had from all countries; there were many Russians, many Americans, and not a few English. But the nationality that predominated over every other, that set the fashions, and gave the

tone to its society, was the French. The French might be said to have annexed it, with the free consent of the inhabitants. During a couple of months, when the season was at its height, there was a steady incursion of invading columns by way of Strasburg, descending daily in battalions on the Oes platform. Most of the members of this Grand Army came with bellicose intentions towards the bank, and the flying corps of Amazons that it numbered in its ranks were the very fiercest of the combatants. A notoriety of the *demi-monde* was the last person in the world to care for the paltry difference between one zero and a pair of them, when she came attended by a train of admirers who vied with each other in keeping her supplied with ammunition. But, unhappily for both parties, when the war broke out, the town which had been socially French remained geographically German. Long before a puritanical Government tampered with the grand institution of the place, Baden was shivering in the cold shadow of the coming event, and experiencing a bitter foretaste of the calamity in store for it. The French were kept away, and no one turned up to replace them. For a whole season the only entertainment that was offered to the stray traveller was the sound of the distant guns when the Germans were bombarding Strasburg. Even after peace had been signed not many of the French came back. The least patriotic of them shrank from close daily contact with their German conquerors on German territory. This feeling survives still, and moreover the old frequenters of Baden are just those who least care to revisit it in its altered state. If they are inveterate gamblers, they go for the season to Monaco or Hendaye. If they used only to gamble because gambling fell in their way, they prefer to enjoy the gaieties of Trouville or Biarritz. There is always a charm in a crowded and chattering promenade by the sea, while the lonely beauties of hill and dale in the Black Forest have but small attractions for Frenchmen except for picknicking purposes. For other nations, however, who are capable of really loving nature for her own sake, these forest beauties must inevitably act as a magnet that will gradually draw them in increasing numbers. We say nothing against Homburg, which we fancy very much in many ways. We have been told that the waters there are good, as they certainly are exceedingly unpleasant. Nothing can be fresher than the morning breezes from the Tannus. There are agreeable enough distant excursions in the mountains, while in the pretty gardens that lie around the Kursaal art and wealth have conspired to do their utmost. But in point of natural beauty Homburg will not bear comparison with Baden for an instant. In opportunities for agreeable expeditions of all lengths, Baden indeed may rank after Ischl. The lazy lout-er with book or cigar may find an infinite variety of scenery within fifteen minutes' saunter from his hotel. You have the Black Forest stretching away towards Stuttgart, with endless subjects in its valleys for the brush and the pencil, with pleasant streams where no one will interfere with your fishing, with inns primitive but comfortable where you may pass a night, with excellent roads over which you may travel economically by *Luspanner*, to say nothing of an occasional railway. In short, Baden is a place which you fall in love with at first sight, and whose charms win on you as you grow more familiar with them. It is purified now of the obnoxious vice and dissipation which used to deter many steadygoing people from prolonging their stay there, and when once the world begins to realize this fact, we shall be surprised indeed if it does not settle down to a satisfactory future.

A SENSIBLE SERMON.

IT is a familiar complaint against clergymen that they are too much given to preaching, as the Scotch laird swore, "at large," and that they prefer to bemoan the sinfulness of the world in general rather than to expose the particular wickednesses of the people whom they are addressing. The explanation of this tendency has been given by an American poet, who remarks that there is no danger in going in very strongly against wrong in the abstract, for the simple reason that that kind of wrong is never committed, and therefore nobody feels aggrieved when it is denounced; but, he adds:—

—you must not be hard on pertikeler sins,
For then you get kicking the people's own shins.

The Bishop of Manchester, however, does not seem to be disposed to adhere to this prudent rule, and the other day he took to kicking the shins of some people rather vigorously. The occasion was a charity sermon in order to raise subscriptions for the repair of a church, which was built only thirteen years ago, but which, it seems, has had to be pretty nearly rebuilt in consequence of the foundations of the columns giving way. The Bishop seized the opportunity of speaking in very strong language of the conduct of people who "scamp" church buildings, and from church buildings he passed on very naturally to other buildings, and denounced in equally emphatic terms the system of erecting what, it appears, are technically known as "jerry" buildings. These he explained to mean buildings which are run up by speculative builders of the flimsiest materials, with the thinnest walls, at the least possible cost, and intended to last the least possible time. The Bishop said he had learned on good authority that buildings of this kind paid better than any others. It is to be feared that the construction of "jerry" buildings is not confined to Manchester, and that on examination too much of modern London would be found to be

of the same flimsy and fictitious texture. Nor is the concoction of commodities which might come under the general name of "jerry" by any means confined to builders and architects. We live in a world which is pervaded with "jerry." We meet it in all directions. We eat "jerry" and drink "jerry," and go about with it on our backs. It has got into our houses, our furniture, our ships. Our tea is iron filings and indigo, our wine vinegar or sulphuric acid, our silk cotton. There is, in fact, scarcely an article of commerce nowadays which is really honest and genuine, and what it purports to be. The very phrase "article of commerce" has acquired an ominous significance, and implies that the article, whatever it is, has in passing through the hands of commerce been transformed from its original character into something more or less fictitious. It is evident, therefore, that if the clergy are at all disposed to follow Bishop Fraser's example, and engage in a crusade against "jerry," there is plenty of scope for their efforts in this direction; and it will be instructive to watch the results. A few weeks ago a working-man picked up a bundle of banknotes in the street, and at once restored them to the bankers to whom they belonged. The bankers not only rewarded the finder very liberally, but made inquiry as to the church which he attended and gave it a handsome donation too. We have no information as to the sort of sermons which are preached in that church; but the bankers appear to have been content to judge by result, and to assume that, as a member of the congregation had given such a remarkable proof of his honesty, this must be due to the wholesome influence of the services which he attended. It would certainly be interesting if the test could be applied on a wider scale. We should then be able to form some idea of the practical value of the vast amount of sermonizing which is constantly going on. It is not everybody who has a chance of finding a bundle of notes lying before him in the street; but what may be called the ordinary honesty of mankind is perhaps subjected to a more wearing strain. There is no subject on which there is such an infinite variety of shades and refinements of opinion as on what constitutes actual dishonesty, and there is no subject on which people require more closely to watch themselves, and to be watched over by their spiritual mentors. What in the first instance would be condemned by every one as a fraud gets to be in a manner legalized, or at least whitewashed, by custom. This adulteration, which in the beginning is furtively practised with fear and trembling, is afterwards carried out confidently and systematically on a large scale, and is supposed to be sufficiently justified by the fact that it has become a common practice of the trade. It is recognized, even by popular and reforming statesmen like Mr. Bright, as a form of competition; and, as everybody does it, nobody is held to be specially to blame. It is probable that in the early days of the evil the builders of "jerry" houses may have had a guilty sense of wrongdoing; but this would pass away as buildings of this delusive character were gradually multiplied. A host of competitors would rise up to keep each other in countenance; a younger generation would implicitly accept "scamping" as a regular and proper method of business, and any objection to it would be met with the ready answer—"Custom of the trade." This is the insidious progress by which more common cheating is in course of time legitimized, and it surely falls within the range of evils upon which the pulpit might be expected to bring to bear such influence as it possesses. Unhappily it is usually mute on such matters, and prefers fine language about the abstract to plain language about the concrete.

It is certainly not desirable that clergymen should rashly thrust themselves into political or economical controversies in regard to which they cannot speak with any particular authority, and which, too often, their language shows that they do not understand. There are, however, many questions of practical morality upon which, if they look for practical results from their preaching, they might reasonably be supposed to have something to say; for, though it is true that such questions do not fill the whole sphere of religious teaching, they occupy at least an important part of it. The Bishop of Manchester could not shut his eyes to the fact that the reason why he was preaching an appeal for subscriptions on the occasion to which we have referred was that the building of the church in the first instance had been "scamped"; but there are many much worse things to which clergymen, as a rule, appear to be less sensitive. There is the subject of intemperance, for example. Many clergymen are in favour of coercive legislation, with a view to the suppression of this destructive vice; and it is curious that they fail to perceive that their demand for such a remedy is practically an admission of the weakness of their own resources. The natural inference would seem to be that the preaching power of the country is somehow either not applied as it should be, or is wanting in some element of force. It may be said, no doubt, that the classes who are most wasted by intemperance are just those whom it is most difficult to bring within the range of pulpit influence; but this again is only an acknowledgment in another form that pulpit influence is least effectual where it is most required. And in any case, this argument does not apply to other classes of the community, who are tolerably regular in their attendance at church, but whose personal morality scarcely corresponds with the religious doctrines to which they profess adherence. The Bishop of Manchester, for instance, might profitably follow up his discourse on "jerry" with some remarks on the manufacture of short-measure reels of cotton. There is also the notorious system of loading cotton cloth with chalk in order to increase its weight, and thus defraud purchasers who buy an article of which a considerable part vanishes as soon as

it is wetted. This is a thievish trick of the worst kind, and it is known to be practised by a large number of Lancashire manufacturers. There is no sort of reason for adding chalk to the extent to which it is used except to give a fictitious weight to the fabric, and it is deliberately and systematically added for this purpose, and for this purpose alone. We have "jerry" here as well as in church-building, and if sermons are intended for practical correction, they might naturally be expected to be directed against this and other equally flagrant acts of mercantile dishonesty, from the almost universal adulteration of the shopkeepers to the bubble Companies of more daring speculators. We should be sorry to say anything that could be construed into disrespect of the pulpit, but, like other public institutions, its utility must be tested, not by its pretensions, but by results.

The low tone of commercial morality is a subject which is usually avoided or ignored by preachers, and yet it is the most dangerous cancer of the age, and its baneful influences may be seen on every side. A sort of conventional code of morals has been invented according to which almost any transaction, no matter how fraudulent in intention and effect, is to be regarded as fair as long as it does not actually land a man at the Old Bailey, and, even if it does unfortunately lead to that awkward conclusion, is rather to be pitied as a misfortune than punished as a crime. It is obvious that nothing can be more dangerous and fatal than the atmosphere which is thus produced. It scatters its subtle and insidious poison in every direction, and corrupts and corrodes all who come within its influence. The simple rules of absolute honesty being surrendered, degrees of dishonesty are soon hopelessly confounded, and the sense of honour is blunted to everything save the sharp edges of the criminal law. A malady like this, so deeply seated and so noxious, might naturally claim the attention of spiritual physicians, but it does not appear that it receives it. The truth is that there are many social disorders which the law cannot touch, and which it is not desirable that it should strain itself to reach. These can be subdued only by the force of persuasion and the pressure of opinion. The reason why there is so much commercial laxity is simply because this sort of looseness has ceased to be regarded as disreputable; it is recognized as, at the worst, only a rather imprudent form of speculative adventure. The prevalence of scamping is due to the competitive spirit, released from the restraints of old-fashioned honesty, and encouraged by the countenance of brisk competitive rivalry. What is wanted to remedy this state of things is a more wholesome condition of public opinion on such matters, and to the formation of this opinion clergymen, if they had only the courage to speak out their minds, and the acuteness—not too generally diffused, it is to be feared, at the present moment—to discern how they can be most usefully employed, might powerfully contribute. A patient has little to hope from a physician who will not descend from broad general speculations on the laws of health to the close observation of the vulgar details of actual disease.

THE CHURCH OF ST. FRANCIS AT ASSISI.

SOME anxiety has not unnaturally been felt for the fate of the art treasures in the Franciscan convent and triple church at Assisi. The lands, amounting, it is said, to forty-two estates, have been confiscated and the monks dispersed; but what seems far worse, in the eyes of archaeologists and artists, is that restorers armed with the authority of the Government are hard at work in pulling away altars, knocking down walls, and renovating frescoes. The priests, as a matter of course, have been up in arms, and painters and many others whose cherished associations have been set at naught are still clamorous. But the first panic is now a little past, and a brief statement of facts which we have learnt on the spot may tend further to mitigate alarm.

On the dissolution of the Monastery of St. Francis provision was made for the due performance of the services in the church, and a few of the monks are retained and subsidized for that purpose. As a matter of general State policy they are not allowed to retain the picturesque garb of the order, but, dressed in black, they assume the office and the aspect of ordinary priests. We have recently witnessed in the Lower Church a function in honour of the Nativity of the Madonna, which, as to the music and the scenic display, was creditable to the clerical staff as now constituted. Moreover, the Government, in laudable zeal for the preservation of historic works, has taken the whole structure as a national monument under its protection, and a small annual grant is made for incidental expenses.

The reader may remember that the church of St. Francis at Assisi consists in fact of three churches placed over each other. The lowest is little more than a chapel or a vault, and its only interest lies in the tomb of the Saint. This church has not been touched in the recent renovations. Then follows the Middle Church, a massive, shadowy, and almost sepulchral structure of the thirteenth century; the vaulted roof is of round arches; the side chapels, later additions, are pointed in the vaults and in the windows; the walls are covered with frescoes by the precursors of Cimabue, by Cimabue himself, by Giotto, and others. The Upper Church, also of the thirteenth century, displays the Gothic style in its early simplicity and breadth, and while the Lower Church is sombre and sepulchral, the Upper rises with joy as a creature of the light into the sky. Both churches were alike covered with frescoes, works which have cruelly suffered, and are in parts irremedi-

ably lost. The two churches, when they had received in the fourteenth century the finishing touches of the chief masters of Florence, and Siena must have been the most lovely and mature manifestations of pictorial art applied to mural decoration then extant. But in the course of time not only did decay come, but, what was still worse, structures and paintings belonging to later and debased periods were ruthlessly thrust into the midst of the early and good work. The object of the changes now in progress may be said in general to be to reinstate as far as practicable the Lower and the Upper Churches in their original integrity.

This bold and, as some would say, rash enterprise has fortunately fallen into safe hands. Signor Cavalcaselle, the fellow-labourer with Mr. Crowe in the *New History of Painting in Italy*, was to be seen daily during our stay in Assisi mounting scaffolding raised in front of frescoes or descending to excavations made in search of some ancient, but disguised, structure. The responsibility of the work is shared by Professor Botti of Venice, and others. And so much interest is excited that a little company of architects, painters, and amateurs has during the past months been gathered in Assisi. The Slade Professor of Oxford has been making studies from the frescoes; a German artist in the service of the Arundel Society has done more—he improves on what he sees; his copies, with one exception, which is said to be in facsimile, are of the nature of restorations; they do not represent the pictures as they now are, but as they might possibly have been. In addition to these labourers, there are architects busy in the taking of measurements, and archaeologists studious of masonry and observant of other indications of dates and styles. The operations in progress favour these investigations; they may be likened to railway cuttings which disclose hidden strata, or to dissections which lay bare an underlying anatomy. This is the very time for some one to work out a careful monograph of the whole structure and its chequered history. Unfortunately but few written records have been preserved; the monks of St. Francis appear to be as illiterate as they are inartistic.

The restorations were found one fine morning to have made a sudden and startling jump. During the night, by the aid of twenty or more men, the obnoxious modern altars were swept away, much to the consternation of the priests who came as usual to say mass. By this bold stroke of business light was let in at darkened windows; frescoes by the dozen, especially a Madonna, Child, and Saints, by Cimabue, were made to look out once more from walls long masked; while, in place of roccoco carpentry and ginnerack ornaments, stood the simple stone altars before which the immediate followers of St. Francis had worshipped. But the clearances did not stop here. From the choir of the Lower Church was taken a wooden singing gallery whereby more frescoes were brought to light, and in like manner from the Upper Church stalls and seats in tarsia work, by no means bad in point of art, were swept away from the apse and the adjoining transepts. This wholesale measure we are inclined to think may have exceeded the bounds of discretion; the walls now present a bare and unfurnished aspect, and the pictures revealed, being mere wrecks, offer a poor compensation. Still it cannot be questioned that the east end of the Upper Church is thus brought back to its first estate, and moreover by the removal of these incumbrances it has become practicable to restore the high altar from the nave to its original site in the transept. It is difficult to realize, except on the spot, the collective result of these changes, but in general they may be said to attain the following ends—the clearance of a thousand and one trumpery appurtenances which offended common sense and pure taste, the reduction of altar ornamentation to the comparative simplicity of the thirteenth and fourteenth centuries, and the consequent restoration of the whole fabric to its first estate. There cannot be a doubt that much has been gained for archaeology, and scarcely less for art.

While we write, certain tentative operations are in progress. A pickaxe and a spade are brought to clear away earth from the columns of the portal of the Upper Church, in order to ascertain whether the original approach was on the level of the present grass-grown piazza, or by means of ascending steps from below. A few hours sufficed to prove that no remnants of steps exist. Another and more important investigation is directed to the reconciliation of hitherto unexplained anomalies arising from the scattered and almost purposeless distribution in the nave, chapels, and transept of the Lower and Upper Churches of marble slabs inlaid with mosaic. The conjecture is, not only that these ornate marbles may be made to fit together, but further that the collective structure constituted a choir, with ambones and screen similar to that typical form found in San Clemente at Rome. It is almost too much to expect that the measurements and excavations now in progress will fit so precisely as to establish this ingenious conjecture. But, at all events, such thorough and painstaking search shows that the present generation of Italian architects and archaeologists, unlike their presumptuous predecessors, do not seek to destroy, but are solicitous to reinstate. In this respect we observe in Italy a great change for the better.

The greatest difficulty has been to know what to do with the frescoes. They present different stages of decay, amounting in many places to absolute destruction; some have crumbled wholly from the walls, others are so far obliterated that the subjects can hardly be deciphered, while scarcely a single composition remains without the loss of a head, a hand, or an entire figure. Under the circumstances, what course is the wisest? Several alternatives presented themselves. Some persons would be found to urge that the works were too precious to be touched at all; but

to this position a sufficient answer is that, if not dealt with somehow, they must perish irretrievably; the misfortune, in fact, is that they were not taken in hand a century or more ago. Other experts would insist on the adoption of that system of restoration, or rather of partial or entire repainting, which, though worse than the worst decay, has been for long the universal punacea in Italy. To mention a tenth or a hundredth part of the works thus ruined would far exceed our limits. Some of the frescoes in the Upper Church have been thus killed by kindness. Again, other counsellors might presume to advise even the substitution of modern pictures in the place of the frescoes gone beyond power of recall; that in past centuries such a course was ventured on is evident in certain chapels of the Lower Church, where comparatively late frescoes now cover walls previously occupied by early paintings. We cannot but think that these various plans have been wisely set aside in favour of a measure which, stopping short of restoration or renovation, seeks simply to preserve whatever still remains.

The plan and process adopted and now in course of being carried to completion we will endeavour briefly to explain. We found on mounting the scaffolding which, in the Upper Church, reaches to the pictures which we hope may still be accredited to Cimabue, that workmen with chisels, hammers, trowels, and mortar were steadily operating under the immediate supervision of Signor Cavalcaselle and Professor Botti. Where a large piece of wall had fallen into rottenness, and was denuded of its picture, it was simply cut out and replaced by sound cement. Again, where only a small part of the intonaco was in decay, a chisel removed the crumbling mortar, and a trowel replaced the void by firm material which bound the surroundings together as by a wedge or a plug. The process, it may be observed is honest; the new and uncoloured mortar speaks for itself. Next, and chiefly, those parts have been operated upon, fortunately still very considerable, which, though in decay and threatened with destruction, are yet capable of preservation. The malady which afflicts these frescoes is one common to the whole genus of wall-paintings. The surface or pellicle of the picture is in blisters, the whole of the mortar is disintegrated and ready to fall down on the floor as dust, and the entire picture must speedily die if left to its disease. To fix these flying particles and fleeting paints some glutinous medium is infused, and then, with a gentle but firm surface pressure, the loosened atoms of the picture are once more brought and bound together. Furthermore, pains are taken to remove the dust of ages by means of a soft brush or simple water, and finally some fixing medium is washed over the surface and into the pores. The composition used is said to be a secret, but we presume it may be the silicate known in Germany and in England as "Wasserglas." The same medium will probably be applied to the external stonework of the church, not only to arrest, as in our Houses of Parliament, further decay, but to prevent the percolation of rain from the exterior walls to the interior frescoes. The result of these operations, though not all that might be desired, is on the whole satisfactory. Without the use of brush or the addition of colour, the frescoes are wonderfully "refreshed," and they are moreover placed *en permanence*.

The two churches, while they still serve for religious functions, may be said to be now converted into museums of art. And in no other spot, not even in the Campo Santo of Pisa, can the early masters of the Italian revival be better studied. Frescoes by Giunta carry the spectator back to the petrified forms of Byzantium; *chefs-d'œuvre* by the illustrious pupil of Giunta show how great an advance was made under Cimabue, a master nowhere else seen in equal maturity or grandeur. A third generation brings us down to Giotto; fortunately the compositions which here attest the painter's creative power, symmetric arrangement, systematized treatment, and comparatively perfected style, retain much of their original character. Thus we see the early school of Florence transplanted to Assisi, and in like manner the contemporary but rival masters of Siena find in the spiritual forms of Pietro Lorenzetti and of Simone Martini a conspicuous and honourable place on these truly historic walls. We feel grateful to Signor Cavalcaselle and his fellow-labourers for having rescued these precious remains from further mutilation and decay.

Little need be said of the now tenantless monastery attached to the Church of St. Francis; it was never rich in art, though, judging from the great refectory, which could entertain two hundred and fifty guests at a sitting, it was bounteous in hospitality. Among the novelties which the dissolution brought to light were the prisons for the incarceration of refractory monks. A visit may also be paid to a small and prettily planted cloister, where are stowed away cartloads of skulls and skeletons which for long years have cried aloud for decent burial. The monks have brought upon themselves their galling misfortunes; the preceding narrative will have shown that, from lack of culture and from want of vigilance, they proved themselves the unworthy keepers of priceless treasures, and they have written on the walls, in the most debased forms of art, the low estate into which they had fallen. The story which the Church of St. Francis recounts is melancholy; originally set upon a hill as a light which could not be hid, its brightness was turned into darkness; the vow of poverty became first a mockery and then grew into a dire reality, until at last the whole city of Assisi presents a spectacle of mendicancy to which there is no parallel, not even in Italy.

PARTY WAR IN NEW YORK.

THE local politics of New York continue to perplex and amuse outsiders. A furious war is going on between Mayor Havemayer and ex-Sheriff Kelly, whom we dimly perceive to be leaders of rival factions, and the most recent "development" of this conflict is the publication by the Mayor of a statement of prodigious length in which detailed charges of peculation and fraud, highly spiced with personalities, are urged against the ex-Sheriff. We will come to the statement presently, but it may be interesting in the first place to observe how the publication of this document has been received in the city to which the Mayor and ex-Sheriff belong. The *New York Herald* seems to be doing its best to find in the "Kelly-Havemayer war" a successor to the "Becher-Tilton Scandal," which is almost or quite played out. At our latest date from the other side the public had had Havemayer's statement before them for a week and were eagerly awaiting Kelly's answer to it. A reporter of the *Herald*, thinking probably that a light snack might be welcome to those who were expecting a full meal, called upon Kelly to collect, if possible, a few crumbs of information as to his answer. But Kelly had nothing particular to impart, so the reporter visited Mr. Waterbury, who appears to be an ally of Havemayer. This gentleman desired to deal with an allegation that, if Kelly as Sheriff committed fraud, it was the duty of him (Waterbury) as District Attorney to prosecute him. Mr. Waterbury answers that when he was in office he did not know of Kelly's frauds, and would have been astounded by the suggestion that he could be guilty of them; but he adds that his observations of Kelly's conduct and associates since have in a measure prepared him for the disclosure of these frauds. This, it appears, is a way they have in New York. The charges against Kelly are given in great detail of facts and figures, and must be proved or disproved by the books and other records of the Sheriff's office. This being so, Waterbury, who seems to be a lawyer, takes occasion to declare that he has no knowledge whether Kelly committed fraud, but he thinks him just the man to do it. The *Herald* repeats this remark as if it were of no particular importance, and probably it is not. In local politics it is apparently the correct thing to assert and pretend to believe that your opponents only want opportunity to pick pockets. Mr. Waterbury finished the interview by stating that he was going out of town, but should return on Monday "ready for all emergencies," and a "peculiar smile" flitted over the features of the "redoubtable Waterbury" as he made this promise. We do not, however, apprehend that any very tremendous incident would solemnize the return of Mr. Waterbury to New York. Everybody seems to have already called everybody else by all the abusive names that could be thought of, and happily the revolver and bowie-knife are not usually introduced into the party warfare of New York.

The reporter next calls upon Coroner Croker, who occupies a place subordinate to Kelly in Havemayer's statement, and who treats very lightly the charges brought against him. It appears that Havemayer had stated that Croker's friends and associates were "the rough and vicious portion of his district," to which Croker answers that his friends did not number among them any indicted and convicted criminals, "such as form the most intimate part of the Mayor's acquaintance." Thus we have an actual Coroner charged by an actual Mayor with associating with roughs, and retorting that the Mayor keeps company with convicts. The Coroner proceeds to say that all the charges brought by the Mayor against himself and Kelly are false, and they were merely brought as a "bold stroke for popularity" by the Mayor. We may infer from the actors in this drama what must be the audience. It appears to be accepted as a reasonable and credible theory that Havemayer, finding the influence of his party waning, thought to reinvigorate it by bringing against Kelly charges which, if not true, are stupendous falsehoods. The charges must await Kelly's answer, but while that is preparing, the *Herald* anticipates a few of the more striking points in it. It was of course Kelly's duty as Sheriff to hang such criminals as were sentenced to the gallows during his term of office, and one of Havemayer's points is that Kelly charged the State of New York inordinate and unconscionable sums for getting its criminals hanged. One item which is particularly challenged by Havemayer is a charge of forty dollars for shaving a murderer named Jeremiah O'Brien before execution. Kelly's explanation of this charge, as reported by the *Herald*, is that this sum of forty dollars was paid for shaving Mr. O'Brien during several weeks of incarceration, and that "other murderers" enjoyed the benefit of tonsorial art without extra charge. Even with this explanation we find in the admitted fact that forty dollars was charged for shaving murderers confirmation of the remark made some time ago that hanging criminals in New York had become such an expensive process that only a wealthy State could afford that luxury. It is admitted by Kelly's partisans that he charged much more for hanging than his predecessors, but as it is near six years since he held office, and the prices of all necessities of life, including the means of putting an end to it, have gone on increasing ever since, it is possible that Kelly's extravagance or exaction may after this lapse of time be regarded as thrift and honesty. It seems to be agreed that the Sheriff has always been entitled to a fee for hanging a criminal, although he was not expected to adjust the halter himself, and it seems also that this fee was raised during Kelly's term of office. It will occur to

English readers that, if this were done by Kelly, it must have been checked by somebody else, but that would be a purely English, and therefore erroneous, conception. The gist of Havemayer's charge, as we understand, is that Kelly and his confederates were all in office together, that one made out accounts, another audited, and a third paid them, and then the trio divided the spoil. Really, however, Havemayer's charge is a "bold stroke" for popularity and re-election, and there is probably no serious intention of trying the question whether Kelly as Sheriff did six years ago overcharge the State for hanging criminals.

The Mayor's letter occupies nearly nine columns of the *New York Herald* of September 18, and, as that journal says, "the language selected by his Honour is plain and unadorned, leaving in no instance any doubt as to his meaning." The editor seems to find much amusement in the fact that Mr. Havemayer is an old man; he calls him "our municipal fossil," and delights to suppose that he was a contemporary of Knickerbocker. If the charges were true, it would follow, as the editor suggests, that Kelly must be worse than Tweed. But unless their truth can be tried in a court of law, which appears unlikely, they will probably be believed only by partisans of Havemayer, while Kelly's faction will regard his forthcoming vindication as triumphant. As regards execution fees, the allegation is that the bill of Kelly's predecessor for hanging a man was 1987 dols., while in Kelly's first term he charged in two instances 12407 and 11378 dols. respectively, and in his second term, when Watson added his charges, they increased to 94080 dols. This was in the case of Jeremiah O'Brien, and it may have been in compliment to the distinguished Irish name which he bore that he was hanged regardless of expense. The items of charge for an execution in 1866 or 1867 were as follows:—

Bullying school	100 00
Shaving fee	20 00
Twenty band-pipers assisting	12 00
Two watchers	20 00
Summoning jury and witnesses	10 00
Ceremonies and carriages	25 00
Advertising same	9 75
Such expenses	125 13
	<hr/> \$94080

By way of comment Havemayer states that by prescription the Sheriff's fee for executing a convict was 56 or 25 dols. Nothing authorized Kelly to charge more, but he has charged 200 dols. in one case and 250 dols. each in other three. The pithy remark is added, "found in this item 850 dols." Other items of alleged fraudulent charge are "pretended report of imaginary convictions," "conveyance of alleged prisoners," "pretended summoning of mock constable," and of "imaginary jurors"; and the total of monies said to be fraudulently obtained is upwards of 80,000 dols. or 16,000*l*.

The specific allegations of this wonderful document are mixed up with general vituperation. Much stress is laid upon the fact that Kelly has been called "honest" and reported "pious." One of his smaller charges against the State is designated as a "little grab." He is said to have defrauded the Public Treasury, defamed the character of the city, labelled citizens of his own race, and sunk himself to the lowest depth of disgrace. We have sought in vain for further details of the alleged libels by Kelly upon citizens of his own, which is manifestly the Irish race, and we must content ourselves with remarking that the saying *calum non animam mutant* is eminently true of Irishmen in America. All the world over if one Irishman is to be roasted, there is another Irishman ready to turn the spit. The contemporary of Knickerbocker has evidently been assisted in composition by some master of Hibernian eloquence. The Irish adventurer who sought to recommend himself in London by stating that he had a remarkable talent for vituperation should have placed his abilities at the disposal of one of the parties in New York. It appears that Mr. Havemayer is still tormented with remorse at having on Kelly's recommendation appointed Richard Croker to the office of Marshal. He did not suppose from Kelly's remarks that Croker was a member of any church, but he did suppose that he was a young man whose merits had failed to receive full appreciation, and he expected to find in him a man of uprightness and peace; but he was mistaken. We have already quoted the emphatic language in which Mr. Croker has answered the Mayor's remarks on himself, and we need say nothing on behalf of a gentleman who is eminently capable of taking his own part. Another and more celebrated name is next introduced into the Mayor's indictment. "You and John Morrissey," he says to Kelly, "have been a power in this community, and your joint efforts have placed judges upon the bench and other men in office of more or less importance, all of whom you claim to own." This, or something like this, is, we believe, alleged by each of the contending parties against the other, and probably one party is as bad as the other and worse. The Irish element largely influences their language, and perhaps also their conduct. A distinction, which we think refined, is drawn between monies "fraudulently" and "wrongfully" obtained by Kelly, but as regards both alike it is alleged that his accomplices, being by his and their contrivance appointed auditors, passed whatever charges he chose to make against the city. It seems, indeed, that his charges must have been to a certain extent colourable. If he had thought proper to charge 100,000 dollars for the purchase of a white elephant for the amusement of a

prisoner under sentence of death, it is possible that even Auditor Watson might have hesitated to pass the item. As regards this functionary, Mr. Havemayer writes that

The Honorable John McKeon, whose hostility to corruption is as well known as his vigour in denouncing it, has often stated that Watson came [from California to New York] in irons, but he may not have intended to be understood literally.

We are inclined to think that other vigorous denunciations of corruption besides those which emanate from the Honorable John McKeon may not have been intended to be understood literally. Immediately after the publication of Mr. Havemayer's impeachment the reporter of the *Herald* called upon the author of it and found him serenely confident in the smashing and pulverizing which he had inflicted on Mr. Kelly, who on his part appeared, when visited, to regard with quiet contempt the "senile twaddle" of the Mayor. Each party has a room full of books and papers, and we know that even in England figures may be made to prove anything on paper. There is probably no idea in anybody's mind of attempting to prove against Kelly in a court of justice alleged speculations which are at least six years old. These imputations of fraud and perjury are merely the ordinary weapons in New York of a party warfare which is conducted on the method of the rival editors of Eastonsville.

NEWMARKET FIRST OCTOBER MEETING.

THE first of the autumn meetings at headquarters was made notable by the reappearance, after an absence of more than three years, of the colours of the Count de Lagrange on the English turf. The well-known blue and red, so associated in the minds of racegoers with recollections of Gladiateur, Fille de l'Air, and other celebrities, had a fair share of success during the last two days of the First October Meeting; and throughout the week the French stable, of which Count de Lagrange and M. Lefèvre are now the chiefs, showed improved form. The very first race of the meeting ended in the unlooked-for victory of Novateur, who met Leolinus across the Flat at even weights, had the speed of him all the way, and beat him in a canter, albeit Fordham did not trouble his horse to win by more than a head. A reference to the *Calendar* will show how vastly inferior the public form of Novateur has been to that of Leolinus; and the French horse must have made wonderful improvement since August to have been able to lower the colours of the winner of the Prince of Wales's Stakes at Ascot, and the second in the St. Leger. It was, however, apparent at a glance that Leolinus had been indulged since Doncaster, and he is about the last horse to dispense with strong work. The course across the Flat is just suited to him, but he was in distress before half the distance had been traversed, and rolled about from want of condition. The easy victory of Novateur had the effect of making him a prominent favourite for the Cambridgeshire; yet a public trial with a horse palpably unfit to run is not a very trustworthy criterion of merit. The Hopeful Stakes produced a very interesting contest between Balfe, Camballo, and Ladylove, and the two former met to decide the battle which in the July meeting had been a drawn affair between them. In the July Stakes, Balfe, who at half a mile would have won the race in a canter, died away to nothing in the last quarter of a mile, and Camballo won cleverly. Two days afterwards, in the Chesterfield Stakes, over the short last half of the Bunbury mile, Balfe galloped right away from his horses, and Camballo, who was attempting to concede 7 lbs., could get nowhere near him. The obvious explanation of this contradictory running was that Balfe was a wonderfully speedy horse for half a mile, but could go no further; but his friends appeared to attribute his defeat over the longer course for the July Stakes to the fact of his having shied at something when coming down the hill. On the other hand, the supporters of Camballo protested that the defeat of their horse in the Chesterfield Stakes was solely due to his having got off badly, and felt no apprehension as to the result of the next meeting of the rival pair. The race for the Hopeful Stakes is run over the easy last half of the Abingdon mile, and Balfe, who was on this occasion receiving only 3 lbs. from Camballo, won just as easily as when he was in receipt of an additional 4 lbs. Ladylove was a good third, a neck behind Camballo; and it must now be acknowledged that, while a longer distance suits the Champagne Stakes winner, there are few horses who could compete successfully at half a mile with Prince Soltykoff's speedy son of Plaudit. Nor did the week pass by without additional confirmation being afforded of the inability of Balfe to compass three-quarters of a mile, even in moderate company.

The first of the four great autumn handicaps came next in order, and attracted a good field of nineteen runners. When this race was run over the T.Y.O. it was little more than a scurry, in which the start was everything, and the odds were altogether in favour of the lightly weighted horses. Now that it is run on the reverer Bretby Stakes course there is a much better chance for the topweights, and on this occasion the Great Eastern Handicap was as nearly as possible secured by that excellent mare Modena. Fifty yards more, and, despite her steady impost of 9 st. 3 lbs., she would have won easily. In addition to Modena, Trombone and Andred represented the heavy weights, and the field included the inevitable Oxford Mixture, Genuine, Puzzle, Athelney, and the French mare Aurora. The last-named has run very respectably on the Continent this

season, though her favourite distance seems to have been a mile and a quarter. She was sent over to Newmarket expressly to take part in the Great Eastern and October Handicaps, and since her arrival she had given satisfaction by her style of going at exercise. Possibly also she was indebted for some of her friends to the remembrance of the victory of her sire Plutus in this same race some years ago. The nineteen competitors got off with no difficulty to an excellent start, and it may be said that as they came down the Abingdon hill the race looked an absolute certainty for the French mare, who held a clear lead, and was going well within herself. Directly she touched the final ascent, however, she began to come back to her horses; and though the advantage she had secured earlier in the race was sufficient to ensure her the victory, she tired visibly at every stride, and only passed the judge's chair a neck in front of Puzzle and Modena, the latter of whom gained ground so rapidly in the last fifty yards that she must have won had the course been a little longer. The victory must be considered a lucky one for Aurora, for it is seldom that a horse going slower and slower at the end succeeds in winning. Trombone, we may add, would have been well up with the leaders, but was not ridden out for the barren honours of a place. For the rich Buckingham Stakes Craig Millar, Yorkshire Bride, and a son of Skrimisher and Vertunna came to the post. Craig Millar, on the strength of his close race with Camballo in the July Stakes, was made favourite, and justified the confidence placed in him by an easy win. Yorkshire Bride, as usual, ran gamely, but seems very deficient in pace. As a three-year-old, however, she may turn the tables on some of the more speedy performers of this season. The first day's racing was wound up by a good race over the Two Mile course from the Ditch in between Gang Forward and Chivalrous, and the ground, fortunately for the former, being good going, Mr. Crawford's fine-looking horse won cleverly by a neck, Chivalrous hanging on him very much toward the finish.

On the second day Leolinus again essayed to cross the Flat, and, having only Regal and the Vertunna filly to dispose of, he accomplished his task with ease. Yet so out of condition was he that after this mere exercise canter he lathered as profusely as if he had run the Beacon course at racing pace. For the Granby Stakes Balfe and Dreadnought—each penalized 7 lbs.—were opposed by La Sautouse, a dark French filly by Man-at-Arms; and again did Balfe display his inability to go a yard over half a mile. Throughout the latter part of his journey over the six furlongs of the Crit Son course he rolled about from side to side, and even had he beaten La Sautouse he would hardly have gained the stakes, for he would probably have been objected to on the ground of his interfering with her. We should have thought that this last exhibition of Balfe's non-staying qualities would have effectually extinguished his chance for the Middle Park Plate; but it appears that he is still not without friends for that great event. In the succeeding race, from the Ditch in, Trent disposed of The Pique and Boulet with consummate ease, so that any idea of getting a public trial for The Pique for the Cesarewitch was frustrated. On the other hand, Trent is such a game, honest horse that he can be relied on to tell the owner of Shannon what chance his mare has for the great handicap of next week. There was but an indifferent card for Thursday, though we were introduced to Coomessie, a half-sister to Chopette, who possesses all the speed of that celebrated filly, and is built on a much more substantial scale. She made mince-ment of her five opponents, among whom were Cashmere and Mary White, and won in regular old-fashioned style—by fifteen lengths, and all the others pulling up. An indifferent field came out for the Twenty-seventh Triennial over the T.Y.C., and after Régade's unsatisfactory exhibition in the Champagne Stakes at Doncaster, Garterly Bell was thought good enough to win. Running much straighter, however, than when she last appeared in public, the French filly accomplished a clever victory over Lord Ealmouth's horse. But the best race on Thursday was between Modena, Refinement, and Eve for the Moulton Stakes. Modena lay so far out of her ground that when she did come at last, it did not appear possible for her to catch the two light weights. As it was, she just got up in the last stride and won by a head, a like distance separating the other two. On Friday the great good-looking Horse Chestnut beat La Sautouse easily over the last half-mile of the Beacon course; and as Balfe in the July Meeting distanced the son of Lord Lyon and Golden Horn, no further proof can be needed that Balfe's defeat last week by La Sautouse was due to his inability to stay a yard over half-a-mile. Twelve run for the October Handicap, including Napolitain, Ecossais, Lady Patricia, Pique, Aurora, Genuine, and Wild Myrtle. Aurora had to carry 12 lbs. extra for winning the Great Eastern Handicap, and this penalty effectually extinguished her chance. The race was run in a pelting storm of rain, and a storm on Newmarket Heath seldom improves a horse's temper. We must suppose that Napolitain and Ecossais, both of whom have wayward dispositions, objected to the rain beating in their faces; for though both of them were favourably weighted, and the French horse was reported to have won a good trial, they kept close company together all the way in the extreme rear. The Pique also gave no consolation to her Cesarewitch supporters, and the finish was left to Wild Myrtle, Lady Patricia, and Genuine. The Irish mare ran well, but could not give away the year to Wild Myrtle, who won cleverly by a length, Lady Patricia finishing as far in front of Genuine, who thus obtained the place he just missed in the Great Eastern Handicap. The running in the October Handicap would appear to have little bearing on future events, except so far as Wild Myrtle and Lady

Patricia may be useful as guides to their owners in reference to the chances of other horses in their stables. We need only add that the minor races of the week were very poorly patronized, and that the printed notice of the Jockey Club, prohibiting ready-money betting, was utterly disregarded. Probably it was not seriously expected that any attention would be paid to it.

REVIEWS.

THE TRANSIT OF VENUS.*

SCIENTIFIC journals have of late teemed with communications, polemical and other, relative to the approaching transit of Venus across the sun. Now that the last of the expeditions sent out to view the transit has left our shores, we may expect a lull in this storm of papers, inasmuch as the time for suggestions and preparations is past. But the general interest felt in the matter by the public at large is rapidly increasing. Hitherto the matters discussed have rightly been of a technical character, as belittled discussions on so important a subject as the right steps to be taken in order to utilize to the full an occurrence of such rarity and interest. Such discussions were not likely to be appreciated by more than a small circle of readers, and it has chanced that the controversial element has been unusually largely represented in this case, so that those who might otherwise have been led to give attention to the matter have been repelled by seeing radical differences of opinion among those who were best instructed in it. In spite of an Englishman's love for a fight, he does not like to meddle with learned controversies on matters he does not understand, and prefers that doctors should get to agree amongst themselves before they call upon him to listen to their opinions. In this instance the amount of wordy debate was largely disproportionate to the real amount in dispute. Unfortunately for all parties, the chief disputant on the one side was a person in whose eyes the importance of the controversy did not end with the practical importance of the matter at issue. After the question had been settled by its being too late to adopt the measures advocated by Mr. Proctor, he continued the discussion with unabated interest. It took in his hands the form of a personal antagonism to the Astronomer Royal on the subject, and, though we think that much of this may be due to unfortunate peculiarities of style and temper, it is impossible not to notice in his papers a tone of personal assertion, of writing for one's own honour and glory. Still we admit that the object in view was a most laudable one. Mr. Proctor thought that a better use might be made of the opportunity in the interests of science, and he strove to convince people of the correctness of his views. But we doubt whether his papers on the subject will prove acceptable in the collected form in which they are offered in the present work, and we are sure that all the members of that numerous class which looks to Mr. Proctor as the best writer of readable books on astronomical topics will feel disappointed when they turn to it to learn something about the coming transit. Instead of finding information about the transit itself, they will have to content themselves with criticisms on the Astronomer Royal. Apart from whatever controversial interest they may have in the eyes of those who took part in the dispute, these papers possess no interest at the present time, and certainly are as unfitted for general reading from their technical character as would be the same number of papers chosen at random from a scientific journal. We do not know whether we ought to stigmatize it as a case of padding, or whether to think that it is due to an exaggerated estimate of the importance of the controversy now that its practical bearing is gone. But, whatever may be the cause of their appearance in the present form, we cannot too strongly express our disapprobation at the description of them on the title-page as "an investigation of the conditions of the coming transits of Venus recently confirmed by a unanimous vote of the chief astronomers of Great Britain." We presume that this refers to the unanimous vote at the Visitation of the Greenwich Observatory in 1873 on the resolution that Government should be applied to for means for additional expeditions to the Antarctic Regions. If this be so, it is so serious a misdescription that it is only to be pardoned by making great allowances for the heat of controversy.

We do not wish to resuscitate the dispute by an inquiry into its merits. All interest has been taken from it by the march of time, which has rendered the choice made by the Astronomer Royal irrevocable. Nor have we any wish to change the general impression left on the minds of the public—namely, that whether or not Mr. Proctor was right in contending that the Astronomer Royal had dismissed from his consideration the method advocated by Mr. Proctor in too cavalier a manner, and without assigning adequate reasons for so doing, he was at all events right in the main in deciding as he did, and had fully considered all sides of the question before so deciding. The point at issue was simply this. Of two methods of utilizing a transit of Venus in order to discover the distance of the sun from the earth, one requires observations to be made of the exact moment at which contact takes place either in entering or leaving the solar disc, and the other requires observations of the duration of the

transit—i.e. the interval between the two moments of contact. Hence the first-mentioned observations require the knowledge of the exact Greenwich time at the place, or, of what amounts to the same thing, of the longitude of the place. It is a difficult and tedious business to determine this with the degree of accuracy necessary for astronomical purposes, where a mistake of some twenty or thirty yards in the estimate of the distance of the instrument east or west of the meridian of Greenwich would make a perceptible difference; and hence it is natural that the other and simpler method should commend itself at first sight, since it requires little more than the possession of a tolerably good clock that will not vary its rate for a few hours. It is this latter method which the Astronomer Royal decided not to use, and the employment of which was so strongly advocated by Mr. Proctor. And the reasons for its rejection were very sound ones. Difficult as the determination of the exact longitude of a place is, it is, after all, a difficulty that can be overcome. The remedy is in our own hands; we must take extra precautions in order to ensure accuracy, but still we can then make sure of attaining to it. Such are not the hindrances which men of science now fear in connexion with the observation of rarely occurring astronomical phenomena, but the fatal and insuperable difficulties caused by bad weather and unfavourable atmospheric conditions. It will not soon be forgotten how completely useless were many of the observing parties in the total eclipse of 1870, when Professor Tyndall and Mr. Huggins took a party to Africa with no further result than being able to describe the phenomena of a wet day at Oran. The lands to which observers would have been sent had the method of durations been relied upon would have been situated in the extreme Antarctic regions, where the chance of favourable atmospheric conditions would have been very doubtful; and, moreover, the method fails, however excellently one contact may have been observed, if the other has not also been observed at the same place in an equally successful manner. These considerations led the Astronomer Royal to prefer the more certain though more difficult method, especially as, after all, mistakes in the estimation of longitude can be corrected by subsequent observation, if there is any reason to believe that in any case such mistakes have been made. That he was wise in so deciding we have little doubt, and this is confirmed by the fact that, of the very numerous expeditions that will go out to observe the transit, there is scarcely one that will use the method of durations except as secondary to other methods. It is not to be wondered at that irresponsible astronomers should be willing to pass resolutions advocating an application to Government for more money to be spent on additional expeditions. But this is a very different thing from the Astronomer Royal, absolute as he practically was so far as regarded the employment of the public money granted for the purpose, taking upon himself to advise expeditions the success of which was problematical. And, considering the exceeding difficulty of the duties which Sir George Airy had to discharge, we are glad to find so good a judge as Professor Forbes saying of him, in reference to the arrangements of the expedition:—

Fortunately we have in our Astronomer Royal a man who combines to an exceptional degree theoretical, mechanical, and organizing powers, and we may safely say that the present expedition has been completed under a generalship quite unparalleled in the annals of science. Sir George Airy has accomplished all that was required in a manner that has called forth the applause of those that have been connected with the preparations for this, perhaps the most important astronomical event of the century.

Professor Forbes's book, which is a reprint of some articles that appeared in *Nature*, is of a very different type from the part of Mr. Proctor's book that relates to the transit of Venus. It is a compact sketch of the whole matter in all its aspects—historical, scientific, and practical. Its only defect is that it is so short, and that in consequence it only touches on many interesting topics on which the reader would gladly have had more detailed information. For the general public who do not want to spend too much time upon it this will be no drawback, especially as, in spite of its terseness, it is marvellously complete, avoiding, however, with great judgment, all allusion to controversial matters. Its author is himself a member of the British expedition to the Sandwich Isles, a station which will be strongly occupied, and from which there is reason to expect excellent observations. From it we learn that the chief Southern observations will be made at stations belonging to three groups, the centres of which are New Zealand, the Mauritius, and Kerguelen Island. In the Northern Hemisphere the Russians will occupy a line of stations reaching from Teheran to Jeddo, but lying mainly in Siberia. Peking and Japan will each have three observing parties in their immediate vicinity, and Alexandria will be occupied by a British party in conjunction with which will be parties at Thubas and Cairo. In addition to these parties, certain observatories will be able to take observations, so that it is probable that the transit will be watched from between seventy and eighty stations. At each of these there will be several different methods of observation at work, some requiring actual observations to be made at the moment of contact, and some using photography for the purpose of obtaining permanent records of the phenomena, from which accurate measurements will be subsequently taken at leisure. It would not surprise us if the results obtained by this last method were found to be more trustworthy than those obtained by any other means. The best observer cannot calculate on being perfectly cool at the moment of seeing a phenomenon which he knows occurs only twice in a century, and to which he has been looking forward for months; and every astronomer is aware how the slightest excitement affects the accuracy of

* *The Universe and the Coming Transit.* By R. A. Proctor, M.A. London: Longmans & Co. 1874.
The Transit of Venus. By Professor George Forbes, B.A. London and New York: Macmillan & Co. 1874.

observations by altering to an unknown degree the "personal equation." All that could be done to practise the observers in their business has been done. For months they have been taking observations of artificial transits of Venus. A plate of glass, with an opaque spot to represent Venus, moves across a mock sun, so that the phenomena of a transit are made to occur in exactly the same order and at exactly the same rate as they will occur in reality. Not only does this train the observers to know for what they shall watch, but it enables them to compare their respective results, so as to be sure that they all consider the contact to take place at the same instant. For it must be remembered that the disc of Venus is of a finite angular magnitude, and takes a perceptible time to pass on to the sun's disc, and that, moreover, the phenomenon of irradiation causes the planet to appear to be only partially on the disc some seconds after it has in reality passed wholly on to it. But, with this preliminary practice, there can scarcely be any fear but that the observers will all record the instant of the occurrence of the same phase of the transit. Thanks to Mr. Janssen's ingenuity, their accuracy in this matter will also be tested by comparison with the results of photography; for he has contrived a method whereby photographs of the phases of the contact will be taken at intervals of a second during a space of time sufficient to cover the whole of the critical portion of the passage of the planet on to the face of the sun.

While these precautions are being taken to secure accurate observations at the moment, no less elaborate ones are adopted to secure the exact knowledge of the longitude of each of the stations. Many of them are in telegraphic communication with observatories whose positions are accurately known. In other cases chronometers will be taken to and fro between the stations and known spots until a sufficiently accurate determination has been made. Thus between Aden and the principal station at Mauritius, where Lord Lindsay has led an expedition admirably equipped at his own expense and under his own management, fifty chronometers will be taken to and fro four times, and the result will be flashed by sun-light signals to the neighbouring islands. All the English stations will make use of lunar observations, and the observers have orders to remain at their stations until they have obtained the longitude by this method to within one second. Nor shall we have to depend wholly on the success of these precautions. Other methods of observing the transit will be largely used which this question of time will not affect. For these last-mentioned methods it will be necessary that observations of the distance of Venus from the centre of the sun should be taken at repeated intervals during the transit. Here, again, photography will play an important part, as photographs can now be taken so perfectly that the measurements furnished by them are three times as accurate as those made by direct observation with the aid of the micrometer. The Americans are already well practised in this method, and with their instruments the image of the sun is formed always in the same spot, by the light being reflected down a fixed horizontal telescope, passing into a dark room, so that the operator has but to put in and take out the plates, without having even to leave his operating-room. It is interesting to compare these admirable arrangements with the simple ones made by the Rev. Jeremiah Horrocks for watching the first transit of Venus that was ever observed. Although he was a genius of the highest order, the best means he could devise were as rude as those which any schoolboy might now adopt. It is true that they cannot be taken to represent the state of science at the time, for he had not the command of the public purse, being only a poor village curate; but the comparison gives some conception of the advance that has been made in the means of observation through the progress of science since that time. Such are the benefits of the legacies left to the scientific men of one age by those of preceding ages. But though the observers will be equipped with all the aids that science can suggest, and though they will not, like him, be compelled to discontinue their observations while they go and perform service in church, yet we doubt whether the results of their observations, while of infinitely greater scientific value, will be presented to us in a form half so charming as the poor curate's quaint *Venus in sole visa*.

DELAUNAY'S GRÆCO-JEWISH MONKS AND SIDYLS.*

IN his recent volume, as in his *Philo*, which we noticed seven years ago, M. Delaunay deplores the neglect into which a branch of study once prominent among French scholars has since sunk in his country. Whatever may be said for Germany, there is nothing that England has done of late to give point by way of contrast to this censure of her neighbour. Of all contemporary centres of scholarship or philosophical thought, there is not one in which so little heed has been taken in modern times of that which was the real crisis or turning-point of European belief and intellectual life—the blending into one of Greek and Jewish thought in the school of Alexandria. Although England has put forth the best edition and a good popular translation of Philo, it is remarkable how little either our theologians or our writers of history have done to familiarize themselves with the teaching, or even with the language, of a school from which came forth the theology of Europe, and of which the great Jewish philosopher and allegorist is the sole extant representative.

* *Mémoires et Symbôles dans l'Antiquité Judéo-Grecque*. Par Ferdinand Delaunay. Paris: Didier et Cie. 1874.

Without a thorough knowledge of Philo, the commonest, yet at the same time the most fundamental, ideas and phrases of the Bible are without a key. Controversies will never end so long as terms like the "Word," or the "Son," on which turns all the dogmatic divinity of Christendom, or "Regeneration" and "Renewal," the cardinal point of her ethical system, instead of being set in the light of familiar use and read by the aid of contemporary and common speech, are treated like fossils from some far-off and alien stratum of language. Here are at hand the records of a school or a community in which words like these were in daily use and were understood of all. In order really to understand St. John and St. Paul, it is to Alexandria that we must go. We must turn over the pages of Philo. Shadowy as the figure of this Jewish sage may be, well nigh mythical as he may be thought if we regard the length of years assigned to him by tradition or imperfect report, mystic and unhistorical as he is all through his sixty or more treatises, he represents, as M. Delaunay contends, a group of writers who set on foot a great school of philosophy. Eclectic in its sources and in its spirit, that school was able to work into unity those ideas of God, of nature, and of man, to which the genius of the highest nations of antiquity had given birth. To the genius of the Greek for philosophy and art, to the organizing power of the Roman, whether in arms, in politics, or in social life, the Hebrew brought a theological faculty which at once absorbed and dominated the rest. At the outset a humble intruder or parasite in the great hall of nations, the Jew, says M. Delaunay, crept in unnoticed and took his place at the feast of civilization. Bent, but not broken, by captivity, persecution, and exile, by dint of suppleness and tact he became strong. Under all his show of humility there lurked the pride of a race cherishing mighty privileges and conscious of a high destiny. The hanger-on becomes the host. The cringing usurer wields enormous wealth and rules the markets of the world. The exiled heir of the promise is proclaimed the messenger of God to all nations of the earth. No longer exclusive as of old, or indifferent to proselytizing, the new Judaism sets itself to teach and to convert the world. Its colonies form everywhere centres of light, of learning, of social order, of religious zeal and fervour. The head of this new movement was Alexandria, and the most illustrious of its interpreters was Philo.

The Judæo-Alexandrine school, which had a life of some three centuries, had its speculative and its practical phases, both of which are represented in the writings of the Jewish sage. A mystic and ascetic germ brought from the land of its birth, though sprung, it may be, from a root more Eastern still, was to be traced alike in the theosophic development of its belief and worship and in the form of its institutions. An allegorical tone pervaded the whole of its exegesis. Its spiritual life ran largely into exaltation. There were two special forms in which its practical organization had its issue and found the secret of its power—those of monachism and of prophecy, the first an organ of internal action, the second an agent of external proselytism. In the one was seen the influence of the Temple service, in the other that of the Schools of the Prophets. The one had its inward working amid the solitude, the silence, and the austerity of the cloister. The other cried aloud in the streets in accents of warning and woe. Within was the Monk, without was the Sibyl.

M. Delaunay's work, which, despite a somewhat inflated style of writing, shows throughout careful scholarship and original thought, is divided into two parts. The first treats of the origin, doctrines, and rites of Jewish monachism, ending with a translation of the remarkable book in which Philo gives a picture of the contemplative life of the Judæo-Alexandrine monks, or Therapeutæ. The authenticity and date of this work are ably vindicated against the cavils of critics, of whom the most extreme, M. Grætz, has set it down as the fabrication of a Gnostic or Montanist of the third century. M. Delaunay goes on to determine, by a series of minute investigations of the text, whether the Alexandrine monks were Jews or Judaizing Christians, and in what relations they stood to the Essenes on the one hand and to Christianity on the other. It is no ideal or imaginary picture of the cenobite life, but the portraiture of a large and active community, which Philo has located on the spot made famous centuries later by the flourishing monastery of Nitria. The silence of Josephus concerning them is explained either by the jealousy with which the Palestinian Jews regarded their brethren of the colonies, or by his confusion of them with the Essenes. Between the arbitrary judgment of Montfaucon, who denies all resemblance between these two bodies, and the no less extreme view of Joseph Scaliger, who masses them in a common sect, a substantial ground is sought in what Philo himself depicts from his own observation. To the Essenes he has devoted a part of one of his treatises, *Onnis probus liber*, more full by far than the passing notices of Josephus or Pliny. A century and a half before Christ, the chief colony or college of the Essenes was planted not far from Hebron, the vestiges of which M. de Sauley believes himself to have discovered at Mar-Saba. Their name is interpreted by Philo to mean holiness. This body probably formed the extreme limit of a number of convents comprising four thousand inmates, within the triangle formed by the brook Cedron, Hebron, and Bethlehem. Of the Essenes of Palestine and the Therapeutæ of Egypt, it is difficult to say which body was prior in time. Their differences in point of usage or belief are, however, more distinctly traceable. The monks of Palestine, like the Cistercians, cultivated the practical rather than the ascetic life. The day was passed in the cornfields, amid the lowing of cattle or the hum of bees. At night each brother sought his solitary cell. There was among

them no such absolute contempt for riches and the good things of life as among the Therapeutæ. Even marriage was permitted in some places. The resurrection of the soul apart from the body was held by the Essenes. There is, on the other hand, no proof of the Therapeutist doctrine on these points or on that of eternal rewards and punishments. Here Philo is obscure. The seventh-day Holy Supper is common to both—a reminiscence and a symbol, the Jewish writer believes, of the shew-bread. The ablutions and mystic rites by which each sect preceded and accompanied it are highly noteworthy, especially considering that the institution dates in either case from a period earlier than Christianity. With the Therapeutæ the feast passes into ecstasies, with chants and promiscuous night-dances, such as those which formed the basis of the worst charges brought against the Christian love-feasts. From the manifold points of contact which Philo's remarkable picture makes evident, it is impossible not to see that much of both the spirit and the letter of Jewish monachism under each of its forms passed directly into the body of Christianity, and was reproduced in the convents and hermitages of the third and later centuries of our era. To say, indeed, that Christianity, or even Christian monachism or asceticism, is a mere copy of a Jewish or Egyptian original, would be absurd. The roots of the Christian faith are infinitely wider and deeper. What is, however, brought out more and more clearly by critical inquiries like the present is that the Gospel has given to the common and universal religious idea the widest expansion and raised it to the noblest possible height.

In the second half of his work M. Delaunay enters into an elaborate history and criticism of the Sibylline oracles, based upon M. Alexandre's admirable edition of those fragments. The body of poetry attributed to the Sibyls, as distinct from the Delphic and other oracles which applied to metespecial or individual occasions, goes back to an antiquity beyond that of the Homeric poems, among which many fragments of them are traceable, possibly as far as the tenth century B.C. Their source was in the Greek colonies of Asia Minor, where Erythra gave the Sibyl her best known name. Passing thence into Italian Greece, it was as the Sibyl of Cumæ that the well-known mythical personage came to Rome under the reign of the Kings. The sources of these mysterious sayings, multiplied from age to age, till Varro, fifty years before Christ, could enumerate ten groups of Oracles each personified by a separate Sibyl. A second collection of a thousand verses, according to the same authority, was brought to Rome from Phrygia by chosen deputies eighty years B.C., and was afterwards, in the reign of Titus, enshrined in the Capitol. Meanwhile another element had come into action in what M. Delaunay terms the Eleventh Sibyl. From Rome he takes us to Alexandria. The prophetic spirit of Judaism begins to play a momentous part behind the mask of the Sibyl of Erythra. To what extent, we have now to ask, is what may be called the cycle of the Hebrew Sibyl to be dated anterior to the Christian canon? If it may be regarded as independent of Christian sources, what do we learn therefrom as to the Jewish ideas of the period touching the person and the earthly advent of the Messiah, and the doctrine of the last things? To these points M. Delaunay addresses himself. As far back as the sixth century before our era the figure of the Messiah begins to loom on the Jewish mind. From the Captivity it takes a more definite form. The Son of Man, Son of David, Son of God, revealed by Daniel, had become a cherished image in the theology of the people. A hundred years before Christ, amongst Jewish theologians, especially at Alexandria, the idea and the name of the Word or Wisdom, the Breath or Spirit of God, came into use, and identified itself with the Son or Divine Word. In Philo all these terms have their recognized and definite use. The date of the book of Enoch at the same time becomes of paramount importance from its coming within the cycle of Messianic opinion. In a deliberate course of reasoning, which in the appendix he vindicates against the arguments brought in the interim by M. Maurice Vernes on the side of Colani, Noddle, and Hilgenfeld, M. Delaunay upholds the age of the book as anterior to that of the Christian revelation. Interpolations there may have been, he allows, as in the general Judæo-Alexandrine cycle, their clumsiness making them easy of detection. But, on the other hand, passages have been retained of a character so opposite that they could never have passed the hand of a systematic falsifier. This book, one of the most precious recoveries of modern literature, rejected as it is alike by Jews and Christians from their sacred canon, though quoted by Jude and Barnabas, uses the same words as Philo for the sacred personalities, even approaching to Trinitarian language. That it came forth from the monasteries of the Essenes M. Delaunay thinks it rash to affirm; but of the three groups into which its Messianic utterances may be divided, he refers the first to the time of Antiochus Epiphanes, 170 or 180 B.C., the age of our oldest Hebrew Sibylline Oracles, the second to the opening reign of John Hyrcanus, and the third somewhat later, about 144 B.C. The most striking of these prophecies are those of the fourth book, the apocalyptic visions of which run on to the triumph of the chosen race, the destruction of the Gentiles and of the earth, and the reign of the just in glory under the leadership of the Son of Man. Whatever turn may have been given to a passage here and there, the bulk of the book bears witness to its having been written before the fall of the Holy City.

Allusions to Christian rites and points of doctrine show that there must have been much tampering with the text of the Sibylline books, and disturb all calculations of their respective dates. Taking up M. Alexandre's learned criticism, M. Delaunay

believes himself able to arrive at results in many cases more precise and sure. The precedent of Philo convinces him that the mention of heavenly bread, *λαϊκὸν ἄρτος*, with which the *proemium* closes, involves no allusion to the Christian Eucharist. The fourth book does indeed speak of the capture of Jerusalem and of the eruption of Vesuvius, in terms too express for us to doubt that the passage was written as late as A.D. 80. M. Alexandre terms it the earliest of Christian Oracles. It is with M. Delaunay the last of the Judæo-Greek. The supposed flight of Nero, and his expected return from Asia, which some critics have discovered in the visions of the Apocalypse, and which appear in the text of the Sibyllist, need not be taken as ideas exclusively Christian; nor need there be seen, as Ewald agrees, any allusion to Christian baptism in the invitation to all nations to bather themselves in the rivers. At no time were symbolical washings unknown among the Jews. One passage recognized by M. Alexandre as referring to Hadrian is held to be disputable by our author, who yet allows the intermixture with the work of the Sibyllists of more than one later passage from history, as well as of scraps of Erythrean verses, derived, he thinks probable, from the colleges of the Therapeutæ. The residuum of genuine Jewish Oracles is contained, he considers, in the fourth book, together with four paragraphs of the third, of which two books he subjoins a literal translation, with able critical notes. The first and second books he passes by as manifestly from Christian sources; the second, in particular, betraying traces of the errors of Origen. The later books are likewise omitted as of even later origin, the work of Judaizing Christians down to the time when, by order of the Emperors Honorius and Arcadius, the whole of the Sibylline Oracles were as far as possible destroyed. With the revival of letters these remarkable collections came once more to light in a more or less complete or critical form, and much credit is due to Whiston and others for the attempt to assign them their due place among the Christian evidences. The time has now gone by for Christianity to have anything to fear from any inquiry which may throw light upon the circumstances that prepared for and accompanied its birth, or the influences that ministered to its growth. The cause of the Gospel as well as the truth of history can derive nothing but gain from the widest and deepest research into these rich deposits of knowledge which have lain so long and so strangely neglected among us.

THE DOUBLE NARRATIVE OF GRAVELOTTE.*

THOUGH not, as it has sometimes been wrongly called, the greatest battle of the world, Gravelotte exceeded all other battles of the late war in dimensions, and is surpassed only by Koeniggratz and Leipzig in vastness. Indeed, in point of numbers, it scarcely came behind the "Battle of the Nations," which destroyed French power as completely in 1813 as this did nearly sixty years later, whilst neither at Leipzig nor at Koeniggratz did either of the combatants dispose of a single army as large as that which obeyed Count Moltke's orders on the 18th August, 1870, as he moved to turn Bazaine from his chosen position. How this was finally done by the concentrated action of the German and Saxons, aided by part of the IXth Corps and such a force of guns as never acted together before, all brought to bear on the single corps of Canrobert; with what energy the stronghold of the French right at St. Privat was defended, and with what terrible sacrifice it was at last won; all this is an episode which must be more or less familiar to all who are not indifferent to the story of the war. Captain Hoffbauer's excellent work, though nominally confined to the action of the artillery, has already described that of the other arms in this tremendous contest with a precision which leaves little to be desired; and English readers have lately had the advantage of a good and clear translation of it by Captain Hollist, from which the details and their bearing on each other may be accurately traced. Or those who specially delight in deeds of heroism performed by infantry under circumstances in which advance seems hopeless may peruse profitably the admirable lecture lately published by Captain Helmuth on the action of "The Guards on the 18th August." But it is a morning's walk for a pedestrian to pass round the line which the 245,000 Germans formed in their attack on Bazaine's position. And the very name given by their official writers to the battle, the double title of Gravelotte-St. Privat, shows a consciousness that the attacks on the French wings were in fact almost separate actions. It may be added that their results were very different. For if the attack on St. Privat had been no more successful than the other, had Bazaine's troops been kept as ready to attack as they proved themselves stout to defend, it is not too much to say that the whole course of the war might even at that date have been seriously changed. The official historian does not tell this as plainly as other witnesses of the contest he describes. Yet in his own precise details there are indications that the cost of the die of battle for the possession of St. Privat, however desperate it may at one time have seemed, was absolutely necessary for the victory which could not be won elsewhere.

We are much tempted to turn aside from this part of the subject to show the pains with which the Berlin writer has gathered up from scattered French sources of information that story of Bazaine's own doings which has never been told consecutively before in an authentic form. This part of his work is unconsciously a special tribute to

* *Der Deutsch-französische Krieg 1870-71, redigirt von der Kriegsgeschichtlichen Abtheilung des grossen Generalstabes. 1ter Theil. Heft 6.*

the superior accuracy of his own nation, which, as on many like occasions, tells with exactness and precision those particulars which the French historians fail to afford of their own army. We pass this by for the present. But the general remark is necessary that it can no longer be doubted that Bazaine here repeated, or rather continued, that strange tactical error which had so paralysed his superior forces on the morning of the 16th. He still was oppressed with the idea, founded of course on his own false view of the strategical value to him of Metz, that the enemy would seek to cut him off from that fortress, instead of pushing him back upon it. Thus, whilst Moltke was deliberately extending his left to embrace the French right in that fatal pressure which finally gave him the victory, the commander of the Army of the Rhine still looked over his left southward uneasily to the green woods that lie between Gravelotte and the river passages near Gorze, anticipating some sudden issue from them of a force attempting to thrust itself between his line of battle and the high hill of St. Quentin behind him to which he attached such fatal importance. Not that he was wholly without justification for this error. The whole of the German IInd Corps, with the exception of a single battalion left to guard the royal baggage at Pont-à-Mousson, was moving down the river from that place on such lines that it might have been directed with a single word that way, instead of becoming, as we shall see that it did in the later portion of the fight, a direct reserve to the hotly engaged left under Steinmetz at Gravelotte. This General had also a few battalions of his own army detached from his proper front before the village to the south of the French, which were lost apparently to his real object, and too weak to effect anything separately, yet sufficient for a very important purpose if they really served to keep the French Marshal's attention riveted on this imagined danger. But what should have been Bazaine's security, had he fully weighed the chances, was the fact that the Germans could not possibly, even with the great superiority of force they were showing, have troops enough to envelop both flanks of so extensive a line as that which he held. He had ample means early in the afternoon, had he used them, of comprehending the tremendous nature of the combination which they were preparing for his right. That they should then be also turning his left by the difficult country between it and the Moselle would have implied that they had made the grave mistake of completely separating their force into two distinct assailing bodies, leaving him centrally placed between the two. As soon as he once knew that affairs at St. Privat were looking serious, the fact should have relieved him at once from the fancy which paralysed his whole action, and left him free to act on his part with the active energy which his earliest critics, as well as this his latest one, all agree to have been utterly wanting in the conduct of his great charge.

What had really to be done by the assailants in the first great stages of the battle—in other words, Count Moltke's tactical design—has never been more clearly and truly described than in the single sentence in which the volume before us tells it, in commenting on the necessity which urged the Chief of the Royal Staff to send stringent orders to General Steinmetz (whose desire to press into action had already shown itself at Spicheren and Borny), not to engage the First Army prematurely. "Since to the Second Army" (whose commander, Prince Frederick Charles, had just ridden to the front to push forward its advance on Amanvillers and St. Privat) "was assigned the task of making a decisive stroke at the enemy's right by simultaneous attacks on its front and flank, the First Army received in these directions its commission to merely occupy the strong front of the hostile left wing, at first in a cautious manner." We will follow briefly the official writer's account of its execution of these orders.

General Steinmetz's detailed instructions permitted him to engage his artillery early. Indeed before noon the French batteries on Bazaine's left were trying the range over Gravelotte in the direction of his reserves, and soon after the batteries of the VIIth Corps replied to them. To secure these the 15th Division, including half the infantry of that corps, was pushed forward, and so came exactly opposite the French left under Frossard, but with the deep ravine which all travellers remember to lie just on the Metz side of the village of Gravelotte, intervening between the opposed forces. The steepness of the eastern side of this gully makes it appear a terrible obstacle to the inexperienced eye which tries to imagine the German advance. But a far more serious matter to a practised soldier's eye must have been the plateau beyond rising gently up to Point de Jour, the key of the French left, across which some tiny lines of fresh-thrown earth showed that the French had covered the front of Frossard and of Lebeuf, who lay next to him, with the line of musketry trenches, to the future use of which their late military oracle, Marshal Niel, had attached so much value. The artillery contest soon waxed warm. The German batteries in their eagerness pushed beyond the line first indicated. The infantry supports thought it necessary to move forward with them. Individual officers (p. 784), with a dangerous excess, as it seems to us, of the independent bearing encouraged by the system under which they had been trained, began to throw single battalions, or even companies; certainly without orders, probably they themselves hardly knew why; across the belt of comparatively level space just above the ravine where advance was easiest. And before 2 P.M. the first of the advances was made on this part of the French position, which were successful only so long as the Germans were covered either by the steepness of the lower slope or the thickness of the bushes that abound there, but which ended in their being "swept back as with a broom"—we use the expres-

sion of a German eyewitness—when they emerged on the plateau itself, and the French skirmishers, disappearing rapidly before them, left the ground clear for the deadly action of the Classepot from behind those slight-looking breastworks. Long and desperately was continued the skirmishing thus prematurely begun on the north side of the Gravelotte-Metz road. The VIIth Corps carried early the most advanced musketry trench, which had been placed to look down the valley below, and was so advanced, therefore, as to be isolated from the French general line; but its infantry could not get beyond this. It was not until the VIIIth Corps came strongly into the fight by its side, and their batteries had asserted the usual superiority of the German artillery in these battles, and driven Frossard's fairly to the rear, that the real first object of these attacks was gained, and a lodgment made in the large farmhouse of St. Hubert, which stands by the main road leading westward from Gravelotte, about half way up the rise of the hill to Point St. Jour.

With the capture of this position Steinmetz's advantages ceased. As the official writer says it up, Frossard's corps and Lebeuf's (lying to his right or north) had been occupied, and prevented from supporting the French right wing, but their real position was quite unshaken. And one division of the VIIth Corps was already quite unfit for further action; whilst the other, and the VIIIth Corps, had already suffered severely. Indeed there is a distinct admission in this part of the narrative that both the leaders and their troops overrated the advantages which had been won, and thought erroneously that only a single push forward was needed to carry the enemy's line. Events soon proved this to be a mistake. In vain the German batteries boldly pushed down into the gorge along the road and strove to crown the height beyond. Their guns were stopped one by one in the hollow, or put out of action as they tried to deploy in face of the storm of bullets on the slope of the French side of the ravine. In vain the 1st Cavalry Division followed this desperate effort, and its leading regiment, the 4th Uhlans, struggling through the stream of confusion that choked the road about the hollow, galloped boldly forward. Its leading sections fell at once, swept down, man and steed, by the murderous fire. The horse battery which it had carried forward with it was driven back into the ravine utterly ruined for further action. And General Hartmann, warned by what he witnessed of the impossibility of the intended enterprise, unwillingly gave the order to draw his troops off. The French infantry cheered and pressed forward exultingly from their trenches. The advanced companies of the Germans followed the rearward movement of the cavalry. And at half-past four there was what the official writer calls a "sensible retreat" on this side. In plain words, a decided panic had set in; but it is affirmed in the same sentence which admits the fact, that it was not of long duration. In truth, as is elsewhere explained, Bazaine's false views of the situation prevented his reaping any advantage from Steinmetz's rashness and Frossard's brief success. The King himself, who watched the stream of fugitives, ordered up the intact IInd Corps to the support of the shaken First Army, and the conflict, which, from the French failure to advance in turn, had died away before Fransecky brought its divisions on into a mere skirmishers' fire on either side, was taken up with renewed vigour by the Germans, and continued until the success of Prince Frederick Charles at St. Privat decided the retreat of the whole French army. There is no more striking example in history of a great tactical opportunity thrown away than the passive conduct of the French Marshal, and his utter inability either to comprehend the danger on his right or to follow up the temporary success of his left. We have not of course judged solely by the text of the able volume before us. Obvious reasons compel us not to overlook other narratives of the contest. But the official history is too full and too honest not to show to the discerning critic that the one opportunity allowed to the French for saving St. Privat was in the moment of their brief success before Gravelotte, and that the opportunity, whatever it was worth, was marvellously thrown away by the fatuity or dullness of their chief.

A ROSE IN JUNE.*

WE might briefly criticize *A Rose in June* by saying that it is a short story in Mrs. Oliphant's best style. The workmanship throughout is what might be expected from so experienced a literary artist; whilst there is a freshness of tone which is too often absent from the later works of voluminous writers. The plot of the story is of the slightest. It is the old theme which has been treated over and over again from the very dawn of literature. The Rose from whom the story takes its name is a charming young lady distracted between two lovers—one elderly and rich, the other young and poor. We need not say which of these suitors is favoured by the prudent mother, or to which the heart of the lady herself inclines. Neither need we trace the changing circumstances by which the heroine is alternately forced to the brink of a worldly marriage and saved from that painful necessity. It is enough to remark that Mrs. Oliphant has not been anxious to strengthen the contrast between the contending forces. The lover recommended by worldly considerations is not painted with horns and hoofs; he is a gentleman of much good taste and refinement, though betrayed into one questionable manœuvre by his suspicion of a rival; and he is

* *A Rose in June*. By Mrs. Oliphant. London: Hurst & Blackett, 1874.

shocked when he discovers that an alliance with him has been regarded by the girl's mother from a commercial point of view. Nor, again, is the mother a purely selfish or tyrannical kind of person. On the contrary, she has really a great deal to say for herself, and we are half inclined to suspect that most mothers of marriageable daughters in distressed circumstances will be very apt to take her view of the question. For ourselves, we confess that we sympathize very strongly with Mr. Incedon, the rich middle-aged lover. Of course we should have been sorry that Miss Damerel should have married him merely for his fortune, and perhaps he ought to have been more repelled by her obvious reluctance. But we decidedly condemn Miss Damerel's taste. Mr. Incedon, as we have said, is a man of thorough cultivation, of decided character, and of much honourable feeling. Though we have called him middle-aged, we have spoken merely on the conventional assumption of novelists, who regard a man of five-and-thirty as decidedly in the decline of life. For reasons which need not be fully explained, we are ourselves inclined to hold that five-and-thirty is about the age at which a man is best qualified to act the part of a youthful lover. And we fancy that Miss Damerel is rather childish in preferring a mere lad, ten or twelve years younger, who has no apparent recommendation except the very doubtful one of a commission in the Royal Navy and a sailor's facility for falling in love at a moment's notice. Indeed in the last page of the story Mrs. Oliphant delicately hints that some slight feeling of regret lingered in her heroine's mind when she thought in later years of her rejection of Mr. Incedon. However this may be, we must admit that Mrs. Oliphant is true enough to nature. Charming young ladies do not always prefer good scholarship and a love of the fine arts to the qualities which are most generally characteristic of our naval heroes. When women are thoroughly educated they will perhaps come to recognize the superiority of middle-aged scholars to youthful sailors; but Mrs. Oliphant is so far painting from the life. Her story and its characters make no demands upon our credulity. She might have found her models within the limits of any country district of moderate size; and the passions by which the story is worked are such as we could all exemplify from our own experience. If the fortune of an uncle drops in rather more opportunely than frequently happens in real life, we must admit that uncles sometimes die in reality, and even leave fortunes to their relatives; and that, at any rate, the expedient may be fairly allowed in the world of fiction.

One mode of praising such a book would be to appeal to the rather over-quoted example of Miss Austen, and to praise Mrs. Oliphant for not indulging in bigamy or murder. Negative commendation of that kind should go a very little way. People may be models of every domestic virtue and yet be naturally dull; and novels, as we know by woeful experience, may be fitted to lie on the table of every country clergyman in the kingdom and be as soporific as the dullest of the clergyman's sermons. Mrs. Oliphant deserves praise of a more positive and of a much rarer kind. *A Rose in June* is a novel which rises above the ordinary standard, not merely because it is lifelike and free from objectionable excitement, but because its accurate pictures of ordinary English life are coloured by a peculiar vein of delicate irony which betrays the presence of an unusually keen observer. The characters, it is plain, have been drawn by a very kindly and yet a very shrewd artist, perfectly alive to their weaknesses, and yet noticing them with an eye too sympathetic to be cynical. Each of them has little weaknesses which amuse without shocking us, and which give individuality to portraits of rather commonplace people. The girlishness of the heroine is charmingly exhibited by her feeble attempt at eloping, after the model of the novels which she had studied, into the world at large; and we are touched as well as amused by the absurdity of the proceeding. Another admirable touch is the *naïveté* with which she assumes that as soon as she becomes rich she is justified in breaking off the engagement which she had contracted in her poverty, though at the same time she recognizes, when it is put before her, the duty of sticking to her word in spite of consequences. With equal skill, the worldliness of the mother who insists upon the rich marriage is presented in such a way that we feel how much is to be said for her on the purely common-sense view of the subject. A coarser satirist would have made the maternal schemer simply selfish and brutal; Mrs. Oliphant makes us feel how closely the prudential motives are blended with a really praiseworthy desire for the substantial welfare of a young family. But the best character in the story is one who has a less conspicuous part to play, and whose death is made necessary at an early period by the exigencies of the plot. Mr. Damerel, the father of the heroine, and the parish clergyman, is drawn to the life with really admirable skill. We could have wished to see more of him, though his death, as we shall presently observe, is perhaps the most telling chapter in the book. He is a man of delicate tastes, whose thorough selfishness and frivolity is concealed from himself and from all his family by the graces of his manner and his excellence in an ornamental point of view. His wife slaves and toils to avert the consequences of his self-indulgent extravagance, and yet he puts on quite naturally an indefinable air of moral superiority when he reproves her for being, like Martha, careful and troubled about many things. Both his wife and his daughter, though suffering from his indolence, fully accept his view of the situation; the hardworking curate who does all the rector's duty has only a dim perception that his superior is a bit of a humbug; and the parish generally has the highest respect and esteem for

a man who does nothing so gracefully, and a corresponding contempt for the more industrious, but clumsy, subordinate who really keeps things going. When the rector is induced to visit one of his poor parishioners and catches a fever in consequence, everybody is dismayed; it seems to be an impertinence in death to catch hold of a man so far removed from all associations with dirt, squalor, and the generating causes of disease. When indeed the disease takes a long time, instead of immediately culminating in a dramatic fashion, the neighbourhood has a tacit sense that it has been wronged by the delay, though of course the open expression of such a feeling would have been repelled with horror. The deathbed of poor Mr. Damerel is exquisitely described. Inferior artists would have dwelt upon the more obviously tragic element, and would perhaps have wished us to listen to a sudden explosion of remorse for ill-spent time. Mrs. Oliphant's conception is much truer, and more really forcible and pathetic. Mr. Damerel remains himself to the last; he knows that he ought to die with a certain dignity, and that, as a clergyman, he ought to have certain religious sentiments. He is not a sceptic, and he is every now and then betrayed into a solemn mood of feeling, or into anxiety about the state of his family, whose prospects have been damaged by his systematic carelessness. But the prevailing tone of his mind is a kind of half melancholy and half pleasurable curiosity as to the strange mystery which he is entering. He feels himself tired, and resolves to leave all questions about his boys to a practical friend who will know what to advise. He quotes scraps of poetry; he repeats "the casement slowly grows a glittering square" (he should have said "glimmering"), and tries to think where the line occurs; and then he quotes Gray's line about "dumb forgetfulness" and makes a critical remark or two on their beauty. He laughs softly, like a child, at the strange fancies which come into his head—a laugh which naturally shocks the hearers, and makes them attempt vainly to lead him into a more serious mood:—

"Why, man, don't look so grave," he says to his curate; "and you, my dear, don't cry, to discourage me. Set me out on my journey a little more cheerily! I never thought much about dying people before; and mind what I say, Nolan, because it is your work. Of course to those who have never thought about such matters before religion is all-important, but there is more in it than that. When a man's dying he wants humouring. Such strange fancies come into one's head. I am not at all troubled or serious to speak of; but it is a very odd thing, if you think of it, to set out on such a journey without the least notion where you are to go!"

The extreme "oddity" of death is not the thought which would occur to most people under such circumstances; but the reflection is admirably characteristic, and shows Mrs. Oliphant's true vein of really powerful humour. Writing of this kind is not perhaps likely to be very popular. Vehement repentance or an outbreak of profane indignation might have gratified some tastes. But the admirers of the more delicate forms of literary skill will probably think that the deathbed of Mr. Damerel, which of course suffers in our brief description, is really a very remarkable piece of writing and is enough to give to the book in which it occurs a very high place in contemporary fiction.

NATURE'S REVELATIONS OF CHARACTER.*

THERE are certain books which make one almost despair of science, and this is one of them. Dr. Simms does not belong to the class of circle-squarers, earth-flatteners, or universal cure-mongers. His design has nothing absurd in itself. He has no special craze that we can discover, and he can even talk of his undertaking in a manner not inconsistent with his knowing how to set about it. Nevertheless he has written a volume of hopeless and irredeemable unwisdom. As far as the introduction goes, there appears no reason why the book should not be worth something; the only ground of suspicion is a vague and bombastic style, coupled with a general slovenliness in referring to other subjects which one seldom meets with in a writer who really knows his own subject, and this is by no means conclusive. Men of very imperfect general education have done good special work before now, and a charitable construction of Dr. Simms's opening chapter might lead one to expect something of this kind. He states in effect (though with much needless magniloquence) that every feature of a human being has a history and meaning of its own if we could only find them out—which is quite true; that certain rough inferences founded on this belief are already acted upon to some extent by mankind in their dealings with one another—which is also quite true; that a special aptitude for making such inferences, in other words the gift of reading character, is of great use to those who possess it—which is also true; and that knowledge of this kind is capable of being made scientific—which we think is also true. We can see no reason why physiognomy should not some day become a definite and useful branch of the science of human nature; but we also see great reason for not expecting it to be done in a hurry. More observation of certain features as signs of character, however extensive and systematic, would carry us a very little way. Anyone moderately acquainted with scientific method must see that the conditions of the problem are far too complex to be dealt with in this fashion. In such a case we can only get a body of evidence roughly confirming what is roughly known already; or else, if we try to make our statements look more exact, the results become conflicting and illusory.

* *Nature's Revelations of Character*, &c. By Joseph Simms, M.D. Printed for the Author. 1874.

The conclusions would be superfluous so far as they were intelligible, and unintelligible so far as they pretended to be real additions to knowledge. At most we should have a certain increase of the available raw material for science.

The way to the really scientific treatment of physiognomy will probably be found to lie in the careful and patient working out of the line of inquiry which has been opened by Mr. Herbert Spencer in the new edition of his *Psychology* and by Mr. Darwin in his work on the *Expression of the Emotions*. What we want to ascertain is not merely the signs, but the physiological interpretation of the signs. We ought to know whether the same feature may not tell two or more quite different stories, to what extent characteristic signs may persist by inheritance notwithstanding the loss or transformation of the thing signified, and many other matters of the same sort. These difficulties are not likely to be insuperable, as they do not differ in kind from those which have been overcome by other sciences dealing with complicated effects. But it is plain that no one who ignores such difficulties can do much for the advancement of this or any other new science. Now Dr. Simms ignores them all with a perfectly sublime ignorance. Notwithstanding his high scientific talk, he has not the least notion of the difference between science and the raw material of science. He says that his results are the fruit of twenty years' observation, and we may not be wrong in guessing that his observations might possibly have been of some use if he had known what to do with them. But he most unhappily takes his results for science, and so he has presented them in such a form that they are utterly worthless even as raw material. Dr. Simms gives us nothing better than a long list of "human faculties," most of them called by fearful and wonderful names of his own invention. Under the head of each faculty there is a dogmatic assertion that a particular feature or conformation is the mark of that faculty. These assertions are generally (but by no means always) supported by woodcuts showing one positive and one negative instance. One or both of the instances are often irrelevant, as when the negative instance is simply the head of some savage or illiterate person taken at random, who is presumed to be deficient in everything. As a rule it is quite impossible to discover on what evidence, if any, Dr. Simms has formed his opinions. Sometimes indeed one can catch him openly making conjectures *a priori* from an assumed likeness of things. In particular he has unconsciously taken up the medieval doctrine of "signatures" in the crudest form. A straightforward character is indicated by straight limbs and features, but curly men are round-about and untrustworthy. This proposition is illustrated by a fancy picture of a curly man wearing a curly coat (the coat is hardly fair), who is described as a "fairy, self-h, conceited, and deceptive scamp." His full moon-face is rebuked by the stern gaze of a hideously square-jawed, square-headed, and straight-haired profile—even the top of the ear is quite square—who is the type of a "systematic, punctual, and straightforward gentleman." The moral is further pointed by a vignette which represents "a curly, ambitious, and jealous dog." Again we are told that it is useless for a round man to try to be an architect or for a square man to try to be a watchmaker; for if a man is "not himself built upon the mechanical principle and with large bones, he will be quite unable to distinguish himself in dealing with square objects," while "to enable a man to do and judge of round work, it is necessary that he himself should be built on the round plan of human architecture." It does not seem to have occurred to Dr. Simms that, according to this, the same man cannot possibly be competent to build a wall and a dome, and whoever understands the geometry of the straight line must be hopelessly incapable of learning the geometry of the circle. In like manner a cadaverous man "is entirely devoid of taste or judgment in the matter of colour, and he is so, simply because by the infallible law of nature no man can judge outside of himself that which does not enter into his own composition."

But enough and to spare of this. The only compensation we can offer to our readers for having troubled them so long with Dr. Simms's science is to give a few specimens of his additions to the English language and of his miscellaneous information. Here are four consecutive names of qualities from Dr. Simms's first group; *Animadimentality*, *Aguasorbiliceness*, or love of water, *Physioelpidicity*, or hope relating to bodily wants, *Graspativeness*, or love of gain. Then we have *Temporinaturalitiveness*, or the power of appreciating the lapse of time. This affords another charming example of the doctrine of signatures. Round-shaped men are the best judges of time, because "the planets are all constructed on the round form and all their motions are in circles more or less precise." The "more or less" precisely circular motion of the heavenly bodies is edifying; even the Ptolemaic astronomy had found out that it was a good deal less, though it admitted the fact in such a circular manner as to afford convincing proof that Ptolemy must have been a very round and temporinaturalitive man indeed. *Touirreceptionality* is the ability for appreciating sounds. For a negative instance there is a woodcut of "the un-musical ear" with a square top; comparing this with the straightforward gentleman before mentioned, we gather that straightforwardness and musical genius are incompatible. *Persistency* is the disposition of holding on. If we believe Dr. Simms, he has induced some one else to use the word, for he professes to give us the portrait of a gentleman who once said to him, "I have lost thousands of dollars through my excessive persistency." Not content with having invented these and other unutterably barbarous words, Dr. Simms humbly explains to his countrymen (for he is an American)

that it is not his own fault if he spells English correctly. "The work having been printed and stereotyped in Britain, the old style of spelling used in that country has necessarily been employed," and we lose the advantage of knowing what Dr. Simms's new style would be like. Dr. Simms describes the faculty of credulousness as an excellent virtue, by means whereof Harvey discovered the circulation of the blood; and whenever he has occasion to mention things in general, he shows that it is very fairly developed in himself. On two opposite pages he gives us three centenarians, warranted 164, 172, and 185 years of age respectively, which is the more curious as their old age has nothing whatever to do with the faculties supposed to be illustrated by their portraits. He likewise believes all the stories of giants he has ever met with, and gravely informs his readers that "the giant Terragus, slain by Orlando, nephew of Charlemagne, was 28 feet high." Also he quite believes in the Scipiods, though in his picture the foot is nothing like big enough to serve as an umbrella, and almost believes in the men whose heads do grow beneath their shoulders. He further seems to believe that he has procured authentic portraits of St. Judas Thadous (*sic*) and Josephus. In one place we find some curious ethnology. It appears by Dr. Simms's list of European races that the Germans are Teutonic, the Hollanders Dutch (which we therefore presume is something quite different from Teutonic), and the English are Cockney or Devonshire. We are lost in possible interpretations of this. Perhaps the Cockneys were non-Aryan aborigines on whom neither Celtic nor Teutonic conquerors could make any impression, and Devonshire is only a local variety of Cockney. Perhaps Cockney and Devonshire are two distinct races which fell from the clouds all over England about the same time, and are now hopelessly mixed up. Or perhaps it is a grand stroke of satire which British understandings cannot be expected to appreciate. As a "specimen of European" in general (notwithstanding these startling differences of race), we have a villainous caricature of King William of Prussia, who is described by no other title. We shall see, however, that Dr. Simms can use the title of Emperor with great effect when he pleases. Another eminent living man of quite a different sort, Mr. Darwin, fares no better on another page, and a still worse treatment is reserved for the author's countryman, Mr. Henry Ward Beecher, who figures as an example of a "shaved and popular Christian." We know nothing to match this conjunction of epithets, unless it be the description of George III. in an old school history as a "bald but obstinate monarch." As to the larger varieties of mankind, the white race is shown to be the most perfect by the method of reasoning we are already familiar with—namely, because white is the purest colour. Dr. Simms's general philosophy is an optimism which goes so far that he points out in the following touching passage how grateful new countries ought to be to old ones for exporting diseases to them:—

The vessel which carries within her the seed of intelligence and culture is scattered over some bright trans-oceanic country, beats with her also the elements of disease of which the new country knows nothing; but for which its heart is grateful in after years, when able to look at things with a common sense, philosophic eye. That which is superfluous, nutritious to get rid of, not only in things inanimate, but among men as well, so that during a campaign, as it deserts with the number shot on the field, she scatters disease among the unwounded, until the slain in battle are as nothing compared to those who gradually succumb to consumption, fever, &c. Thus do we see working around us a beautiful balancing machinery, which, while lopping off individuals, makes arrangements for the prosperity and happiness of the whole.

We trust that Dr. Simms will head the subscription-list whenever it is proposed to balance the statue of Jenner with that of the nameless benefactor of Europe, and therefore of all European settlements in America and elsewhere, who first imported small-pox from Eastern Asia.

We generally expect to learn something of our own institutions from foreign writers, and here we are not disappointed. We learn that all Eton boys can climb trees by nature, and that a Committee of the House of Commons "waited on" Brindley on purpose to ask him what rivers were made for. Early in the book we find some paragraphs on self-made men, and under this head Dr. Simms is able to tell us positively that Homer was the son of a small farmer. He also contrives to excel the common mis-spelling of Claude's designation; *Lorraine* we are accustomed to, but *Claud Lorraine* is a novelty. But there are also more modern instances taken from those inhabitants of New York who pay an income-tax of (on?) 100,000 dols. and over. It is inspiring to know that "E. T. Morgan commenced life with a quarter measure of molasses"; that "the brothers Seligman started out in life with a pedlar's pack" (two brothers to one pack?); and that "David Dows retailed pork by the half-pound and molasses by the grill." In the matter of classical antiquities we hear that "Josephus Scaliger committed Homer's *Iliads* and his *Odysseys* (*sic*) entirely in twenty-one days." There is also a brilliant passage on the physical education of the ancients:—

About three hundred and ninety years after the founding of the great Roman Empire, and even at the time when the tyrant Caracalla ruled Rome, the practice of rope-dancing was one of the popular games, and it developed the Muscular system in a remarkable degree. In the days of Socrates, leaping was a common amusement. Alexander had many expert runners whose muscles were finely developed; and Glaucus excelled in many kinds of gymnastic feats.

Hence it appears, among other things, that rope-dancing is especially fitted to excite the hatred of tyrants, and that it was generally practised by Roman citizens. As for Glaucus, there might be some difficulty in selecting him from the half-dozen of

mythical and the dozen of historical persons who bore that name. One mythical Glaucus was indeed great in horse-racing, and one historical Glaucus owes the preservation of his memory to having excelled, not in "many kinds of gymnastic feats," but in boxing. We have kept to the last that which is perhaps Dr. Simms's most brilliant invention. One of his illustrations is "Charles VI., Emperor of West Austria, who died of dyspepsia." We know on high authority that *theologi non curant grammaticam, quia non est de sua facultate*, and by parity of reason a doctor of medicine might perhaps be allowed to speak of the Emperor Charles VI. as Emperor of Germany. But this grotesque and circumstantial anachronism is beyond any possible comity of faculties. Such a monster as an Emperor of West Austria in the last century—why West? and does Dr. Simms think there was another Emperor of East Austria?—would have had no need of dyspepsia to kill him. He would have perished of sheer astonishment at his own existence.

We find some slight internal evidence that our author has something to do with Boston. If so, he is a prophet not likely to find much honour in his own country, and he has done very wisely to have his book printed as far from Boston as possible. For there are two or three people there who know nonsense when they see it, and there is at least one such person who is both a physiologist and a humourist. We should almost feel moved to pity Dr. Simms if he fell into the hands of Dr. Wendell Holmes.

FORDUN'S CHRONICLE OF SCOTLAND.*

WE feel amazed as we look at the date even of the later of these volumes. We feel sure that they must have reached us at a time much nearer to the present than even the second of their dates. We cannot believe that they have been waiting for notice at our hands for three, or even two, years. At any rate, if it be so, we will do our best to make up for our fault by not delaying any longer to say what we have to say about a really important contribution to the history of one part of our island. Yet when we use these words, when we speak of such a book as Fordun's Scottish Chronicle as an important source for Scottish history, it shows how much lower the standard of Scottish history is than that of any other part of the British islands. This Chronicle, which is in some sort the national history of Scotland, would not count for much either in England, in Ireland, or in Wales. Each of these countries has an early historical literature of its own, in its own distinctive language. It can hardly be laid to the blame of Scotland that she has no such literature in her own tongue; for the truth will out, that, as distinguished from the English, the Welsh, and the Irish of different parts of the Scottish dominion, no Scottish language ever existed at all. But, without asking for a fourth language in our island, we should have been well pleased to match our West-Saxon and Mercian Annals with an English Chronicle in the English of Lothian, our Irish *Chronica Scottorum* with other Irish annals north of the Scotswater, and, most of all, should we have been well-pleased to match the *Annales Cambrie* with *Annales Cambrie*, and the *Brut y Tywysogion* with a record of the Celtic princes of Strathclyde in their own tongue. But these things are not to be had. We are driven to be thankful for the *Chronicon Pictorum*, and for the scraps which we find here and there in the Chronicles of England and Ireland. It marks the difference in this respect between Scotland and the other three parts of the kingdom that we have here a work of which its editor says with perfect truth that it "is unquestionably one of great importance for the history of Scotland prior to the death of James the First, and must form the basis of every history of that period," but which he does not venture to look on as thoroughly historical till it reaches the twelfth century. Here is the history of Scotland put into shape by one whom we believe to have been an honest and careful, and, for his time, not undiscerning writer. But the thing is not done till the fourteenth century. What would English history be if we had nothing earlier than Walter of Hemingburgh, or, throw a century in, and say earlier than Matthew Paris? Yet, even if our earlier and better writers were lost, we should not be so badly off, from the mere fact that there once were earlier and better writers, who left their mark on those who came after them. Thus, if we had to get our early English history from even the best writers of the thirteenth century, we should get a history largely mixed up with fabulous elements, but it would not be so essentially fabulous as the early parts of the Chronicle of John Fordun. Yet we are not at all disposed to find fault with John Fordun, who seems to have done his best according to his light, and who was in the unlucky case of having to make bricks without straw. Whatever we find to say against him, he is accurate and impartial compared with Harbottle and Blind Harry. And he has been interpolated and continued by compilers worthy of much less respect than himself. Mr. Skene therefore has done a real service by teaching us to distinguish between the two elements in the so-called *Scotichronicon*, and in giving us an edition of the genuine work of Fordun as Fordun wrote it himself.

Mr. Skene's preface is almost wholly concerned with the literary history of the book which he edits. But of this he gives us a

very clear and satisfactory account. Hardly anything is known of John Fordun personally, but he seems to have been a priest attached to the church of Aberdeen. He left behind him five books complete, and materials for others to follow, which are here printed under the name of "*Gesta Annalia*." The book must have been written, or at least put into shape, between 1384 and 1387, because he speaks of Walter Wardlaw as Bishop of Glasgow and Cardinal, a description which belongs to those years only. But it seems that Fordun's own work existed in an earlier and a later shape, and that the later shape was largely the result of a journey in England and Ireland, in the course of which, among other things, he became acquainted with the writings of William of Malmesbury, from which he makes large extracts. The work was continued by a writer who was born in 1385, who began to write in 1441, and who ended in 1447, all these dates being given by himself. This continuator is said to have been Walter Bownmaker or Bower, Abbot of Inchcolm, a person of whom Mr. Skene says that nothing more is known. But in another manuscript another author is to be traced, who promises a history of Joan of Arc, which was never finished, or which has been lost. This is a pity, because the writer, whoever he was, could have spoken from personal knowledge, and it would have been well to have a Scottish version of those times written from personal knowledge. This writer promises to speak not only of Scottish matters, but also

de quibusdam aliis actibus misticis quos ego qui scribo extra limites regni scivi, vidi, et audivi. Item postremo de quadam puella mirabili, que causa fuit recuperationis regni Francie de manibus Henrici tyranni regis Anglie, quam vidi, novi, et cum ea in quibus suis dicta recuperationis, usque ad finem vite sue presens interfui, &c.

Mr. Skene makes some remarks on the kind of changes and interpolations which Bower made in turning Fordun's materials into the shape of a regular history. In so doing "he has unfortunately altered Fordun's narrative in many instances, and that not merely in an arbitrary manner, but evidently with the object and intention of presenting the events in a different aspect from that in which they appear in Fordun's narrative." "They can, in fact," adds Mr. Skene, "only be viewed as intentional falsifications of history to suit a purpose." The instances which he quotes refer to the coronation of several of the Scottish Kings, as Malcolm the Fourth, Alexander the Second, Alexander the Third, Robert Bruce, and David the Second. In his account of all these ceremonies Bower has tried to represent the coronation of the Scottish Kings as more solemn, more ecclesiastical, more like the contemporary custom of England, than it really was. He tries to put its really primitive and Celtic nature into the background, and he makes Alexander the Third be anointed by the Bishop of St. Andrews, while, according to the true account preserved by the genuine Fordun, David the Second was the first King of Scots who received the ecclesiastical rite. The object is clear—namely, to represent the King of Scots as an anointed king, the peer of the King of England, and therefore not his vassal. This is one theory; according to our theory, so far as we have one, it was perfectly right that David the Second should be the first King of Scots to be anointed, because he was the first King of Scots who succeeded after the establishment of the independence of Scotland by the treaty of Northampton. We have also a lurking satisfaction when Mr. Skene, on the authority of Fordun, rehabilitates Sir Francis Palgrave's "*Seven Earls of Scotland*," who have latterly been somewhat under a cloud.

The changes which Bower made in the text of Fordun remind us somewhat of the changes which Matthew Paris made in the text of Roger of Wendover. Matthew was much too good an Englishman, and much too strong a foe of the Pope, for us to call him such hard names as Mr. Skene calls Walter Bower. But it is plain that Matthew took liberties of nearly the same kind with Roger's text, that he changed the colouring of the story according to his own widely different views of politics. It may be that Archbishop Hubert's speech on elective monarchy is as little authentic as the ecclesiastical unction of Alexander the Third. Still, even if it be so, it has a value which the other statement has not. But the two cases are closely parallel, and to get the original text of Fordun is a gain of the same kind as it was to get the original text of Roger of Wendover, and it is one for which we thank Mr. Skene very heartily.

The early part of Fordun's work is essentially mythical, as no one more strongly proclaims than his editor. Like all compilations of the kind, the work increases in value as it gets nearer the writer's own time, till towards the end it becomes a contemporary narrative. But the contemporary portion is to be found in the *Gesta Annalia*, the materials for the later books not at all in the part which the author lived to put into shape. In the parts which concern England, Fordun largely copies William of Malmesbury, as far as William of Malmesbury takes him. But he also gives a good many details of eleventh and twelfth century history from other sources, about which we should often be glad to know what those sources were. Thus we have in William of Malmesbury a short notice of Robert the son of Godwine, the crusading follower of the Ætheling Eadgar. Domesday also helps us to the name of Godwine as a tenant of Eadgar, and so helps to confirm William of Malmesbury's story, which indeed there is no reason to doubt. But in Fordun we get long stories about both Godwine and his son; how in the days of William Rufus, Eadgar was accused of treason by a certain Ordgar, "*miles degener Anglicus*," and how Godwine proved the innocence of his lord by wager of battle. Then we get a long account of the exploits of Robert, who is made to be the chief man in that expedition, nominally under the command of the Ætheling Eadgar, by which

* *Johannis de Fordun Chronica Gentis Scottorum*. Edited by William F. Skene. Edinburgh: Edmonston & Douglas. 1871.

John of Fordun's Chronicle of the Scottish Nation. Translated from the Latin Text by Felix J. H. Skene. Edited by William F. Skene. Edinburgh: Edmonston & Douglas. 1872.

the younger Eadgar was set on the Scottish throne. All this, allowing for a little colouring in the details, is likely enough as regards the main facts. It contradicts nothing, and falls in with the very few notices which we have elsewhere of the two persons concerned. And the story has an interest of its own, because Godwine and Robert are typical men, representing the class of Englishmen who adopted Norman ways and took up Norman names. Had Robert simply appeared as Robert without the addition of "filius Godwini," he would certainly have been taken for a Norman or other stranger. But, just because the tale has a special interest, just because there is no reason to doubt its main outline, we should all the more like to know where John Fordun found his details.

The time of Edward the First is described by Fordun in a way intermediate between the true story and the wild inventions of the rhyming chroniclers. Fordun knew perfectly well that King Robert Bruce was not his own grandfather, thereby showing more accurate knowledge of genealogy than his contemporary Barbour. But he does not scruple to say that the crown was first adjudged to the elder Robert Bruce as his lawful right, and that it was only because he refused to do homage for the crown that it was given to John Baliol. Fordun's account of the surrender of William Wallace is curiously ambiguous. His words are:—"Willelmus Wallace per Johannem de Meneth fraudulenter et proditoriater capitur, regi Anglie traditur." This is literally true. William Wallace was seized "per Johannem de Meneth" in the discharge of his official duty; but the act was undoubtedly "fraudulenter et proditoriater" on the part of Jack Short. Yet by any one who only knows the common fable the words of Fordun would certainly be taken as asserting it.

Of Mr. Skene's two volumes, the first contains the preface in the Latin text with some pieces in an appendix, among which is Æthelred of Rivaux's account of the Battle of the Standard. The second volume contains an English translation and Mr. Skene's notes. At the end of these last is an essay on "Tribal Communities in Scotland and the Early Tenure of Land" there, which is of importance just now, when so much light is being thrown from various quarters on the early tenure of land in various parts of the world.

THINGS A LADY WOULD LIKE TO KNOW.*

IN the anxious and simple-minded little heroine of *A Very Young Couple*—one of the best of the novelettes of last Christmas—we may recognize the ideal of the lady who would like to know the things which are written in this book. She would subscribe to the author's introductory extracts from the "inspired words of the wisest of men" in praise of the virtuous woman; and would agree with the conviction expressed in the preface that "our future is in the hands of woman," notwithstanding a secret sense of her own deficiency in the arts of catering and account-keeping. According to Hannah More, "there is no surer test of integrity than a well-proportioned expenditure"; and the little lady who spent the sovereign given to her by her husband for the purchase of the materials of a dinner on bottles of strawberries, green peas, new potatoes, radishes, curry powder, and French plums, without so much as a thought about the meat which these were to garnish, would see a royal road to the dignities of honest and helpful housewifery in a red-and-gold-covered manual four-fifths of which are taken up with hints how to furnish neat little dinners for every day in the year, to say nothing of such feats of culinary legerdemain as making the roast leg of mutton of to-day appear to-morrow in the disguise of fried allerles (query "rissoles"), and the next day's roast turkey come on again the day after as "a mole made of the remains of the turkey."

After this conjecture as to the type of lady with whom the volume before us is likely to be in demand, it may be well to ascertain the scope and views of the author or compiler who undertakes to supply "the things a lady would like to know." Mr. Southgate has evidently saturated his mind with a course of sermons and moral essays designed especially for the ear of the softer sex; and, starting with a quotation to the effect that it is "the glory of womanhood to elevate meat, drink, and household cares into something transfigured and sublime by the spirit in which she ministers them," he has set himself to ransack "treatises on the subject of making the management of domestic affairs easy and interesting"; and "to the suggestions these have supplied he has added what occurs to him from his own experience and observation." The practical result is that, out of a total of 537 pages, 450 relate to cooking and kindred matters, the small residue being devoted to a prelude of quotations expressive of what good men have thought of women, and to hints on travelling, dress, deportment, gardening, prayers, and so on. The most valuable part of the book is to be found in the recipes which Mr. Southgate has compiled from others, his original matter being easily discernible by an absurd turgidity of style, as where he says of tight boots that "they check the circulation of the pedal blood, make the feet cold, and sometimes aid in chilblaining them"; and of tight corsets, that "they dapple the cheek with unsightly blotches, convert its fine cuticle into a motley scarf, blur the eyes, discolour the teeth, and tip the nose with cranberry red." Nor, whilst on the subject of what is original and what is

borrowed matter in the pages before us, can we forbear pointing out that "the Suggestions to those who give Dinner Parties" and the "Hints on Travelling" are taken wholesale and without acknowledgment from Walker's *Original*, which, as luck will have it, has only just been republished. Elsewhere, amongst hints for conduct, two short quotations are credited to Thomas Walker, M.A.; but the omission to ascribe to him the two larger essays we have named must be attributed either to carelessness or disingenuousness. We are willing to leave Mr. Southgate on the former horn, because in the "suggestions" which he has introduced as a preface to party dinners, the advice (of Mr. Walker) to do away with centre-pieces and have a basket of beautiful bread, white and brown, in the middle of the table, with a silver fork on each side so that the guests may help themselves, is in curious contradiction to the compiler's own previous prescription of a centre-piece filled with fruit, flowers, or bombons for the decoration of the table in each month of the year. It is an error in judgment of another and a lesser kind to cull (in this case with acknowledgment) the hints on the garden and gardening from the shilling manual of Messrs. Jones, Carter, and Co., which the readers of *Things a Lady would Like to Know* might be trusted to consult at first-hand, unless indeed there is a "transfiguring and subliming" process in transference into a seven-and-sixpenny volume.

As we have already said, the bulk of the book is made up of directions as to these very vital considerations of meat and drink, breakfasting, dining, and supping, which, tacitly at least, are assumed to be the things a lady would chiefly like to know, because apparently a knowledge of them is the surest way to the heart and affections of her lord. And, because we presume there lurks in meat and drink—however and by whomsoever spiritualized—just a little suspicion of animalism, Mr. Southgate has hit upon the device of refining and sublimating the details of his "dinners arranged for every day in the year" by placing a poetic or quasi-poetic motto or quotation over each "bill of fare" as it comes round. The extracts, however, are by no means happily chosen. What connexion, for example, can be divined between the heading of the bill of fare for February 18—

The girl whom benevolence warms
Is an angel who lives but to bless.—BLOOMFIELD—

and the "stewed eels, grilled bones, Turkish pilaw, potatoes, and custard pudding," which it introduces? Or, again, what are we to think of the juxtaposition of this admirable advice from Shakespeare—

The friends thou hast, and their adoption tried,
Grapple them to thy soul with hooks of steel;
But do not dull thy palm with entertainment
Of each new-hatched and unfledged comrade—

with a carte made up of "boiled salmon, lobster sauce, beef kidneys, vegetables, and ground-rice pudding"? It is hard to say whether the entertainment so heralded and so composed is meant for a "tried" or an unfledged ally. The boiled salmon and lobster sauce might bespeak the former, but the beef kidneys and ground-rice pudding, *sans* alternative of any kind, are a problem we cannot profess to solve. No doubt Mr. Southgate may rejoine that there is no connexion between the motto, which is simply a word of encouragement to his lady readers, and the carte, which is a list of the "coarse and common things" they have daily to refine. But are we to disabuse our minds of the impression that, in the carte for February 22, which is as follows—

Against diseases here the strongest fence
Is the defensive virtue, abstinence.—HEMLOCK.

- | | |
|----------------------------|---------------------|
| 1. Herrings. | 3. Mashed Potatoes. |
| 2. Rabbit à la Jardinière. | 4. College Pudding— |

motto and menu do not alike represent a *maigre-day*; or that, in that for April 8 (p. 116)—

It is astonishing how little one feels poverty when one loves.
BULWER LYTTON.

- | | |
|--------------------|-------------------------|
| 1. Stewed Lobster. | 3. Vegetables. |
| 2. Olla Podrida. | 4. Ground Rice Pudding— |

the author does not mean to suggest a teaching little consolation to the principal characters in "Love in a Cottage"? The coincidence of the motto for February 9, "Use no hurtful deceit," &c. &c., with the first item of the carte, "Mock Turtle Soup," is perhaps accidental. Before, however, we quit the subject of these mottoes, on which perhaps enough has been said, it may not be out of place to remark that Mr. Southgate is more at fault than one should have expected so practised a compiler to be when he labels as "anonymous" the familiar lines of Keble's Evening Hymn which begin "We need not bid for cloistered cell"; and that he takes a liberty with Tennyson when he thus winds up the last stanza of "Lady Clara Vere de Vere"—

Pray heaven for a human heart,
And let your selfish sorrow go.

The Laureate would hardly thank him for his alliterative emendation of the words "foolish yeoman."

It would be strange if, in so thick a volume and amidst such a variety of topics, the author should have failed to recall anything worth knowing. It was perhaps hardly worth while, however, to record such elementary truths as that "the best meat and the prime joints are cheapest in the end" and that "stews should never be suffered to boil." Upon such a statement as that "Crimped Gloucester salmon is plentiful in June and part of July, but it may be procured almost all the year round" (24) one cannot help remarking that the latter part of it is

* *Things a Lady would Like to Know.* By Henry Southgate, Author of "Many Thoughts of Many Minds." London and Edinburgh: W. P. Nimmo. 1874.

singularly vague, and that we imagine the Conservators and Fishery Boards of the Severn would have something to say to it; and when the author speaks, in p. 128, of cherries and strawberries as in season in May and of green apricots as in season at any time, we surmise that he dwells in a country where fruits mature very early. The daily bills of fare are wonderfully free from sameness, and where familiar dishes come round again in the course of weeks and months, we are bound to say there is generally something new and worth knowing in the recipes for cooking them. In p. 174 is a good idea "to dip a roasted leg of lamb upon a bank of spinach." In p. 266 "Boiled ducks" are a novelty, and perhaps a good one. They should be salted two days, then slowly boiled in a cloth, and served in onion sauce in the preparation of which milk is used instead of water. Oyster fritters (p. 283) is another good idea; and another October dish, stewed pheasant, is none the worse for having something more than a soupçon of oysters about it. "Wrexham soup" (p. 184) may be recommended to those who like a good hotch-potch of vegetables; but we had rather stick to the old plan of serving asparagus. Cut from a good country bed, the cabbage part is nearer the whole than the half, and the lack of tongs need not drive us to the new fashion. In p. 214 a hint is given with a great flourish of trumpets, which consists in a recommendation to drink claret after salmon in order to realize the true flavour of the wine. Most people will probably be disposed to stick to hock. We have no fault to find with the "party dinners," the bills of fare for these being conceived in a liberal spirit, which does not in all cases characterize the every-day entries that precede them. About breakfasts and tea, also, Mr. Southgate entertains sound views, though, in the desire to prescribe light suppers, his first suggestion is "Roast lamb." We trust they may lie heavy on the chests of those who act upon his advice.

Amongst the other matters discussed we have no intention of noticing "the Hints for the Angels of our Households," on "Prayer, &c.," which strike us as singularly out of place in what is, in point of fact, a cookery book. The suggestions as to dress and toilet include two or three which are perhaps rather to be wondered at than imitated—e.g., where, in p. 487, this direction is given: "To clean the teeth. Rub your brush in the soap you use, and lather your teeth well." With this may be compared a recipe in p. 484:—"To prevent the hair from falling off. Sponge the hair lightly every day with cold tea." Had this latter recipe been given with the elegant minuteness of the former we should not have been surprised at the addition of a rider: "in the soap-basin." If we have not already said enough to show our estimate of this made-up book, we must content ourselves with a general conclusion—that in the culinary department of it, where the author seems to be really at home, his oracles may possibly be of some service, but that in all else his information is at best second-hand, and in much (as where he gives "*rannunculus arvens*" as the Latin name for "crow-foot") inaccurate.

LOWER'S WAYSIDE NOTES IN SCANDINAVIA.*

MR. LOWER'S style of writing is not faultless, and the matter of his volume might be far better than it is and yet not be good. He entreates his countrymen, instead of hurrying to the hackneyed banks of the Rhine, "to go to Scandinavia and spend two or three months, say in May, June, and July, in those pleasant hospitable countries." It is to be hoped that such as may take his advice may not feel themselves bound to follow his example by writing books like Mr. Lower's, or by writing any books at all. Mr. Lower is no sportsman, and his health was not strong enough to allow him to do more than see a few cities, and make some excursions in carriages to places easy of access. He went nowhere, in short, where the traveller would not find a sufficient guide in "Murray," and from "Murray" he seems to have gathered no small part of the matter with which he has filled his scanty pages. The matter so borrowed has not gained by the process. Mr. Lower's attempts at sprightliness only bring out more prominently the dullness and monotony of his writing; nor can we wonder if the reader closes the book with the impression that, if nothing more be needed, the duties of authorship are easily discharged.

Mr. Lower does not tell us precisely how far his travels were extended. He left London in July of last year, and his sojourn was cut short by renewed illness, seemingly, not many weeks later. During this time he saw a little of Denmark, Sweden, and Norway; but his volume is practically taken up with describing the sights of Copenhagen. His acquaintance with the history of those countries, and with their antiquities, we need not question; but if it be asked whether his book contains much that is both true and new, the answer must be in the negative. The poverty of his matter is not relieved by the frequent jauntiness of his manner, and by an affectation of simplicity not altogether in harmony with his ordinary modes of expression. With Elsinore or Helsingør he confesses himself disappointed, not on account of any supposed insignificance or repulsiveness in the place, but because he found no trace of Hamlet there. The stream in the Marienlyst garden was not deep enough, he thinks, to allow Ophelia to drown herself in it; and hence Elsinore was to him (why, we cannot comprehend) "the play of Hamlet with the part of Hamlet left out." No sooner is he landed in Scan-

dinavia than he proceeds "to remind the gentle reader of a few historical and geographical facts which may have escaped his recollection." These facts the reader may for the most part find in ordinary treatises on the history or geography of Northern Europe; and Mr. Lower, conscious that the plan which he seeks to carry out may be set aside as rather dull, does what he can to enliven it by skipping from one country to another, and hurrying from mountains and lakes to Parliaments, and back again. From a sketch of Danish history we are carried off to the Dovrefjelds of Norway, and thence are brought back to the Danish "Thing," of which he is scandalized to find that peasants, mechanics, and butchers may be members. Some remarks on these legislators are immediately followed by a list of the birds and beasts killed in Norway in 1855, and by an account of the migrations of the lemming. Having spent nearly half his book in describing, or, as he puts it, in rehearsing, the beautiful works of art at Copenhagen, he hastens to give a Norwegian legend, and then runs back to the cities and palaces of Denmark. Like other men who write rather because they wish to say something than because they have something to say, he looks with favour on digressions, as devices for producing variety, and resorts to them without much scruple.

If we are told little about mountains and streams or the amusements and occupations to be found among them, we have some experiences of an invalid, which may possibly tempt others in the like case to brave the hardships of a voyage to the Baltic. Confined to his bed for a day or two by an attack of illness, the author is visited by a lady who sits for half an hour holding his hand in hers all the time, and "talking in a manner calculated to cheer an invalid's heart." "On another occasion," we are told, "my wife and myself visited several newly-made lady friends, and I kissed six of them without a blush among the eight of us! I don't believe there is a coquette in all Scandinavia." The conclusion is consolatory. Not less pleasant is it to learn that the Danish peasantry have not lost the good manners which seem to be fading away in England. "They are mostly clean and decently habited. When they meet a superior, they salute him by raising their caps, and they do the same to persons of their own position, if known to them."

Shut out by illness from more active tasks, Mr. Lower was driven to spend his time chiefly in museums, the contents of some of which are in great part catalogued. The remarks appended to some have, indeed, much the look of peddling. Among the works of Thierwaldsen is a Cupid complaining to his mother of the sting of a bee; and a page is filled with the whole ode of Anacreon, in which he thinks that the tale is "well told," and with a part of an English version of the ode, which is all that he can remember of it. The reader is bidden to mark the moral, which is "that Venus says to Cupid, 'You ought not to complain of the sting of a bee, when you have wounded so many hearts with your own winged arrow.' If we have the moral at all, it would be well to have it as it is. When some men in the army of Mahomet spoke of the heat of the day, the prophet reminded them of another place where the weather was hotter. In the ode of Anacreon Aphrodite simply bids Eros measure from his own pain the much greater pain which he causes to his victims. But, to use a phrase of which Mr. Lower seems to be fond, we may let this pass, and turn to his remarks on Scandinavian history. If these are not profound, they are thrown off with a patronizing air which some persons may find amusing in leisure moments. Having praised the behaviour of the victor at Stamford Bridge, he adds:—"Poor Harold, the son of Godwin, only three weeks later was slain at the battle of Hastings by the followers of William the Conqueror." It may be said that books should be both written and read without much trouble. Certainly it is no laborious task to tell us that "after the Thirty Years' War Sweden was so raised in the scale of nations that from an obscure State it came to be considered one of the first of European Powers." But the reflections made on Swedish or other history are not always consistent, even when they are found in consecutive pages. After the days of Gustavus, Sweden, he remarks, "was again reduced to its original and normal condition," the conclusion being that "there never was since the world began so wretched a country as this, and its history ought to be written in letters of blood." This proposition, which implies a somewhat wide range of historical knowledge, is a little modified in the next page, in which we are told that "clouds have for the most part pervaded its political atmosphere, but they have been happily atoned for by the most glorious bursts of sunshine that this changeful world has ever witnessed."

Mr. Lower has also something to tell us on the languages of Denmark, Sweden, and Norway. Their general likeness is a strong proof of the common origin of the inhabitants. Candidly avowing his ignorance of these languages, and thinking that many have been "deterred from getting at least a smattering of them by the repulsive Gothic characters resembling those of the German," he gives a few specimens in proof of their close affinity. Among these are rightly enough the numerals and the names of days of the week; but these are followed, not by lists of pronouns or modes of inflexion, but by the names of the months, in utter unconscientiousness seemingly that these are neither English, Danish, nor Swedish. He also made the discovery that "there is the like similarity in conversational phrases, 'good morning' being in Norwegian *god morgen*, while 'good evening' is represented by *god aften*." For "further information" on languages which he does not profess to understand he refers his reader "to the instructive pages of our friend of Albemarle Street," contenting himself with the

* *Way-side Notes in Scandinavia*, by Mark Antony Lower, M.A., F.S.A., &c. London: Henry S. King & Co. 1874.

remark that "we are in want of a book which might be called the 'Common Origin of Nations,' to show how all mankind have sprung from one stock." Certainly a book which should succeed in showing this would go to the root of the matter; but until it is written, Mr. Lower may read a good many written in support of his proposition and not a few which call it into question.

In truth, it is not easy to see what good purpose is answered by the desultory, superficial, and rambling talk which for the most part fills the pages of this book. Such talk of course leads to blundering, while it generally misses the points to be noticed. Mr. Lower marvels "that the people of one country cannot pronounce the local names of another. The French persist in calling our metropolis *Londres*. . . . And we are perhaps as much in fault as others, for we call Helsingor *Elsinore*, and Kjøbenhavn *Copenhagen*." It might be more instructive to point out the true English form of the name Copenhagen in our town of Chippenham. As an account of the countries visited, the book has no value whatever. It may be of some use to those who visit the Museum of Thorwaldsen (which, they are here told, is "one of the greatest educational establishments in the world," giving "a healthy tone of thought to both rich and poor"), as well as to those who may go through the Museum of Northern Antiquities. They will find in Mr. Lower's volume some remarks on Professor Engelhardt's Catalogue and on a large number of the objects classified in it. They will read something about Rune stones, and something about sagas and chronicles which are not much to be trusted; and if they desire nothing more than what is here put before them, they will be easily contented. Mr. Lower praises the letterpress of this Catalogue, with its illustrations, as among the best that he has ever seen. "If my volume," he adds, "should ever be reprinted in Scandinavia, I hope that it will issue from the 'Imprimerie de Thiele.' We hope that no such misfortune may befall him. It is a pity that his book should be read in English; it would but make the matter worse to allow it to be read in another tongue.

MORTOMLEY'S ESTATE.*

IT is scarcely fair to the ordinary reviewer to publish such a book as *Mortomley's Estate*. Familiar though he is with all the regular crimes, and hand in glove though he has been kept through a long course of reading with the worst criminals, he still does not profess to have any exact knowledge of the working of the Bankruptcy Act of 1869. Mrs. Riddell says that "he who goes into liquidation without first being sure of his trustee, his lawyer, and his committee, passes into an earthly hell, over the portals of which are engraved the same words as those surmounting Dante's *Inferno*." This may be all true. If, however, three long volumes are required to set it forth to the public, it is rather the services of an attorney than of a literary critic that are required to draw up a brief statement or review of her case. There have been stories, far too many indeed, in which writers have tried to combine amendment of the law with amusement of the public. We had never seen, however, till we came upon the volumes now before us, a novel in which the author was so carried away by hatred of the law as to forget altogether that the reader possibly might like to be amused. It would scarcely be too much to say that the hero of the story is the Bankruptcy Act of 1869, and the heroine, winding up an estate by liquidation. We would not be understood to mean that there are no characters in the story. The author, however much she might have wished to represent a Bankruptcy Act abstractedly, yet by the very nature of the case was unfortunately bound to introduce a few people. There is a bankrupt's wife who dies in the very last chapter, and a City gentleman who earlier in the story avoids bankruptcy by poisoning himself off. It is easy to see, however, that such people as these are introduced, not as studies of character, but as a kind of framework, if we may use the expression, on which a law may be gibbeted. The law may be a bad one—with that at present we have nothing to do—but Mrs. Riddell's story is, we should imagine, in its way a good deal worse. A long story like this, where the author from beginning to end harps on one string, reminds us of nothing so much as the furrows that are ploughed in California. There you may see a man starting with a fresh team of horses whose sole task for that day will be to drive one furrow in a field that is nearly twenty miles broad. We are in one point only, but that an important one, happier than he. When we had reached the last chapter of the last volume, utterly weary though we were, we felt nevertheless that it would be a long time before we should have so tedious a journey to travel again. It is only a very long Act of Parliament that could afford matter enough for so long a tale, and long Acts happily are not passed every Session. If ever the Merchant Shipping Act gets through, then we shall expect a romantic treatise on it equalling in length and in dulness *Mortomley's Estate*. But for the next few Sessions we are, we conceive, safe.

Mrs. Riddell is as severe upon the men of business of the present day as she is upon the Bankruptcy Act. She talks in one place of "a few honest men in the City—a few of the typical ten who may yet save it, if indeed there are—almsgiving notwithstanding—ten left." She writes of

the days when England and Englishmen cared for something beyond sale

and barter; when they laid down their lives for the sake of King, Country, Religion; and entertained grand ideas on the subject of Loyalty, Patriotism, and Courage, which pounds, shillings, and pence, the yard measure, and the modern god Commerce have long since elbowed out of court.

May we not expect to find the City men in their turn talking of the days when England and Englishwomen cared for something beyond writing nonsense and selling it; when they spent their lives in making wholesome puddings instead of foolish books, and entertained sensible ideas on the subject of domestic life and woman's work, which extravagant speculations, "sensationalism," and the modern god Excitement have long since elbowed out of court. The one reproach would be as much, or as little, deserved as the other. It is scarcely possible that any woman can know much of the way in which business is carried on in the City. It is altogether impossible for a woman who has spent her time in writing novels. We place but little credit in the charges that are made against whole classes of men. When we see dirt thrown round on all sides, though we know that some no doubt will stick, yet we have no reason to believe that any is fairly aimed. Wherever men are gathered together there are rascals to be found. We have no belief in that golden age of commerce of which those seem to know most who have read history least. When once we begin to trace back the course of time and to fix the age of this blessed innocency, we have to confess that it,

Like the circle bounding earth and skies,
Allures from far, yet, as we follow, dies.

The novel-writers, and among them the women not least, surely are far more open than the men of business to the reproach that they have fallen away from a state of comparative innocence. *Mortomley's Estate* certainly is not in any way exposed, like the works of so many of our modern female writers, to the charge of immorality. Yet it is a book which could not have been written by either man or woman half a century ago. The race to which it belongs had not come into being then. That strange tongue which novelists now delight in, that mixture of the finest words and the vulgarest slang, was unknown. There were sentimental absurdities enough in the books of those days no doubt, but where in a writer of any name will any one find phrases that can be at all matched with those which lie scattered through Mrs. Riddell's novels? We will string a few of them together, taking them as they come. We read there of "a race of men eliminated from monkeys"; "anguished tears"; "impending bankruptcies"; "a business in which he saw there lay, to quote his own mental phrase, something so 'fishy' as the conjunction of Kleinwort, Werner, and Forde"; "set down her foot upon a sentence"; "the loan of the name has been manipulated"; "Mortomley vibrating between office and works"; "italicizing the observation with a wink"; "of all the rot that ever I saw"; "strident tones"; "so supreme an idiot"; "wealth of flowers," "wealth of foliage"; "beastly dark hole," "beastly English brute"; "a feasibility about his statements stamped them to her mind with a certain authenticity"; "he moaned about the premises"; "these ebullitions were all so many safety valves"; "if timid people elect to walk along Lower Thames Street"; "he elected to seek a change in Leicestershire"; "he elected to have his chair wheeled up close to the side of the window"; and "he elected that Mr. Asherill's perfect gentleman should fill the post of liquidator." It is not merely phrases here and there, it is whole passages that are written in the same foolish language. In one page we read, "Hearing that Mr. Swanland turned from the window, where, in a make-believe convivial fashion, he had been conversing with himself and his liver, and said, 'Shut up!'" and in another, "Pedigree is one of those intangible and incontrovertible commodities which never commands (*sic*) a premium in the busy, bustling, practical city of London." It seems to us that men of business might with good reason demand that, if they are to be abused, they shall be at least abused in plain grammatical English. A lady novelist should not follow in the steps of O'Connell, nor try to scare City men in much the same way in which he did the fishwife when he told her that she kept an hypocaust in her house.

As for the story of *Mortomley's Estate*, there is no need to say much. A colour manufacturer acts very foolishly, gets involved, goes into liquidation without even consulting his own lawyer, and so affords the finest opening for general abuse of the Bankruptcy Act. But we will quote Mrs. Riddell at some length:

Whether the gentlemen, commercial and legal no doubt, who concocted the Bankruptcy Act of 1869, and the other gentlemen of the Upper and Lower Houses who made it law, ever contemplated that an utterly irresponsible person should be placed in a responsible position it is not for me to say, but I cannot think that any body of men out of Hanwell could have proposed to themselves that the whole future of a bankrupt's life should be made dependent on the choice of a trustee, since it is simple nonsense to suppose a committee selected virtually by him and the petitioning creditor have the slightest voice in the matter.

And if any man in business whose affairs are going at all wrong should happen to read these lines, which unhappily is not at all probable, since literature at such a time chiefly assumes the form of manuscript, let him remember liquidation means no appeal, no chance of ever having justice done him, nor even, remote contingency,—supposing the trustee a cool hand like Mr. Swanland,—of setting himself right with the business world.

Then comes the passage which we have quoted above, where we are told that over the portals of that earthly hell, liquidation, are engraved the same words as those surmounting Dante's *Inferno*. The author goes on to add:—"He has left hope behind. God help him, for nothing save a miracle can ever enable him to retrace the path to the spot where she sits immortal." Happily, in the present story the miracle occurs. There comes a *Deus ex machina*

* *Mortomley's Estate*. A Novel. By Mrs. Riddell, Author of "George Geith," "Too Much Alone," "Home, Sweet Home," "The Earl's Promise," &c. &c. 3 vols. London: Tinsley Brothers, 1874.

Secretary—H. E. PENNY, Esq.

Brokers—Messrs. HUGGINS & CO., 1 Threadneedle Street, London, E.C.

OFFICES:—ROYAL INSURANCE BUILDINGS, BRISTOL.

The Directors of the BRISTOL PORT AND CHANNEL DOCK COMPANY are prepared to receive applications for £93,300 Five per Cent. First Mortgage Perpetual Debenture Stock of the BRISTOL PORT AND CHANNEL DOCK COMPANY, bearing interest at the rate of 5 per cent. per annum, which will be paid in any amount not less than £100.

The entire borrowing powers of the Company are limited by the Act of Parliament to £93,300, constituting a first charge upon the whole of the property and undertaking of the Company.

The price of issue of the Debenture Stock now for subscription is par, or £100 per £100 stock, and payment is to be made as follows:—

5	per cent.	on Application.
20	"	on Allotment.
25	"	on November 1, 1874.
25	"	on December 1, 1874.
25	"	on January 1, 1875.

£100

Interest at the rate of 5 per cent. per annum will accrue on each instalment from the date of payment, but the privilege is reserved to Subscribers to pay up in full on Allotment, whereupon the interest will accrue at once on the full amount subscribed.

The interest will be paid half-yearly at the Banking-house of Messrs. BARNETTS, HOARES, & CO., Lombard Street, London, on January 1 and July 1 in each year, and the first payment will be made on January 1 next.

The BRISTOL PORT AND CHANNEL DOCK COMPANY has been incorporated by Special Act of Parliament for the purpose of providing for the Port of Bristol additional Docks, suitable for ocean-going steamers and other ships of large tonnage.

The Docks, whose property extends to about ninety acres freehold, are situated at the mouth of the River Avon, with direct access from the Severn and the Bristol Channel, and will be easily and safely approached at all seasons, in all weathers, and at almost any state of the tide, by steamers and ships of the large class, for whose accommodation they are specially adapted.

Bristol, as it is well known, was the birthplace of trans-Atlantic steam navigation, its geographical position offering advantages for an ocean steam trade unequalled by those of any other port, on account of the facility of reaching it in a direct line from the Atlantic, free from the dangers of the English and St. George's Channels.

It has been hitherto impossible to turn these natural advantages to full account in consequence of the difficulty of reaching the Old Docks, which can only be approached through the tortuous and dangerous channel of the River Avon, from whose mouth they are about six miles distant.

This difficulty has been found to operate so prejudicially as to render it an absolute necessity to construct Docks suitable for vessels of large tonnage, in a situation more easy of access, and so as to allow the natural capabilities of the port to be fully utilized.

Notwithstanding the great disadvantages under which the trade of Bristol suffers from the want of accommodation for large ships and steamers, the sea-going tonnage has rapidly increased, as follows:—

In 1852	The Foreign Import Tonnage was	132,372 tons.
In 1862	"	262,327 "
In 1872	"	374,188 "
Whilst for the year 1873 the total was		411,014 "

being an increase of nearly 30,000 tons over the previous year.

The progress of the Grain trade at Bristol has during the same period been still more striking, having advanced from 16,648 tons in 1852 to 131,608 tons in 1872, or an increase of nearly nine times.

The tonnage of coasting and other vessels from Ireland, &c., amounted, for the year 1873, to about 595,000 tons.

Coal being probably the most important item in the steam-shipping trade, the Bristol Port and Channel Docks, from their close proximity to the Welsh Coal Ports, will effect for steamers an average saving in freight, insurance, breakage, &c., of

about 6s. 6d. on every ton of Welsh Steam Coal, in comparison with the principal steam ports of the country. On a line of 10 steamers making a weekly departure throughout the year, requiring on an average, say 2,000 tons of coal per week, the saving would amount to over £30,000 per annum.

A reference to the railway map will show the varied and speedy communication now existing between Bristol and the Metropolis, and Bristol and the great manufacturing towns of England.

Recognizing the importance of this undertaking, and with a view to the great traffic which must necessarily result from these Docks on their completion, the Midland Railway Company and the Great Western Railway Company have jointly for some time past been engaged in constructing railways, now nearly completed, to connect the lines of both of those Companies with the Bristol Port and Channel Docks.

By this arrangement the rails will be brought directly on to the Dock quays, and passengers and goods from London, the Midland district, and all parts of the Kingdom will thereby be enabled to be laden and discharged directly to and from the ships into the railway carriages and waggon. The Docks will then be only about three hours' distance from Birmingham, and only little more than three hours from London, a consideration obviously of paramount importance.

To the Midland district, especially the importance of the undertaking cannot be overestimated for economy and convenience in the export and import of goods.

The central position of Bristol offers to the Post Office one of the best points for the collection and distribution of that portion of the Foreign Correspondence of the country which is conveyed by ocean-going steamers.

In view of the early completion of these Docks, arrangements are already in progress, having for object the making of Bristol the port of arrival and departure for lines of ocean steamers trading with Australia, America, and Canada.

The Share Capital of the Company is £295,000, the whole of which has been subscribed.

Upwards of £200,000 have already been expended in the construction of the Docks, which are now approaching completion.

A careful and practical estimate of the revenue to be realized by the proposed Docks shows a net revenue (after deducting all charges and the expenses of working, and also making provision for repairs and maintenance) of £12,230 per annum, which estimate may be taken as not only reliable, but moderate.

The amount required to pay the interest of 5 per cent. per annum on the whole of the £93,300 is only £4,665, whilst the estimated net income is £12,230, being upwards of six times the amount required for such interest.

The Debenture Stock now offered for subscription consequently forms an investment of the highest character, and, as such, is suitable for Bankers, Insurance Companies, and others seeking an English first-class investment.

The current value of Five per Cent. Debenture Stocks of English Docks and Railway Companies is from £118 to £125 per £100 Stock.

Provisional Certificates will be issued in exchange for the Bankers' Receipts, and on completion of the payments the Debenture Stock will be inscribed in the names of the Subscribers, free of Stamp Duty.

In the event of no Allotment being made to any applicant, the Deposit paid will be returned forthwith without deductions; should a smaller amount be allotted than applied for, the balance paid on application will be applied towards payment of the amount payable on Allotment.

Applications on the annexed form, accompanied by a deposit of £5 per cent. on the amount of Debenture Stock applied for, may be sent to Messrs. BARNETTS, HOARES, HANBURY, & LLOYD, Bankers, 60 Lombard Street, London, E.C.; Sir Wm. MILES, Bart., & Co., Bristol, the Bankers of the Company; the Secretary, H. E. PENNY, Esq.; at the Company's Offices, Royal Insurance Buildings, Bristol; or, to Messrs. HUGGINS & CO., Stock Brokers, 1 Threadneedle Street, London, E.C., from whom Forms of Application can be obtained.

By order of the Board,

September 24, 1874.

HENRY E. PENNY, Secretary.

ISSUE OF £93,300 FIVE PER CENT. PERPETUAL DEBENTURE STOCK OF THE

BRISTOL PORT AND CHANNEL DOCK COMPANY,

Incorporated by Act of Parliament, 27 & 28 Vict. cap. 241.

FORM OF APPLICATION (to be retained by the Bankers).

TO THE DIRECTORS OF THE BRISTOL PORT AND CHANNEL DOCK COMPANY.

GENTLEMEN:—Having paid to your credit at your Bankers the Sum of

Five per Cent. Perpetual Debenture Stock of THE BRISTOL PORT AND CHANNEL DOCK COMPANY, I request you to cause that amount of Stock to be allotted to me, and I hereby agree to accept the same, or any less amount, and to pay the balance in respect of such Stock according to the terms of the Prospectus dated September 21, 1874.

Name in full
 Address
 Profession (if any)
 Date 1874.
 Signature

(Addition to be filled up if the Applicant wishes to pay up in full.)

I desire to pay up my Subscription in full on Allotment, receiving interest thereon from the date of payment.

Signature

ISSUE OF £93,300 FIVE PER CENT. PERPETUAL DEBENTURE STOCK OF THE BRISTOL PORT AND CHANNEL DOCK COMPANY.

CLOSING OF THE LISTS.—NOTICE IS HEREBY GIVEN, that the LISTS OF SUBSCRIPTION for the above will be CLOSED on Tuesday next, the 13th instant, for London applications, and on Wednesday next, the 14th instant, at Twelve o'clock, for Country applications.

THE SPANISH NOTE.

THE Note addressed by the Spanish Minister to the French Government derives importance, not from the specific allegations which it contains, but from the fact that it has been deliberately presented. It is now evident that Marshal MACMAHON and Count CHAUDORDY were fully justified in the coldness of the language in which their diplomatic recognition was conveyed. The tone of the Spanish Note is neither explained nor excused by the previous communication in which the Duke DE CAZIS had asked for particulars of alleged violations of neutrality. It was unnecessary to comply in detail with a formal demand, or to refer to instances of negligence which may have been committed two or three years ago. Above all, it was unbecomingly and unfriendly to address reproaches to a Government which had within a few days consented, with some sacrifice of national feeling, to follow the lead of Germany in recognizing Spain. The form of address which was adopted by the French Minister in concert with his English colleague was more proper and more respectful than the personal title by which alone the German and Austrian representatives addressed the head of the Government. A recognition accorded to the Duke of LA TORRE might be withdrawn or withheld at pleasure from any successor to his office. Mr. LAYARD and Count CHAUDORDY were accredited to the Chief of the Executive Power, who probably may himself have preferred the omission of any notice of the Republic. The formal address of the French Minister was not discourteous, though it may have been dry; and it is remarkable that Mr. LAYARD'S more effusive expressions of friendship have formed the subject of spiteful comment in the journal which is supposed to express the policy of the Spanish Government. The hope that the national feeling would find free utterance is represented as an impertinence on the part of a foreigner; and the official writer even indulges in wild speculations of an alliance to be formed by England, France, and Russia against Spain. It is not surprising that political speculators should amuse themselves with conjectures of the share which Prince BISMARCK may have had in the Spanish remonstrance. If it were the object of Germany to inflict useless annoyance on France, an affront offered to the Government of Marshal MACMAHON by the most helpless State in Europe would perhaps be welcome at Berlin. Prince BISMARCK is incapable of seeking indirectly to insult a neighbour whom he has no present purpose or opportunity of injuring.

The irritation which a Government engaged in civil war feels against a neutral who is supposed to favour the insurgents may be readily understood and forgiven. The French, indeed, have more than once stated in answer to similar complaints that a larger proportion of warlike stores is introduced into Spain by sea than by land; and it may easily be believed that English adventurers are active wherever money is to be made. The Spanish naval officers are suspected of disaffection, and their vigilance is undoubtedly imperfect. It is not the duty of French cruisers to intercept vessels laden with arms or ammunition in Spanish waters; and smugglers know that whenever the weather becomes rough the harbours on the Northern coast will be left unwatched by the Spanish squadron. Marshal SERRANO and his Ministers would probably reply that they are well assured of the friendly disposition of the English Government, and that it has no means of preventing a contraband trade on the coast of Spain. The French are close at hand, and it is notorious that a large part of the border population, including some official persons,

favour the cause of the Carlists. One of the allegations in the Spanish Note might have been almost understood as an excuse for the French authorities. It is asserted that many of the small-arms which remained in the hands of private persons after the German war have found their way across the frontier. As an interval of more than three years has elapsed since the disbandment of the Free Corps and the Mobile Guards, the traffic in muskets clandestinely retained by irregular levies has probably long since ceased. The long line of the Pyrenees, with their numerous passes, is almost as favourable to illicit traffic as the Northern coast. It is not pretended that any arms have passed from the possession of the French Government into the hands of the Carlists. When the Fenian conspirators on more than one occasion attempted to invade Canada, they were allowed by the local authorities to break open public arsenals for the purpose of procuring arms; yet the English Government prudently abstained from preferring complaints which would not have procured redress.

The impolicy of the Spanish remonstrance is not less conspicuous than the want of courteous consideration which it displays. If the French FOREIGN MINISTER thinks fit simply to refuse any explanation in answer to a peremptory demand, Marshal SERRANO must submit in silence to a merited rebuff. It is hardly probable that he would be guilty of the imprudence of recalling his Minister from Paris immediately after he has with difficulty secured a long-delayed recognition. Any menace of retaliation or reprisal would be absurd and impossible. Notwithstanding recent losses and humiliations, France is as far superior in power to Spain at the present moment as in the palmiest days of the Empire. The Government of Madrid, which is unable to cope with a comparatively insignificant rebellion, has no force to spare for a foreign quarrel. Even if war between France and Germany were as imminent as it is remote and improbable, the French Government would be a more formidable enemy to Spain than the greatest Power at a distance. A French army could march almost without opposition, as in the days of the Duke of ANGOULÊME, from Bayonne to Cadiz. At present there is no ground of quarrel between France and Germany; and both nations need repose. If the Spaniards were so unwise as to provoke the hostility of their powerful neighbour, they would have to bear the consequences. In such a contest all parties in France would for once be united, for the supposed dependence of Spain on German support has rendered the Republicans almost as favourable as the Legitimists to the cause of DON CARLOS. Marshal MACMAHON'S Government might formerly have been blamed for employing on the Southern frontier Prefects and other functionaries of Royalist sympathies. But the formal demand of Spain for a change in the local administration will be resented as an inadmissible attempt at dictation. It is for the French Government to determine the method by which satisfaction may, if necessary, be given to Spain. The suggestion that one or more Prefects shall be dismissed will be deemed an unwarrantable intrusion. If the French Government desires popularity, it has only to hint that it is thwarting a German intrigue.

In inviting a dispute the Spanish Government probably relies rather on its weakness than on its strength. France will give the Carlists no direct assistance, though a diminution of the limited good will which has hitherto been exhibited by the officials on the frontier might have inconspicuous results. The external action of a weak Government, being admitted as a domestic explanation. Marshal

SERRANO or Señor SAGASTA may perhaps have hoped to revive by an appeal to national feeling the popularity which has of late sensibly diminished. When SERRANO returned to Madrid after the relief of Bilbao, in which he had ostensibly shared, strong hopes were entertained that the insurrection was at last tending to a close. The defeat and death of CONCHA before Estella was a severe disappointment; and the loss has never been retrieved. Since that time several checks have been experienced, and no considerable success has been achieved. It is alleged that SERRANO appointed LASERNA to the chief command in the North through jealousy of MORIONES. It is certain that the slackness of one or both of the generals prevented the recovery of Estella, and partially defeated the attempt to retake Pampeluna. The Carlists on their part are weaker and not less divided, but the prolongation of the struggle excites just dissatisfaction. There are unemployed generals in Spain who may reasonably think themselves equal or superior in capacity to SERRANO, who earned his early promotion nearly forty years ago by services which were not of a military nature. PAVIA, who established the present Government, is no longer engaged in active service; and perhaps MORIONES might command the suffrages of the army. It is also probable that civilian candidates for power would be not unwilling to undermine the supremacy of SAGASTA. The Republicans who a year ago governed Spain without resistance have apparently subsided into inaction and obscurity. If there is any public opinion left in Spain, it may perhaps be temporarily stimulated and gratified by the spirited language of the Note which has been addressed to the French Government. As a diplomatic measure, the communication is an unqualified blunder. If France bears ill will to the Spanish Republic, an excuse for unfriendly conduct will render apologies unnecessary.

CURRENT POLITICS.

SIR WILFRID LAWSON has been addressing his friends of the United Kingdom Alliance at Manchester in a vein not only of cheerful equanimity but of the highest good spirits. The times are, he thinks, bright and sunshiny. One great difficulty that used to beset him has vanished. It used to be objected to him that he and those who supported him were smashing the Liberal party, but this objection, at any rate, cannot now be urged. He cannot smash the Liberal party, for the Liberal party is smashed. It is altogether done for, gone out of sight, dead and buried. Mr. JACOB BRIGHT, than whom Sir WILFRID LAWSON could not wish a higher authority, has publicly stated that the Liberal party has no programme. The ground is therefore quite clear for Sir WILFRID LAWSON, and he feels so very happy. He contrasts his rising star with the palling lustre of Mr. GLADSTONE's fortunes. The late PRIME MINISTER came back from the elections with a large majority turned into a large minority, but Sir WILFRID LAWSON positively gained by the elections. He now commands two more supporters than he could boast of in the last Parliament. Last Session ninety-two members voted for the Permissive Bill, and the way is clear before this gallant band and their chief. With this splendid opening, with the consciousness of growing strength to cheer them, with no political obstacles to hamper them, what are they to do? Sir WILFRID LAWSON puts their one duty and aim unmistakably before them. They are to unfurl a moral flag. This is a proud, a noble—and, it may be added, not a dangerous—thing to do, and it shall be done bravely and resolutely. They can shake their banner in the face of vice, and what will be the effect? Why, as their chief justly says, every one who likes to see a banner so shaken will enjoy the spectacle. It makes no matter from this point of view that a minority of ninety-two is not at all likely to pass the Permissive Bill, or that the Permissive Bill is open, even in the judgment of many who vote for it, to serious, if not insuperable, objections. As Sir WILFRID LAWSON points out, people who support the Permissive Bill are not pledged to any details. They may even think that the Bill would be a very bad Bill if carried. The goodness or badness of a particular measure is perfectly immaterial. The great thing is to unfurl the flag, to let it be known that there are high-minded men who object to drunkenness and who dare to oppose the publicans. Only suppose, as Sir WILFRID LAWSON urged, that the United Kingdom Alliance did not go on waving its banner, how

triumphant the publicans would be! This shows that it must be wise and right to wave the flag; and then waving a flag is a comforting process to those who wave it, and saves a world of trouble. When the Permissive Bill is held up on high by its author, not as a scheme of practical legislation, but as a symbol of disgust at other people intoxicating themselves, this spares its supporters all the wearisome work of thinking how it could be carried, how it would work, what good it would do, whether it would do more good or harm. Nor is it only those who support the Permissive Bill who will gain by having the true significance of the measure explained to them. Those who oppose it will be equally relieved. There can be no call to argue seriously against a Bill which is recognized as being nothing but a banner; we at once escape from considering all the inherent difficulties of the measure, the tyranny of local majorities, the precedent of the United States, and so forth. This is not, as we now know, the right way to look at the Bill. What is called the Permissive Bill is really a Bill for allowing every decent Englishman to declare solemnly that he heartily desires to see his neighbours sober. If this is thoroughly understood, we do not see why Sir WILFRID LAWSON should not look forward to a splendid success, and why his minority should not grow much more rapidly towards a majority than that of Mr. GLADSTONE.

Mr. STANSFELD also has taken to unfurling his moral flag, and is waving the reddest flag he can find in the face of those who support the Contagious Diseases Acts. He considers it a good thing to make these Acts the subject of popular discussion. He admires the ladies who go about lecturing on one of the most disgusting subjects that could occupy the mind of a woman. And he, too, has the way clear before him, for those who think he is wrong will not answer him, or stoop to enter into the details of so uninviting an inquiry. If he likes to wave his flag, he must wave it. All that need be said is that this waving of moral flags is a cheap, an easy, and it must be remembered a very familiar, process. It is so simple—to leave out of consideration all the practical difficulties of life, to take the high and mighty line, and to identify crotchets with Christianity. From our cradles we have all been accustomed to hear the objection to an army that it is a machinery for hiring Christians to commit murder for a shilling a day, and the objection to an Established Church that the apostles managed to make converts without enjoying incomes of 5,000*l.* a year. Governments with real responsibility on them cannot regard life with this primitive straightforwardness, and must be content to trust that what is really required for the health and security of a people is also the most in harmony with Christianity. But if Governments are fettered, ex-Ministers who belong to a smashed party without a programme are as free as air, and Mr. STANSFELD is as ready as Sir WILFRID LAWSON to ask the constituencies to do nothing but look at his red flag when they are next asked to vote. This seems a very poor way of proceeding for a man who a few months ago was a Cabinet Minister. If Mr. STANSFELD had chosen to proceed in a proper way, he might easily have done so. He says that he can show that the Acts do not produce the particular benefit which they were intended to produce. If the fact be so, it is a most important fact, and would have due weight with Parliament. But if Mr. STANSFELD were to assert this in Parliament, and succeed in obtaining an inquiry into the matter, he would have to do something very different from unfurling a flag, and proclaiming himself a Christian, and sympathizing with ladies who throw off the modesty of their sex. He would have to confront medical and naval and military witnesses, and would have to come to facts and proofs. It might be that he would prove his point; but he would have to prove it; and to convince a Committee of business-like men discussing with practical aims, and because it is their duty to discuss it, a disagreeable subject, is a much harder thing than to discuss the subject before a mixed audience, to appeal to the prejudices of women on a matter of which it is to be hoped they are utterly ignorant, and to announce that the views of Mr. STANSFELD and the law of God are identical.

Mr. OTWAY is a good example of the vanquished Liberal who has no flag to unfurl, who recognizes that his party was thoroughly beaten at the last elections, who thinks that the defeat was greatly due to the errors of the Liberal leaders, and who, looking at things as they are, is very well content that the

Conservatives should be in office. This is a very sensible way of treating current politics; but that this should be the view of most Liberals who do not wish to see the party reunited by some spurious agitation being got up for an undesirable object, shows how completely smashed the party is for the present. If there were a chance of things turning in favour of the party, the unfurlers of flags might be induced to wave their banners for the moment in some very quiet and obscure corner; but so long as men like Mr. OTWAY think that the country gains by the Conservatives being in office, the Liberal party has nothing to begin upon, more especially as this opinion, we may be sure, is shared by a large portion of the late Cabinet. The Conservatives have only to go on doing their work as well as they can in a steady unambitious way. We perceive with pleasure that the HOME SECRETARY has one gift which is very useful to a man in his position. He knows when those with whom he confers have something really to say to him, and when they have not. Mr. CROSS has been paying a visit to Scotland, and among other subjects which have engaged his attention is that of the abolition of turnpike tolls. He received a deputation of eminent persons who favoured the abolition, and after hearing them, he explained to them that they had nothing to tell him. They merely set before him facts which are already contained in a Blue Book, and a Bill which has already been submitted to Parliament. What is practically to be done is the question, and if they could have suggested anything in this direction, he would have been delighted to hear it. To repeat information which he already possessed was a mere waste of time; and it was only in case of their having taken the trouble to think what lesson was to be deduced from this information that they could have helped him. They candidly told him that they innocently imagined that thinking was his business and not theirs. But Mr. CROSS would not stand this. If he was to be left to do all the thinking, he would do it as well as he could, but he wished it to be recorded that he quitted them on the understanding that they confessed they had not an idea among the whole lot of them. They were quite satisfied, and thanked him for the courtesy and kindness with which he had received them. If they were satisfied, the public may be satisfied too. It is not a bad sign for a Government when a Minister shows that he can take the exact measure of a deputation.

ITALY.

THE various Italian Ministries which succeed each other with somewhat inconvenient rapidity have no very great political differences to distinguish them, but each in turn has to encounter minor difficulties of a very embarrassing kind. The general policy of Italy is fixed, whoever may be in office. The vast majority of the nation is firmly bent on upholding the unity which has been won at so great a cost and in so surprising a manner, and there is no opposition worth noticing to the form of government. A few misguided zealots may get up an isolated movement in favour of a Republic, and GARIBOLDI may issue his fulminations and decrees against his enemies after a fashion which strangely resembles that adopted by the person whom of all others he would least like to copy—the POPE. But the reactionary party and the Republican party, although they exist in Italy, and are not without some resources and influence, have no hold on the general body of electors; and although German unity rests in some ways on a surer foundation than Italian unity, because it has much more military strength to support it, yet there is less political division in Italy than there is in Germany. The religious question is less troublesome, as it touches temporal rather than spiritual interests, and the Italians as a rule are troubled with no scruples of conscience whatever as to the treatment which they have bestowed on the Church. If they reflect at all about it, it is to pique themselves on what they think the extreme, and perhaps foolish, generosity with which they have treated the POPE. As to the foreign policy of Italy, it is undeviating in its simplicity. It consists entirely in loving and courting and behaving well to every one when it is once recognized that Italy is to keep all she has got. And Italy is, so lucky, and reaps so much benefit from having one simple line of policy, that something is always happening to remind the world of Italian suc-

cess. In utter defiance of France, and in complete disregard of the engagements which France had exacted, Italy seized on Rome. Without Italy having to raise a finger or spend a penny, Germany took on herself the trouble of going on fighting until the impunity of Italy was assured. As a slight protest against the wrongdoing of Italy the *Orénoque* was stationed at Civita Vecchia. Now the *Orénoque* is recalled, and the various organs of French opinion, though all inclined to abuse their own Government, concur in admiring the tact and kindness with which Italy has graciously allowed the MACMAHON Ministry to take its own time in paying this tribute to Italian ascendancy. Nor is this all. France is now, like Mr. COOK'S tourists, going on a tour through Italy, conducted personally by M. THIERS; and M. THIERS, who for a dozen years was the persistent adversary of Italian unity, moves on from one Italian city to another assuring Italy how truly he loves her, and how much he rejoices in her success; and all that the Ministerial critics of M. THIERS have to say is that Italians ought not to love M. THIERS in return exclusively, but should condescend to remember that Marshal MACMAHON earned his staff and his dukedom at Magenta. Italy is like a naughty handsome boy, and the French parties are like aunts who have scolded and rated the scapegrace for every fresh freak, but who, when they find that he has grown up and really come into his property, vow that they adored him from his cradle, and protest that they were always meaning to give him endless sugarplums, only that circumstances unfortunately checked their liberality.

But although Italy has at present no questions which touch her existence to disturb her, those who undertake to manage her affairs have no slight difficulties to encounter. There are two thorns constantly in their side. There is the question how Italy is to pay her way, and the question how brigandage is to be put down, and on each of these questions there are endless controversies and disagreements. Signor MINGHETTI is now at the head of affairs, and he has just explained his views to his constituents at Legnago. His primary notion is that, as these are the two great questions for Italy, they should occupy the attention of the country until they are satisfactorily disposed of. One thing at a time is the principle of conduct on which he insists. There are many abuses to be reformed, many legislative provisions which are necessary if law and administration are to be what Italy would like to see them. Zealous Italians have their crotchets which they are burning to see Parliament take up, and the PRIME MINISTER does not at all deny that many of these crotchets are very good crotchets in their way. But he asks his countrymen to agree with him that the time for taking them up has not yet come. As in England, when Sir ROBERT PEEL came into office and had to face the deficit caused by Whig financiers, he would not allow any question to be discussed until the balance of the Budget had been satisfactorily restored, so, now that Italy has even a more serious deficit to lament, Signor MINGHETTI wishes that the consideration of all minor reforms should be postponed until Italian finance is put on a sound footing. That this should be done, two things are essential. In the first place, enough money must be raised by taxation to meet those wants of the country which are absolutely indispensable, and for this purpose taxes must be wisely imposed and rigorously collected. On the incidence of some of the most important taxes Parliamentary Committees have already reported, or can be instructed to report, and there is no want of diligence or ability in the reporters. What is needed is that the Italian Parliament and the constituencies should take to heart the lessons which these reports teach, and be resolute in giving them effect. If this were done, Signor MINGHETTI is confident that Italy would show itself indisputably solvent, and that the gigantic evil of a depreciated currency might be successfully attacked. There is no doubt a deficit for the coming financial year which, even if it is reduced as far as the most sanguine calculators think it can be reduced, would nearly reach a million sterling. Before long, however, the expiration of existing Treaties of Commerce will give Italy the opportunity of making new arrangements which, although conceived in the spirit of Free-trade, will be beneficial to her pocket; and if the taxes were better arranged, Italy could probably find another million sterling. But then there is something more wanted. The Budget cannot be balanced if the country is to rush into new expenditure. The position taken up by Signor MINGHETTI is that, if it is proposed to spend a franc more, it must be first

wn where the franc is to come from. The Ministry which preceded that of Signor MISQUETTI fell because the Italian Parliament insisted on voting the expenditure of certain sums on a harbour, although the Government protested that there was no money that could be applied to that purpose. The friends of inconsiderate expenditure have not gained much by opening the door of office to Signor MISQUETTI. He erects into a principle what his predecessors insisted on under special circumstances. He announces that he will not listen to any proposal for new expenditure unless the advocates of this expenditure at the same time express their willingness to vote for some new tax which will supply the requisite funds; and it will very seldom happen that the hope of the popularity to be gained by conferring a local benefit or perpetrating a local job will not be outweighed by the fear of the odium attaching to a proposal to burden still further the distressed taxpayer.

Finance is the first subject that occupies the attention of a prudent Italian Minister, but brigandage is the second, and as life is more valuable than money, it may be almost said to be as important for Italy to put brigandage down as to put her finances in order. Simple brigandage is indeed not a very difficult thing to cope with. If it is only a few ruffians who carry off a traveller to get a ransom paid for him, there is some chance that, as the country becomes better cultivated and the roads more frequented, the ruffians may think it worth their while to go into a quieter line of business. The police, too, may hope to catch the offenders and bring them to justice. An ecclesiastic has just been carried off at no great distance from Rome, and his family could not get him back until they had paid a large ransom. But the police have, it is said, caught the offenders, and it may be expected that this will be a warning to their friends and neighbours. The old Papal administration was so wretchedly bad, and brigands who mixed a little superstition with their passion for crime were so readily tolerated, that it is not wonderful if traces of old customs linger in a district where brigandage a few years ago was recognized as a peculiar but rather pious way of gaining a livelihood. It is when something very different is meant by brigandage that it becomes dangerous—when it is an organized system, a vast conspiracy of one half of society against the other, a machinery of terrorism carried into daily life. Such a state of things is found to some extent at Naples, and on a much larger scale and in a more terrible form in Sicily. For such an evil the remedy must be sharp; and law with its regular processes is inadequate. We again have the honour of supplying a precedent to Italian admirers of our Constitution, and Signor MISQUETTI says that Italians need not be ashamed to have to do in Southern Italy and Sicily what free and enlightened England has had to do in Ireland. The parallel seems to be a perfectly just and right one. English law could not repress agrarian crime in Ireland, because no persons would give information and no jury would convict. The Government was entrusted with the power of sweeping off the persons it considered dangerous and shutting them up in prison, and agrarian crime was effectually repressed. Not long ago the Italian Government determined to use or assume a similar power, and summarily arrested and carried off sixty members of the Camorra of Naples. There is no other way of breaking up such an organization, and the Italian Parliament must make up its mind either to let the Camorra flourish or to sanction such arbitrary steps on the part of the Government. In Sicily things are worse, because the system of organized and associated brigandage prevails over so much larger an extent of country. Up to this time the Government has only tried half-measures, for there is a powerful party which is opposed to any sterner measures being tried, and no doubt there would be a considerable irritation caused in Sicily, which is by no means well disposed to the Italian Kingdom, if the Government were permitted by law to do things in Sicily which in Italy generally would not be tolerated. When in Sicily there are persons whom the police have strong reason to suspect to belong to the associated brigandage, these persons can be summoned and solemnly warned; but this only puts them on their guard. Or, if there is more proof of guilt, they can be sent to a neighbouring district, and not allowed to leave it; but they are very little affected by this, and keep up uninterrupted communications with their old accomplices. What the Ministry will probably ask Parliament for is the power to seize on suspected persons, and send them to a place of confinement

out of the island. This would, it is thought, have real terrors for the brigands, as it would take away the hope of release through a revolution, which robs imprisonment in the island of its terrors, and would debar the prisoners from making the gaol, as they often make it now, a centre where, through those released, and even through the gaolers themselves, new plots for crime are hatched. This is, no doubt, to treat persons not legally convicted in a very arbitrary manner; but it is at least well for a country that it should be governed by men who have the courage to speak plainly, and to let it be understood that, if organized brigandage is to be suppressed, an arbitrary way of dealing with it must be adopted and sanctioned.

POLITICAL THEORISTS.

SOME politicians think of their country and its institutions only as materials for ingenious theories of reconstruction; yet, except that its prospective security is perhaps affected by the license of modern speculation, England in its political and social condition can scarcely be thought urgently to require revolutionary changes. Many political and social imperfections exist; but, in comparison with former times, or with the state of foreign nations, something may be said for the results of absolute freedom and of a complex traditional constitution. One of the most thoughtful and acute of economists and politicians, associated during the greater part of his life with the advocates of reform, has often of late disturbed the complacency of optimists by pointing to the "Rocks Ahead" which he discerns with painful clearness of vision. Mr. GREG doubts whether the historical continuity of political improvement may not be violently interrupted through the supremacy of the multitude; and he apprehends that the industrial supremacy of England may be impaired and gradually destroyed through the unavoidable exhaustion of coal. CASSANDRA, to whom Mr. GREG often compares himself, was an instructive if not a cheerful prophetess; yet the chief drawback to the utility of her warnings was, not that they were neglected by her hearers, but that the doom which she foretold was irrevocably predetermined in the councils of the Gods. It is difficult to escape from Mr. GREG's melancholy conclusions, for household suffrage cannot be abolished, and it will probably be extended; and it is even more impossible to create fresh fuel than to re-establish bulwarks against democracy. The political student might almost be excused for any sophistical evasion by which he might endeavour to escape from Mr. GREG's gloomy vaticinations. Unfortunately he finds himself compelled to admit that he is dealing with a logical reasoner who is furnished with an inexhaustible provision of accurate statistics. The office of foreboding evil has been discharged by more authentic prophets than CASSANDRA. The Assyrian conquest was announced again and again by JEREMIAH as an inevitable calamity which could only be alleviated by submission. Entertaining the convictions which he has unwillingly and deliberately adopted, Mr. GREG performs a public duty by calling attention to dangers which may perhaps be averted or delayed by timely precautions. It may be conjectured that, if he had the power of regulating the course of events, he would prefer existing imperfections to the risks of the unknown future.

A theorist of a different class has lately broached with unhesitating confidence political opinions which are not equally entitled to serious consideration. Sir GEORGE CAMPBELL has in the course of active official life done so much good service that it almost seems harsh to object to his crude and confident proposals; yet he would scarcely accept as a becoming reward for his services unlimited liberty to indulge in irresponsible talk. Some excuse for his hasty suggestions may be found in the sudden discontinuance of the arduous administrative labours of his previous life. A wheel which goes on revolving without purpose after it has been disconnected from the motive power and from dependent machinery will in time probably itself attain a state of rest. The desire of new employment is in such a case intelligible and even laudable; and Sir G. CAMPBELL's energy may be turned to practical use if he succeeds in finding a seat in the House of Commons. In the meantime he is apparently compelled to solace himself with social science, which offers many temptations to unemployed mental activity. Sir G. CAMPBELL surprised the Social Section of the British

Association by the proposition that there was no such thing as property in land; and at the Social Science Association he calmly announced the expediency of abolishing all academical endowments, and he informed his audience that those classical and mathematical studies which have been pursued for many generations by the English Universities are only cultivated under the influence of unreasoning superstition. If Sir G. CAMPBELL has profoundly studied the theory of the higher education, his single-minded devotion to his public duties must have been greatly exaggerated by popular repute. His lucubrations on trade and political economy perhaps deserved more attention, because he has had large practical experience of the wants and resources of a numerous community. It is now generally agreed that in his controversy with Lord NORTHBROOK Sir G. CAMPBELL was in the wrong; but nevertheless his judgment on questions of Indian administration is entitled to respectful consideration. If an English schoolmaster should undertake to correct Sir G. CAMPBELL's erroneous notions as to the government of Bengal, his suggestions would be neither more nor less valuable than Sir G. CAMPBELL's condemnation of the study of Latin and Greek and mathematics. Scholars and men of science form so small a minority in any mixed assembly, that an attack on systematic study and solid learning usually produces applause. Yet Sir G. CAMPBELL's denunciation of endowments seemed to be unanimously disapproved even by an audience accustomed to the vagaries of social science. It seemed not to have occurred to Sir G. CAMPBELL that the question was probably not altogether new, and that general opinion had not been passively waiting for the arrival of a philosopher from India, wholly unaffected by English prejudices. When young men begin to think on important subjects, their rapid discoveries and positive conclusions are regarded by maturer minds with a feeling of tolerant amusement. A vigorous intellect released in middle age from absorbing occupation naturally exhibits the peculiarities, if not the presumption, of youth.

Sir G. CAMPBELL repeated to the Social Science Association in a different form his fantastical application to English land of Indian systems of tenure. Antiquaries and historical jurists have of late years thrown much light on primitive forms of landed property, and on the various conditions under which it exists in many parts of the world. It is well known that previous writers had too commonly assumed that the English distribution of the ownership and occupation of land was universal, if not necessary; and probably there are still English landlords who have never doubted that they and their tenants and the labourers on their estates form the indispensable elements of an immutable society. Sir G. CAMPBELL was at liberty, if he thought it worth while, to confirm by his authority the familiar statement that land tenure is not the same in Bengal as in England, though his preference for the system which may suit a simpler and more primitive community might probably be mistaken. Experience has nothing to do with the sweeping doctrine that no property in land can have a rightful or natural existence. It seems probable that an institution which has existed for centuries in England and throughout civilized Europe may at least be intelligible, and perhaps even defensible. If Sir G. CAMPBELL had taken more time to think and to learn before he commenced his course of dogmatic teaching, he might perhaps have discovered that all rights of property are ideal and conventional in the same sense with the dominion of land. The right of the possessor of a shilling to command a shilling's worth of commodities or of personal service is in all respects analogous to the right of a landlord to receive rent for the use of his fields by a tenant. If a system of Communism is ever practically established in England or in any part of Europe, it will probably have been gradually introduced by the preliminary confiscation of the property of landowners. Mortgagees will necessarily be submitted to the same process of expropriation, and then the question will immediately arise why other public and private creditors should have an advantage over those who have invested in landed security. It will be impossible to stop short even with the adoption of M. LOUIS BLANC's formula, that all persons shall receive from the State or other universal distributor according to their needs. Consistent levellers will easily prove that no man has a right to need more than another; and ultimately a vast community compelled to work by military discipline will be maintained, if it is maintained at

all, on uniform rations. A system of society modelled, except that it would have no external aid, on that of Bengal during a famine would scarcely approve itself to Sir G. CAMPBELL's judgment. He would probably dispute the inferences which are drawn by his critics from his partial and hasty judgments. It is only by way of illustration that it becomes expedient to comment on his sudden conclusions. In political controversy some things must be taken for granted, nor is it desirable incessantly to take the social machine to pieces for the purpose of seeing how it is made. The English nation is happily by no means ready to accept novel theories from unsophisticated Anglo-Indian instructors. The traders of Bradford, who are probably not profound Greek scholars, lately voted by an overwhelming majority that Greek should be taught in the grammar school where their sons are educated. Sir G. CAMPBELL's simple-minded belief that whatever is wrong would not have commended itself to the obtuse minds of Yorkshire manufacturers.

THE DUKE OF PADUA AND MARSHAL MACMAHON.

SUCH attention as French politicians have been able to spare during the last week from the Spanish Note and the recall of the *Orénoque* has been claimed and merited by the Duke of PADUA. When the Government came to study this gentleman's address to the electors, it seems to have occurred to them that to favour his return would be tantamount to accepting his reading of the events which the Septennate is to usher in. Perhaps if the Duke had restricted himself to the expression of his hope that NAPOLEON IV. would then be placed on the throne, the Government might have condoned this, as they have condoned a good many other Imperialist sentiments. But he went on to say that the best means of preparing the way for this blessed re-uit would be to return Imperialist deputies and thus to create in the Assembly itself a majority of the right sort. If after this the Government had given him any active countenance, they would have been asked whether they took the same view as the Duke of PADUA as to the result of electing Imperialists; and in this respect common sense is so entirely on the Duke's side that no amount of Ministerial denials would have persuaded people to the contrary. Under these circumstances the Cabinet decided to remain neutral, but they have found to their cost that it is almost as true of neutrality as of a quarrel, that it takes two to make it. If so, the Duke of PADUA was resolved that he would not be one of the two. With admirable boldness he wrote to all the Mayors in the department asking them for their kind assistance in promoting his return, and grounding his request on the fact that in a recent interview Marshal MACMAHON had authorized him to declare that the Government wished to maintain the strictest neutrality in the contest in Seine and Oise. This was more than the Ministry could stand, and at the risk of alienating the Bonapartists altogether, the *Français* was instructed to say that, in presenting the MARSHAL to the electors in the character of a sympathizer with the Imperialist candidate, and in giving a political meaning to a conversation which was only an interchange of the ordinary social courtesies, the Duke of PADUA had been guilty of an unworthy manoeuvre. Lest this disavowal should not make a sufficient impression on the Mayors, the Prefect was directed to send them a formal Circular reminding them that in the department of Seine and Oise he alone had the right to speak to them in the name of the Government, and warning them that the neutrality which the Government wished to enforce on them was a different neutrality from that contemplated by the Duke of PADUA. The Duke had assumed that by refraining from taking any part in the election the Government had left its subordinates free, even in their official capacity, to take what part they liked. The Prefect pointed out that what the Government meant to convey was that its subordinates in their official capacity should support neither candidate. The Duke of PADUA replied to this Circular by another letter addressed to the Mayors. Considering the relations which exist in France between the Prefect and the Government, and the extreme improbability that the Prefect would have written in such terms if he had not been acting under orders, the Duke's second letter is a masterpiece. The Prefect's Circular, he says, is nothing else than a breach of the neutrality pro-

claimed by Marshal MACMAHON. In saying that he alone has the right of giving expression to the views of the Government, the Prefect deceives himself. Above Prefects and Ministers alike there is the Chief of the State. "I have made you acquainted with the language used to me by Marshal MACMAHON, and I reassert in the most absolute manner all that I have said of it. The Circular will not, I am sure, have the effect which the Prefect and the Republican candidate may expect it to have."

At this point the patience of the Government gave way. To see their own Prefect put aside and told that he did not know his business, to see the Mayors cautioned not to pay any attention to him but to take their instructions from the Duke of PADUA, was too much for the most Bonapartist member of the Cabinet. On Wednesday a Council of Ministers was held, and the Duke of PADUA was dismissed from his place among the Mayors. The commune of Courson L'Aulnay knows him no more. Even now, however, the DUKE was not silenced. This time he writes direct to Marshal MACMAHON, and makes it very clear that though the Chief of the State may be above Prefects and Ministers, he is not, in the Duke of PADUA's estimation, above the Duke of PADUA. At another time, he says, he should have allowed the Ministerial decree to pass with silent indifference, but under existing circumstances he is compelled to notice it. It may be that, in dismissing him from his post, the MARSHAL intends to disclaim the language he attributed to him in their recent interview. In that case the DUKE feels it his duty to affirm once more the absolute exactness of his version of it, and he believes that nobody will doubt his word. This is really an extremely clever line to take. It seems to place the MARSHAL and the Duke of PADUA in opposition as to what took place at an interview at which only they were present. Upon this point the DUKE's memory may be as accurate as the MARSHAL's; indeed, as the MARSHAL has political reasons for disavowing the DUKE's interpretation, it is likely to be even more accurate. The Duke of PADUA evidently calculates that the readers of his letter to Marshal MACMAHON will not be at the trouble of referring to his original letter to the Mayors. If they do refer to it, they will of course see that it is not the account given by the DUKE of the MARSHAL's words which the Government has disavowed, but the inference as to the liberty allowed to the Mayors which the DUKE chose to draw from those words. Marshal MACMAHON told the Duke of PADUA that his Government would maintain a sincere neutrality between him and M. SENARD, and this statement has never been challenged. It was only when the DUKE went on to argue that this declaration of neutrality on the part of the Government was tantamount to full permission to the Mayors to constitute themselves partisans that the Government interfered.

Whatever influence this correspondence may exercise on the particular election to which it relates, the Duke of PADUA may cheer himself by the reflection that he has caused the Government a great deal more annoyance than they have caused him. He has compelled them to come to an open quarrel with an Imperialist leader, and by this means to run the risk of alienating Imperialist support in any department—if there still be such a department—in which a candidate declares himself as a supporter of the Septennate pure and simple. Even the *Journal de Paris*, hitherto the most ardent advocate of the coalition with the Bonapartists, has been compelled to change its tone, and now writes with edifying gravity of the Empire as the cause of all the misfortunes under which France has lately suffered—of the unity of Italy, of the expedition to Mexico, of the aggrandizement of Prussia, and a hundred other services of the same kind. Ministerialists who take this tone must be supposed to have counted the cost, and it must be admitted that the attitude of the Duke of PADUA made it very difficult for them to take any other. But the cost may possibly be greater than they expect. If the Imperialists had no passions, they would still support the personal Septennate, no matter what insults they might have to endure from its partisans. The longer France can be kept without a settled Government the better will be the chances of Imperialism, and if the Bonapartists can but bear this in mind, they will persist in turning the other cheek. But the Duke of PADUA's letter to Marshal MACMAHON seems to show that there is a limit beyond which even the humility dictated by interest cannot go. The shrewdest politicians are not free from bursts of anger, and it is far

from unlikely that under the influence of one of these the Imperialists may not only withdraw their support from Ministerial candidates in elections, if any such should present themselves, but what is more serious, decline to vote with Ministers in the Assembly. In that event it is not very evident how the Government will make good their defection. If they lose the Bonapartists, they must appeal either to the Legitimists or to the Conservative Republicans, to the Extreme Right, or to the Left Centre. Their chance of winning back the former seems smaller than ever. The Duke DECAZES has already given them grave offence in recalling the *Orénoque*, and he may have to give them further offence by withdrawing the officials who are accused of showing Carlist sympathies on the Pyrenean frontier. An alliance with the Left Centre is always to be had, but it can be had only on one condition—the recognition of the Republic. The care which M. DUBAURE has lately taken to identify the Government of Marshal MACMAHON with that of M. THIERS shows that he has not yet given up the hope of seeing the Republic frankly accepted by Marshal MACMAHON, and the state of utter friendliness in which the Government is likely to stand at the opening of the Session will make it a matter of the utmost moment to them to construct a majority of some kind. But an alliance with the Republicans will be a very bitter pill for the Orleanists to swallow, and there have lately been some indications of an intention on their part to desert Marshal MACMAHON if he should desert the Conservative party by taking the Left Centre into his counsels. The MARSHAL would then have to choose between governing with a majority from which the party who had placed him in power was altogether excluded, and governing with no majority at all. Either of these expedients would be exceedingly distasteful to him, and we do not know that there are any data from which to conclude which of the two evils he would think the less. The Duke of PADUA may not have done the best for his party in forcing the Government to disown him so publicly, but he may enjoy to the full the pleasures which flow from gratified spite.

THE LONDON GAS COMPANIES.

THE Metropolitan Board of Works and the Corporation of the City of London have determined to apply in the next Session of Parliament for powers to supply gas within their respective districts. The Bills to be introduced will probably contain provisions for the construction of new works for the manufacture and distribution of gas; but, if the promoters are in earnest, their real object will be more reasonable and more defensible than the absurd project of doubling the expenditure already incurred in the provision of a necessary of life. The real question for Parliament to consider will be the future ownership of the existing works, and not the waste of an enormous sum and the sacrifice of valuable space in the erection of new gas-works. The inhabitants of London, even where they are indifferent to the spoliation of joint-stock property, would scarcely desire that every street in the metropolis should be disturbed by laying down a second set of mains for the purpose of rendering the existing distributive apparatus useless. That this is the scheme ostensibly recommended by certain members of the Board of Works and the Corporation is only an additional illustration of the national tendency to conduct business by the machinery of fiction. In applying for power to construct works the municipal bodies aim at a compulsory purchase, which they hope to effect on inequitable terms by the aid of a formidable menace. Eight years ago an attempt to confiscate a part of the property of the Gas Companies was universally condemned; nor has Parliament in a single instance allowed Corporations to purchase gas-works against the will of their owners, even at their full value. The alternative power of establishing a subsidized competition which it would be impossible to resist has never been seriously claimed before a Committee. Gas consumers have but a small and doubtful interest in the transfer of the supply of gas from Joint-Stock Companies to representative bodies. If the works are bought at a fair price, gas can neither be made cheaper nor better by a Corporation than by a Company; and the prospective reduction of price or improvement of quality as the consumption extends is an advantage common to both methods of supply. In Manchester and some other towns the Corporation raises an income from the profits of supply, for the benefit of the general community. If the supply

were in the hands of the Company, the surplus would under the general law be applied to the reduction of price.

The recent agitation has been caused by the rise in the price of gas which was sanctioned some months since by Commissioners appointed by the Board of Trade in consequence of the great increase in the cost of manufacture. One of the Companies which were authorized to add a percentage to their charge has already returned to its former rates; but the majority of the Board of Works is not inclined to let slip an occasion of increasing its powers. The authority of the Board of Trade and of their Commissioners was, in the case of the Imperial Gas Company, conferred by an Act passed in 1869. The Commissioners are empowered "to fix such an illuminating power and such a price as shall be calculated to yield the Company with one care and management (after allowing for the excess or surplus, if any, carried, in the then last preceding year to the credit of the divisible profit and to the Reserved Fund of the Company) a dividend attaining as near as may be, but in no case exceeding, the rate of dividend to which the respective capitals of the Company are entitled under this Act and the existing Acts of the Company, and to make up the Reserved Fund and the Contingency Fund of the Company." The Commissioners are in no case to fix the illuminating power lower, or the price higher, than the maximum and minimum respectively fixed by the Act of 1860; and, subject to the foregoing provision, they are to fix the power as high and the price as low as circumstances will permit. After full inquiry the Commissioners, consisting of an eminent lawyer, a chemist of the highest rank, and an experienced actuary, sanctioned the price and power which the Board of Works, who had opposed the demand of the Companies, now resent by the introduction of their Bill. The authorized dividend was ten per cent. on a portion of the capital, and seven per cent. on that which has been recently raised. The present shareholders have of course for the most part purchased their stock at the market rates on the faith of the existing Acts. The dividend of ten per cent. on the capital of Gas Companies was allowed by the public Gas Clauses Bill of 1846; but of late years Committees of Parliament have habitually limited the dividend on newly authorized capital to seven per cent. It was for the protection both of proprietors and consumers that the Imperial Gas Act of 1869, and similar Acts affecting other London Gas Companies, were passed. If, after the legislation of 1860 and 1869, all the owners of gas shares should be suddenly deprived of their property without compensation, the security of personal and of real estate would be gravely impaired.

A member of the Metropolitan Board complained at a recent meeting that, in the absence of municipal institutions for London, the Board had not even power to supply the population with gas. As the same disability attaches in similar circumstances to every Corporation in the kingdom, it would have been strange that a Board created for certain specific and limited purposes should possess unprecedented powers. The dissatisfied representative of a Vestry might have been expected to remember that the City Corporation has as little power to supply gas as the Board of Works. In several instances Gas Companies promoting Bills for additional powers have been met by Corporations with Bills for compulsory purchase, or, as an alternative, for the construction of competitive works. The result has often been a compromise in the form of a purchase; and Committees have always required that the full value of the property of the Companies should be paid, as an indispensable condition of the transfer. The only case in which a Bill for compulsory purchase has been independently promoted was that of the Sheffield Corporation five or six years ago. In that case the promoters offered the full value of the property of the Company; but, as they failed to prove any mismanagement, the Committee threw out the Bill without calling on the opponents. In the last Session the Nottingham Gas Company promoted a Bill for raising additional capital, and the Corporation in turn promoted a Bill for purchase. Before the case was heard the Company agreed to sell their property for a considerable bonus in addition to its market value. An exactly similar contest between the Nottingham Corporation and the Water Company ended, in default of agreement, in the rejection of the Bill for compulsory purchase. The London Corporation and the Metropolitan Board of Works will be unable to adduce a single precedent even for compulsory purchase at the full value of the shares. Their proposal to establish competitive works

is too obviously inexpedient to be adopted, even if it were not flagrantly unjust. It may be assumed that the Corporation and the Board of Works will be unable to prove any case of mismanagement or neglect. The gas referees appointed under the Gas Acts are responsible for the quality of the gas supplied, which might undoubtedly be improved if the consumers were willing to incur the requisite expense. No Committee to which the Bills may be referred is likely to override in substance the decision of the highly competent Commissioners who lately considered the cases of the Chartered Gas Company and the Imperial Company.

Although Parliament has hitherto declined to enforce the transfer of gas and water undertakings from Companies to public bodies, it may be doubted whether it has not committed an error, though on the right side. It is much more important that property should be protected than that Corporations should have the satisfaction of controlling the supply of gas and water; but shareholders, while they are entitled to the full income derived from their capital, have no further claim or interest. A landowner has a sentimental attachment to his fields; but a recipient of ten per cent. on a given sum has no preference for one solvent paymaster over another. If a Corporation consents to pay the annual income, giving sufficient security, the ratepayers may perhaps be pleased, and the gas and water shareholders are in no way hurt. In theory the consumers or their representatives ought to be the nominal owners of the surplus profits to which they are already entitled. The Gas Clauses and Water Clauses Acts of 1846 virtually effected the change of ownership which would be formally accomplished by a transfer. All Gas Companies, after paying their authorized dividends, and providing any reserve allowed by their special Acts, must apply their surplus profits to a reduction of rates. In other words, the consumers are the residuary proprietors, and the shareholders, as long as they earn their maximum dividend, are merely annuitants or mortgagees, and trustees of the surplus. It is consistent with principle that the beneficial owners should administer the estate, inasmuch as the shareholders have no motive for improving the property after their own incomes are fully secured. The holder of 1,000*l.* in the stock of one of the London Gas Companies is entitled either to 100*l.*, or, as the case may be, to 70*l.* a year. The Acts provide that the price may be increased to the point at which his dividend can be earned. He is also entitled to the benefit of a further payment towards a limited reserve or insurance fund. If there are any other prospective advantages, they would be taken into account in settling the terms of a purchase; but, when all the claims of justice are satisfied, Parliament would be justified in establishing, although for the first time, the principle of compulsory transfer. If the Board of Works or the Corporation were to reject equitable terms, their refusal to purchase would involve an acknowledgment that the works could not be more economically or advantageously conducted than at present. It is impossible that any Parliamentary Committee should allow public bodies at a great and wasteful cost to undersell and ruin undertakings which they refuse to purchase.

WIFE MURDER.

IT is satisfactory to find that the HOME SECRETARY has had sufficient firmness to resist the solicitations addressed to him on behalf of the murderer COPPEN, and that the law has been allowed to take its course. COPPEN, we are glad to see, was hanged on Tuesday. We are glad of this, not of course from any unchristian feeling towards COPPEN, but because we trust his death may, if the same course is persistently followed in other cases, be the means of saving the lives of a great many COPPENS, and particularly the lives of their wives. It is obvious that the effect of the criminal law as a deterring influence must necessarily depend upon the degree of certainty with which its threatened punishments are actually inflicted. In proportion to the chances of escape there will be a tendency to reckon on them, and when, in other cases, the law is carried out, it will be apt to have the appearance of injustice or caprice. There was unfortunately nothing novel or peculiar in the circumstances of the murder which COPPEN committed. It was only one of those too familiar cases of the murder of a wife by a drunken husband which continue to occur with increasing frequency, and which, indeed, are becoming

shown where the franc is to come from. The Ministry which preceded that of Signor MINICCHI fell because the Italian Parliament insisted on voting the expenditure of certain sums on a harbour, although the Government protested that there was no money that could be applied to the purpose. The friends of inconsiderate expenditure have not gained much by opening the door of office to Signor MINICCHI. He erects into a principle what his predecessors insisted on under special circumstances. He announces that he will not listen to any proposal for new expenditure unless the advocates of this expenditure at the same time express their willingness to vote for some new tax which will supply the requisite funds; and it will very seldom happen that the hope of the popularity to be gained by conferring a local benefit or perpetrating a local job will not be outweighed by the fear of the odium attaching to a proposal to burden still further the distressed taxpayer.

Finance is the first subject that occupies the attention of a prudent Italian Minister, but brigandage is the second, and as life is more valuable than money, it may be almost said to be as important for Italy to put brigandage down as to put her finances in order. Simple brigandage is indeed not a very difficult thing to cope with. If it is only a few ruffians who carry off a traveller to get a ransom paid for him, there is some chance that, as the country becomes better cultivated and the roads more frequented, the ruffians may think it worth their while to go into a quieter line of business. The police, too, may hope to catch the offenders and bring them to justice. An ecclesiastic has just been carried off at no great distance from Rome, and his family could not get him back until they had paid a large ransom. But the police have, it is said, caught the offenders, and it may be expected that this will be a warning to their friends and neighbours. The old Papal administration was so wretchedly bad, and brigands who mixed a little superstition with their passion for crime were so readily tolerated, that it is not wonderful if traces of old customs linger in a district where brigandage a few years ago was recognized as a peculiar but rather pious way of gaining a livelihood. It is when something very different is meant by brigandage that it becomes dangerous—when it is an organized system, a vast conspiracy of one half of society against the other, a machinery of terrorism carried into daily life. Such a state of things is found to some extent at Naples, and on a much larger scale and in a more terrible form in Sicily. For such an evil the remedy must be sharp; and law with its regular processes is inadequate. We again have the honour of supplying a precedent to Italian admirers of our Constitution, and Signor MINICCHI says that Italians need not be ashamed to have to do in Southern Italy and Sicily what free and enlightened England has had to do in Ireland. The parallel seems to be a perfectly just and right one. English law could not repress agrarian crime in Ireland, because no persons would give information and no jury would convict. The Government was entrusted with the power of sweeping off the persons it considered dangerous and shutting them up in prison, and agrarian crime was effectually repressed. Not long ago the Italian Government determined to use or assume a similar power, and summarily arrested and carried off sixty members of the Camorra of Naples. There is no other way of breaking up such an organization, and the Italian Parliament must make up its mind either to let the Camorra flourish or to sanction such arbitrary steps on the part of the Government. In Sicily things are worse, because the system of organized and associated brigandage prevails over so much larger an extent of country. Up to this time the Government has only tried half-measures, for there is a powerful party which is opposed to any sterner measures being tried, and no doubt there would be a considerable irritation caused in Sicily, which is by no means well disposed to the Italian Kingdom, if the Government were permitted by law to do things in Sicily which in Italy generally would not be tolerated. When in Sicily there are persons whom the police have strong reason to suspect to belong to the associated brigandage, these persons can be summoned and solemnly warned; but this only puts them on their guard. Or, if there is more proof of guilt, they can be sent to a neighbouring district, and not allowed to leave it; but they are very little affected by this, and keep up uninterrupted communications with their old accomplices. What the Ministry will probably ask Parliament for is the power to seize on suspected persons, and send them to a place of confinement

out of the island. This would, it is thought, have real terrors for the brigands, as it would take away the hope of release through a revolution, which robs imprisonment in the island of its terrors, and would debar the prisoners from making the gaol, as they often make it now, a centre where, through those released, and even through the gaolers themselves, new plots for crime are hatched. This is, no doubt, to treat persons not legally convicted in a very arbitrary manner; but it is at least well for a country that it should be governed by men who have the courage to speak plainly, and to let it be understood that, if organized brigandage is to be suppressed, an arbitrary way of dealing with it must be adopted and sanctioned.

POLITICAL THEORISTS.

SOME politicians think of their country and its institutions only as materials for ingenious theories of reconstruction; yet, except that its prospective security is perhaps affected by the license of modern speculation, England in its political and social condition can scarcely be thought urgently to require revolutionary changes. Many political and social imperfections exist; but, in comparison with former times, or with the state of foreign nations, something may be said for the results of absolute freedom and of a complex traditional constitution. One of the most thoughtful and acute of economists and politicians, associated during the greater part of his life with the advocates of reform, has often of late disturbed the complacency of optimists by pointing to the "Rocks Ahead" which he discerns with painful clearness of vision. Mr. GREG doubts whether the historical continuity of political improvement may not be violently interrupted through the supremacy of the multitude; and he apprehends that the industrial supremacy of England may be impaired and gradually destroyed through the unavoidable exhaustion of coal. CASSANDRA, to whom Mr. GREG often compares himself, was an instructive if not a cheerful prophetess; yet the chief drawback to the utility of her warnings was, not that they were neglected by her hearers, but that the doom which she foretold was irrevocably predetermined in the councils of the Gods. It is difficult to escape from Mr. GREG's melancholy conclusions, for household suffrage cannot be abolished, and it will probably be extended; and it is even more impossible to create fresh fuel than to re-establish bulwarks against democracy. The political student might almost be excused for any sophistical evasion by which he might endeavour to escape from Mr. GREG's gloomy vaticinations. Unfortunately he finds himself compelled to admit that he is dealing with a logical reasoner who is furnished with an inexhaustible provision of accurate statistics. The office of foreboding evil has been discharged by more authentic prophets than CASSANDRA. The Assyrian conquest was announced again and again by JEREMIAH as an inevitable calamity which could only be alleviated by submission. Entertaining the convictions which he has unwillingly and deliberately adopted, Mr. GREG performs a public duty by calling attention to dangers which may perhaps be averted or delayed by timely precautions. It may be conjectured that, if he had the power of regulating the course of events, he would prefer existing imperfections to the risks of the unknown future.

A theorist of a different class has lately broached with unhesitating confidence political opinions which are not equally entitled to serious consideration. Sir GEORGE CAMPBELL has in the course of active official life done so much good service that it almost seems harsh to object to his crude and confident proposals; yet he would scarcely accept as a becoming reward for his services unlimited liberty to indulge in irresponsible talk. Some excuse for his hasty suggestions may be found in the sudden discontinuance of the arduous administrative labours of his previous life. A wheel which goes on revolving without purpose after it has been disconnected from the motive power and from dependent machinery will in time probably itself attain a state of rest. The desire of new employment is in such a case intelligible and even laudable; and Sir G. CAMPBELL's energy may be turned to practical use if he succeeds in finding a seat in the House of Commons. In the meantime he is apparently compelled to solace himself with social science, which offers many temptations to unemployed mental activity. Sir G. CAMPBELL surprised the Social Section of the British

Association by the proposition that there was no such thing as property in land; and at the Social Science Association he calmly announced the expediency of abolishing all academical endowments, and he informed his audience that those classical and mathematical studies which have been pursued for many generations by the English Universities are only cultivated under the influence of unreasoning superstition. If Sir G. CAMPBELL has profoundly studied the theory of the higher education, his single-minded devotion to his public duties must have been greatly exaggerated by popular repute. His lucubrations on trade and political economy perhaps deserved more attention, because he has had large practical experience of the wants and resources of a numerous community. It is now generally agreed that in his controversy with Lord NORTHBROOK Sir G. CAMPBELL was in the wrong; but nevertheless his judgment on questions of Indian administration is entitled to respectful consideration. If an English schoolmaster should undertake to correct Sir G. CAMPBELL's erroneous notions as to the government of Bengal, his suggestions would be neither more nor less valuable than Sir G. CAMPBELL's condemnation of the study of Latin and Greek and mathematics. Scholars and men of science form so small a minority in any mixed assembly, that an attack on systematic study and solid learning usually produces applause. Yet Sir G. CAMPBELL's denunciation of endowments seemed to be unanimously disapproved even by an audience accustomed to the vagaries of social science. It seemed not to have occurred to Sir G. CAMPBELL that the question was probably not altogether new, and that general opinion had not been passively waiting for the arrival of a philosopher from India, wholly unaffected by English prejudices. When young men begin to think on important subjects, their rapid discoveries and positive conclusions are regarded by maturer minds with a feeling of tolerant amusement. A vigorous intellect released in middle age from absorbing occupation naturally exhibits the peculiarities, if not the presumption, of youth.

Sir G. CAMPBELL repeated to the Social Science Association in a different form his fantastical application to English land of Indian systems of tenure. Antiquaries and historical jurists have of late years thrown much light on primitive forms of landed property, and on the various conditions under which it exists in many parts of the world. It is well known that previous writers had too commonly assumed that the English distribution of the ownership and occupation of land was universal, if not necessary; and probably there are still English landlords who have never doubted that they and their tenants and the labourers on their estates form the indispensable elements of an immutable society. Sir G. CAMPBELL was at liberty, if he thought it worth while, to confirm by his authority the familiar statement that land tenure is not the same in Bengal as in England, though his preference for the system which may suit a simpler and more primitive community might probably be mistaken. Experience has nothing to do with the sweeping doctrine that no property in land can have a rightful or natural existence. It seems probable that an institution which has existed for centuries in England and throughout civilized Europe may at least be intelligible, and perhaps even defensible. If Sir G. CAMPBELL had taken more time to think and to learn before he commenced his course of dogmatic teaching, he might perhaps have discovered that all rights of property are ideal and conventional in the same sense with the dominion of land. The right of the possessor of a shilling to command a shilling's worth of commodities or of personal service is in all respects analogous to the right of a landlord to receive rent for the use of his fields by a tenant. If a system of Communism is ever practically established in England or in any part of Europe, it will probably have been gradually introduced by the preliminary confiscation of the property of landowners. Mortgagees will necessarily be submitted to the same process of expropriation, and then the question will immediately arise why other public and private creditors should have an advantage over those who have invested in landed security. It will be impossible to stop short even with the adoption of M. LOUIS BLANC's formula, that all persons shall receive from the State or other universal distributor according to their needs. Consistent levellers will easily prove that no man has a right to need more than another; and ultimately a vast community compelled to work by military discipline will be maintained, if it is maintained at

all, on uniform rations. A system of society modelled, except that it would have no external aid, on that of Bengal during a famine would scarcely approve itself to Sir G. CAMPBELL's judgment. He would probably dispute the inferences which are drawn by his critics from his partial and hasty judgments. It is only by way of illustration that it becomes expedient to comment on his sudden conclusions. In political controversy some things must be taken for granted, nor is it desirable incessantly to take the social machine to pieces for the purpose of seeing how it is made. The English nation is happily by no means ready to accept novel theories from unsophisticated Anglo-Indian instructors. The traders of Bradford, who are probably not profound Greek scholars, lately voted by an overwhelming majority that Greek should be taught in the grammar school where their sons are educated. Sir G. CAMPBELL's simple-minded belief that whatever is wrong would not have commended itself to the obtuse minds of Yorkshire manufacturers.

THE DUKE OF PADUA AND MARSHAL MACMAHON.

SUCH attention as French politicians have been able to spare during the last week from the Spanish Note and the recall of the *Orléanais* has been claimed and merited by the Duke of PADUA. When the Government came to study this gentleman's address to the electors, it seems to have occurred to them that to favour his return would be tantamount to accepting his reading of the events which the Septennate is to usher in. Perhaps if the Duke had restricted himself to the expression of his hope that NAPOLEON IV. would then be placed on the throne, the Government might have condoned this, as they have condoned a good many other Imperialist sentiments. But he went on to say that the best means of preparing the way for this blessed re-rit would be to return Imperialist deputies and thus to create in the Assembly itself a majority of the right sort. If after this the Government had given him any active countenance, they would have been asked whether they took the same view as the Duke of PADUA as to the result of electing Imperialists; and in this respect common sense is so entirely on the Duke's side that no amount of Ministerial denials would have persuaded people to the contrary. Under these circumstances the Cabinet decided to remain neutral, but they have found to their cost that it is almost as true of neutrality as of a quarrel, that it takes two to make it. If so, the Duke of PADUA was resolved that he would not be one of the two. With admirable boldness he wrote to all the Mayors in the department asking them for their kind assistance in promoting his return, and grounding his request on the fact that in a recent interview Marshal MACMAHON had authorized him to declare that the Government wished to maintain the strictest neutrality in the contest in Seine and Oise. This was more than the Ministry could stand, and at the risk of alienating the Bonapartists altogether, the *Français* was instructed to say that, in presenting the MARSHAL to the electors in the character of a sympathizer with the Imperialist candidate, and in giving a political meaning to a conversation which was only an interchange of the ordinary social courtesies, the Duke of PADUA had been guilty of an unworthy manoeuvre. Lest this disavowal should not make a sufficient impression on the Mayors, the Prefect was directed to send them a formal Circular reminding them that in the department of Seine and Oise he alone had the right to speak to them in the name of the Government, and warning them that the neutrality which the Government wished to enforce on them was a different neutrality from that contemplated by the Duke of PADUA. The DUKE had assumed that by refraining from taking any part in the election the Government had left its subordinates free, even in their official capacity, to take what part they liked. The Prefect pointed out that what the Government meant to convey was that its subordinates in their official capacity should support neither candidate. The Duke of PADUA replied to this Circular by another letter addressed to the Mayors. Considering the relations which exist in France between the Prefect and the Government, and the extreme improbability that the Prefect would have written in such terms if he had not been acting under orders, the Duke's second letter is a masterpiece. The Prefect's Circular, he says, is nothing else than a breach of the neutrality pro-

claimed by Marshal MACMAHON. In saying that he alone has the right of giving expression to the views of the Government, the Prefect deceives himself. Above Prefects and Ministers alike there is the Chief of the State. "I have made you acquainted with the language used to me by Marshal MACMAHON, and I reassert in the most absolute manner all that I have said of it. The Circular will not, I am sure, have the effect which the Prefect and the Republican candidate may expect it to have."

At this point the patience of the Government gave way. To see their own Prefect put aside and told that he did not know his business, to see the Mayors cautioned not to pay any attention to him but to take their instructions from the Duke of PADUA, was too much for the most Bonapartist member of the Cabinet. On Wednesday a Council of Ministers was held, and the Duke of PADUA was dismissed from his place among the Mayors. The commune of Courson L'Aunay knows him no more. Even now, however, the DUKE was not silenced. This time he writes direct to Marshal MACMAHON, and makes it very clear that though the Chief of the State may be above Prefects and Ministers, he is not, in the Duke of PADUA's estimation, above the Duke of PADUA. At another time, he says, he should have allowed the Ministerial decree to pass with silent indifference, but under existing circumstances he is compelled to notice it. It may be that, in dismissing him from his post, the MARSHAL intends to disclaim the language he attributed to him in their recent interview. In that case the DUKE feels it his duty to affirm once more the absolute exactness of his version of it, and he believes that nobody will doubt his word. This is really an extremely clever line to take. It seems to place the MARSHAL and the Duke of PADUA in opposition as to what took place at an interview at which only they were present. Upon this point the DUKE's memory may be as accurate as the MARSHAL'S; indeed, as the MARSHAL has political reasons for disavowing the DUKE'S interpretation, it is likely to be even more accurate. The Duke of PADUA evidently calculates that the readers of his letter to Marshal MACMAHON will not be at the trouble of referring to his original letter to the Mayors. If they do refer to it, they will of course see that it is not the account given by the DUKE of the MARSHAL'S words which the Government has disavowed, but the inference as to the liberty allowed to the Mayors which the DUKE chose to draw from those words. Marshal MACMAHON told the Duke of PADUA that his Government would maintain a sincere neutrality between him and M. SENARD, and this statement has never been challenged. It was only when the DUKE went on to argue that this declaration of neutrality on the part of the Government was tantamount to full permission to the Mayors to constitute themselves partisans that the Government interfered.

Whatever influence this correspondence may exercise on the particular election to which it relates, the Duke of PADUA may cheer himself by the reflection that he has caused the Government a great deal more annoyance than they have caused him. He has compelled them to come to an open quarrel with an Imperialist leader, and by this means to run the risk of alienating Imperialist support in any department—if there still be such a department—in which a candidate declares himself as a supporter of the Septennate pure and simple. Even the *Journal de Paris*, hitherto the most ardent advocate of the coalition with the Bonapartists, has been compelled to change its tone, and now writes with edifying gravity of the Empire as the cause of all the misfortunes under which France has lately suffered—of the unity of Italy, of the expedition to Mexico, of the aggrandizement of Prussia, and a hundred other services of the same kind. Ministerialists who take this tone must be supposed to have counted the cost, and it must be admitted that the attitude of the Duke of PADUA made it very difficult for them to take any other. But the cost may possibly be greater than they expect. If the Imperialists had no passions, they would still support the personal Septennate, no matter what insults they might have to endure from its partisans. The longer France can be kept without a settled Government the better will be the chances of Imperialism, and if the Bonapartists can but bear this in mind, they will persist in turning the other cheek. But the Duke of PADUA'S letter to Marshal MACMAHON seems to show that there is a limit beyond which even the humility dictated by interest cannot go. The shrewdest politicians are not free from bursts of anger, and it is far

from unlikely that under the influence of one of these the Imperialists may not only withdraw their support from Ministerial candidates in elections, if any such should present themselves, but what is more serious, decline to vote with Ministers in the Assembly. In that event it is not very evident how the Government will make good their defection. If they lose the Bonapartists, they must appeal either to the Legitimists or to the Conservative Republicans, to the Extreme Right, or to the Left Centre. Their chance of winning back the former seems smaller than ever. The Duke DECAZES has already given them grave offence in recalling the *Orléanistes*, and he may have to give them further offence by withdrawing the officials who are accused of showing Carlist sympathies on the Pyrenean frontier. An alliance with the Left Centre is always to be had, but it can be had only on one condition—the recognition of the Republic. The care which M. DUFAYE has lately taken to identify the Government of Marshal MACMAHON with that of M. THIERS shows that he has not yet given up the hope of seeing the Republic frankly accepted by Marshal MACMAHON, and the state of utter friendliness in which the Government is likely to stand at the opening of the Session will make it a matter of the utmost moment to them to construct a majority of some kind. But an alliance with the Republicans will be a very bitter pill for the Orléanists to swallow, and there have lately been some indications of an intention on their part to desert Marshal MACMAHON if he should desert the Conservative party by taking the Left Centre into his counsels. The MARSHAL would then have to choose between governing with a majority from which the party who had placed him in power was altogether excluded, and governing with no majority at all. Either of these expedients would be exceedingly distasteful to him, and we do not know that there are any data from which to conclude which of the two evils he would think the less. The Duke of PADUA may not have done the best for his party in forcing the Government to disown him so publicly, but he may enjoy to the full the pleasures which flow from gratified spite.

THE LONDON GAS COMPANIES.

THE Metropolitan Board of Works and the Corporation of the City of London have determined to apply in the next Session of Parliament for powers to supply gas within their respective districts. The Bills to be introduced will probably contain provisions for the construction of new works for the manufacture and distribution of gas; but, if the promoters are in earnest, their real object will be more reasonable and more defensible than the absurd project of doubling the expenditure already incurred in the provision of a necessary of life. The real question for Parliament to consider will be the future ownership of the existing works, and not the waste of an enormous sum and the sacrifice of valuable space in the erection of new gas-works. The inhabitants of London, even where they are indifferent to the spoliation of joint-stock property, would scarcely desire that every street in the metropolis should be disturbed by laying down a second set of mains for the purpose of rendering the existing distributive apparatus useless. That this is the scheme ostensibly recommended by certain members of the Board of Works and the Corporation is only an additional illustration of the national tendency to conduct business by the machinery of fiction. In applying for power to construct works the municipal bodies aim at a compulsory purchase, which they hope to effect on inequitable terms by the aid of a formidable menace. Eight years ago an attempt to confiscate a part of the property of the Gas Companies was universally condemned; nor has Parliament in a single instance allowed Corporations to purchase gas-works against the will of their owners, even at their full value. The alternative power of establishing a subsidized competition which it would be impossible to resist has never been seriously claimed before a Committee. Gas consumers have but a small and doubtful interest in the transfer of the supply of gas from Joint-Stock Companies to representative bodies. If the works are bought at a fair price, gas can neither be made cheaper nor better by a Corporation than by a Company; and the prospective reduction of price or improvement of quality as the consumption extends is an advantage common to both methods of supply. In Manchester and some other towns the Corporation raises an income from the profits of supply, for the benefit of the general community. If the supply

were in the hands of the Company, the surplus would under the general law be applied to the reduction of price.

The recent agitation has been caused by the rise in the price of gas which was sanctioned some months since by Commissioners appointed by the Board of Trade in consequence of the great increase in the cost of manufacture. One of the Companies which were authorized to add a percentage to their charge has already returned to its former rates; but the majority of the Board of Works is not inclined to let slip an occasion of increasing its powers. The authority of the Board of Trade and of their Commissioners was, in the case of the Imperial Gas Company, conferred by an Act passed in 1869. The Commissioners are empowered "to fix such an illuminating power and such a price as shall be calculated to yield the Company with due care and management (after allowing for the excess or surplus, if any, carried in the then last preceding year to the credit of the divisible profit and to the Reserved Fund of the Company) a dividend attaining as near as may be, but in no case exceeding, the rate of dividend to which the respective capitals of the Company are entitled under this Act and the existing Acts of the Company, and to make up the Reserved Fund and the Contingency Fund of the Company." The Commissioners are in no case to fix the illuminating power lower, or the price higher, than the maximum and minimum respectively fixed by the Act of 1860; and, subject to the foregoing provision, they are to fix the power as high and the price as low as circumstances will permit. After full inquiry the Commissioners, consisting of an eminent lawyer, a chemist of the highest rank, and an experienced actuary, sanctioned the price and power which the Board of Works, who had opposed the demand of the Companies, now resent by the introduction of their Bill. The authorized dividend was ten per cent. on a portion of the capital, and seven per cent. on that which has been recently raised. The present shareholders have of course for the most part purchased their stock at the market rates on the faith of the existing Acts. The dividend of ten per cent. on the capital of Gas Companies was allowed by the public Gas Clauses Bill of 1846; but of late years Committees of Parliament have habitually limited the dividend on newly authorized capital to seven per cent. It was for the protection both of proprietors and consumers that the Imperial Gas Act of 1869, and similar Acts affecting other London Gas Companies, were passed. If, after the legislation of 1860 and 1869, all the owners of gas shares should be suddenly deprived of their property without compensation, the security of personal and of real estate would be gravely impaired.

A member of the Metropolitan Board complained at a recent meeting that, in the absence of municipal institutions for London, the Board had not even power to supply the population with gas. As the same disability attaches in similar circumstances to every Corporation in the kingdom, it would have been strange that a Board created for certain specific and limited purposes should possess unprecedented powers. The dissatisfied representative of a Vestry might have been expected to remember that the City Corporation has as little power to supply gas as the Board of Works. In several instances Gas Companies promoting Bills for additional powers have been met by Corporations with Bills for compulsory purchase, or, as an alternative, for the construction of competitive works. The result has often been a compromise in the form of a purchase; and Committees have always required that the full value of the property of the Companies should be paid, as an indispensable condition of the transfer. The only case in which a Bill for compulsory purchase has been independently promoted was that of the Sheffield Corporation five or six years ago. In that case the promoters offered the full value of the property of the Company; but, as they failed to prove any mismanagement, the Committee threw out the Bill without calling on the opponents. In the last Session the Nottingham Gas Company promoted a Bill for raising additional capital, and the Corporation in turn promoted a Bill for purchase. Before the case was heard the Company agreed to sell their property for a considerable bonus in addition to its market value. An exactly similar contest between the Nottingham Corporation and the Water Company ended, in default of agreement, in the rejection of the Bill for compulsory purchase. The London Corporation and the Metropolitan Board of Works will be unable to adduce a single precedent even for compulsory purchase at the full value of the shares. Their proposal to establish competitive works

is too obviously inexpedient to be adopted, even if it were not flagrantly unjust. It may be assumed that the Corporation and the Board of Works will be unable to prove any case of mismanagement or neglect. The gas referees appointed under the Gas Acts are responsible for the quality of the gas supplied, which might undoubtedly be improved if the consumers were willing to incur the requisite expense. No Committee to which the Bills may be referred is likely to override in substance the decision of the highly competent Commissioners who lately considered the cases of the Chartered Gas Company and the Imperial Company.

Although Parliament has hitherto declined to enforce the transfer of gas and water undertakings from Companies to public bodies, it may be doubted whether it has not committed an error, though on the right side. It is much more important that property should be protected than that Corporations should have the satisfaction of controlling the supply of gas and water; but shareholders, while they are entitled to the full income derived from their capital, have no further claim or interest. A landowner has a sentimental attachment to his fields; but a recipient of ten per cent. on a given sum has no preference for one solvent paymaster over another. If a Corporation consents to pay the annual income, giving sufficient security, the ratepayers may perhaps be pleased, and the gas and water shareholders are in no way hurt. In theory the consumers or their representatives ought to be the nominal owners of the surplus profits to which they are already entitled. The Gas Clauses and Water Clauses Acts of 1846 virtually effected the change of ownership which would be formally accomplished by a transfer. All Gas Companies, after paying their authorized dividends, and providing any reserve allowed by their special Acts, must apply their surplus profits to a reduction of rates. In other words, the consumers are the residuary proprietors, and the shareholders, as long as they earn their maximum dividend, are merely annuitants or mortgagees, and trustees of the surplus. It is consistent with principle that the beneficial owners should administer the estate, inasmuch as the shareholders have no motive for improving the property after their own incomes are fully secured. The holder of 1,000l. in the stock of one of the London Gas Companies is entitled either to 100l. or, as the case may be, to 70l. a year. The Acts provide that the price may be increased to the point at which his dividend can be earned. He is also entitled to the benefit of a further payment towards a limited reserve or insurance fund. If there are any other prospective advantages, they would be taken into account in settling the terms of a purchase; but, when all the claims of justice are satisfied, Parliament would be justified in establishing, although for the first time, the principle of compulsory transfer. If the Board of Works or the Corporation were to reject equitable terms, their refusal to purchase would involve an acknowledgment that the works could not be more economically or advantageously conducted than at present. It is impossible that any Parliamentary Committee should allow public bodies at a great and wasteful cost to undersell and ruin undertakings which they refuse to purchase.

WIFE MURDER.

IT is satisfactory to find that the HOME SECRETARY has had sufficient firmness to resist the solicitations addressed to him on behalf of the murderer COPPEN, and that the law has been allowed to take its course. COPPEN, we are glad to see, was hanged on Tuesday. We are glad of this, not of course from any unchristian feeling towards COPPEN, but because we trust his death may, if the same course is persistently followed in other cases, be the means of saving the lives of a great many COPPENS, and particularly the lives of their wives. It is obvious that the effect of the criminal law as a deterring influence must necessarily depend upon the degree of certainty with which its threatened punishments are actually inflicted. In proportion to the chances of escape there will be a tendency to reckon on them, and when, in other cases, the law is carried out, it will be apt to have the appearance of injustice or caprice. There was unfortunately nothing novel or peculiar in the circumstances of the murder which COPPEN committed. It was only one of those too familiar cases of the murder of a wife by a drunken husband which continue to occur with increasing frequency, and which, indeed, are becoming

so common that they scarcely attract attention. If a man happens in a moment of exhilaration to beat his wife about the head with a poker, or to dance all over her with iron-shod clogs, the magistrates can hardly bring themselves to give him more than a few weeks' imprisonment; and if the woman dies abundant reasons are instantly suggested why her death should be regarded as a trivial kind of accidental manslaughter. In these days of expansive philanthropy it is perhaps not going too far to express a hope that in future the wives of working-men may be murdered less frequently, and that working-men, even if they do not care for their wives' lives, will show some regard for their own, and avoid sharing the fate of CORPEN by refraining as far as possible from imitating his example. The object of hanging CORPEN was of course not to take a poor revenge on the wretched man himself, but to warn others who might be tempted to commit the same crime—or, as it is styled in the euphemism of his friends and sympathizers, error—that they had better not. We gather, however, from the speeches which were made at a meeting of working-men on Saturday last at Camberwell, where CORPEN lived, that there is an opinion that greater indulgence should be shown to persons, especially if they belong to the operative class, who kill their wives. Several speakers urged in extenuation of the crime that it was committed in a moment of passion, and that the murderer had been provoked to do it by words from his wife; and the general tone of the meeting seems to have favoured the theory that a nagging wife must lay her account to be murdered if her husband happens to get drunk or lose his temper. One speaker, Mr. STUBBS, even went so far as to say that every one present was as liable as CORPEN to commit a crime of this kind in a moment of uncontrollable passion. We can only say that we trust that, if Mr. STUBBS should at any time unfortunately yield to that taste for homicide which he assumes to be a common feature of human nature, at least in his own class of life, Mr. CROSS will be then at the Home Office.

It is impossible to shut our eyes to the evidence which meets us at every turn that at the present moment a considerable part of the population of this country is suffering from a sort of epidemic of violence and brutality; and it is to be feared that the origin of this disorder may in a large degree be traced to the morbid tenderness and delicacy with which such crimes are too often treated. It would be absurd to suppose that the execution of CORPEN will encourage Mr. STUBBS or any other gentleman of similar proclivities to murder his wife; but if CORPEN had been reprieved, it might have had a different effect. This is a very good example of the sort of cases in which a question is raised as to the premeditation of a murder. It was shown that CORPEN was not in the habit of treating his wife unkindly, but he had for some time fallen into intemperate habits. On the night before the murder he had been drinking, and when his wife remonstrated with him, he went out for more liquor. It does not exactly appear how he spent the night, but probably he was drinking or sleeping off his debauch. His wife did not see him again till next morning. He was then in the shop, and as she passed through he rushed at her, and, without a word, stabbed her with a long pork-butcher's knife which he had in his hand. Whether the woman had first spoken to him is not known. Before she died she said that she was sorry for her husband, that she had "aggravated" him, and that she hoped he would not be punished. CORPEN, in the statement which he made just before his execution, said that he did not know what occurred before he stabbed his wife. It is possible that she may have spoken sharply to him, but the probability is that it was her love and pity for the man that made her afterwards try to shield him from punishment by suggesting that she had given him provocation. In any case, if there was provocation at all, it could only have been a passing word, as she seems to have been attacked almost as soon as she appeared. It should be observed that CORPEN had that morning borrowed the knife with which he committed the murder from a neighbouring butcher, saying he wanted it to cut bread and butter, and asked to have it "touched up for him"—that is, sharpened. It is unnecessary to suppose that he procured the knife with a deliberate intention to use it upon his wife. He had been drinking heavily, and had possibly been brooding over his wife's reproaches. There can be little doubt that it was not a cold and plotted murder, but that he stabbed his wife because he had maddened himself with drink. Baron

BRAMWELL, who tried the case, impressed upon the jury very strongly that if a man, without lawful cause, and without circumstances to reduce the act to manslaughter, inflicted a deadly wound on another of which that person died, he was guilty of murder, although the thought of doing it never entered his mind until the moment he gave the fatal blow. He added that he told the jury that without a particle of doubt, and that he was as sure of it as of any proposition of law ever laid down. The question is, in fact, whether there is at the moment of killing an intention to kill, or to inflict an injury which may be reasonably expected to result in death. Under these circumstances the jury had no alternative but to find the prisoner guilty of murder, but they were weak enough to add a recommendation to mercy. The HOME SECRETARY has, however, taken the more correct view that those who are most in want of mercy are the wives of men like CORPEN.

It is too often overlooked that the object of capital punishment is to preserve life; and there would no doubt be a general desire to put an end to such punishments if *messieurs les assassins* would only begin. In the present instance it is impossible to say how far the crime was premeditated; but the depth of the wound—six inches, through stays and clothes—shows that the thrust must at the moment when it was made have been intended to do serious harm; and it is as well that experiments of this kind should be discouraged. It appears to have been in the minds of some of the working-men at Camberwell that, if a man is to be hanged for killing his wife in a fit of drunkenness, this is an interference with the liberty of drinking. From this point of view drunkenness is regarded as a sort of certificate entitling the bearer to commit murder with impunity. It would be satisfactory to find that serious reflection on the possible consequences of getting drunk had the effect of promoting sobriety. One of the chief arguments at the meeting at Camberwell was that "mercy had been shown to others 'who had committed' what is called 'rash deeds' similar to that for which CORPEN was condemned. One speaker remarked that, "if the law were always strictly carried out, it would be ridiculous to attempt to save 'CORPEN.' The meaning of this is of course that, as other murderers had been got off, CORPEN might as well be got off too. There can be no doubt that reprieves have been granted in other cases on insufficient grounds, and the consequence has been an impression that capital punishment for murder was going to be gradually abolished. A year or two since a clergyman at Brixton murdered his wife with great deliberation and under circumstances of peculiar atrocity, and his life was spared for no other reason than that he was a respectable person. It is such cases as this which confuse and weaken the public sense of the gravity of crime, and show the necessity of treating it with uniform and unflinching stringency.

THE POLICY OF THE LOCAL GOVERNMENT BOARD.

READERS of the Report of the Local Government Board for 1873 and of Mr. SIMON'S Report for the same year may have noticed some traces of disagreement, at all events in theory, between the Board and its Medical Officer. The medical journals enable us to fix more exactly upon the point on which the two authorities are at variance. Shortly stated, it comes to this, that the Board are of opinion that the additional work thrown on the department by the Public Health Acts should be done by the ordinary Inspectors, while Mr. SIMON is of opinion that the supervision and suggestion of sanitary reforms should be exclusively entrusted to Medical Inspectors. The arguments relied on by the advocates of the latter course are sufficiently obvious. The prevention of disease is at least as important a work as the cure of it; and if we do not think of putting laymen to do the one, why should we put them to do the other? The business of the Inspector is to bring the conclusions of sanitary science to bear on the facts which he finds existing in his district, and he will do this with far greater success if he is himself experimentally acquainted with these conclusions, or has perhaps assisted in establishing them, than if he merely accepts them at second-hand. This reasoning leaves out of sight two very important considerations. The first is that, though the importance of preventing disease is as

great as that of curing it, the difficulty of preventing it is very much less. The cure of actual disease is the highest achievement of the medical art. The prevention of disease is really little more than a matter of common sense. A layman will be helpless in the presence of typhoid fever, but he may know as well as the doctor that the pollution of drinking water by sewage is the ordinary cause of typhoid, and an examination of the relative positions of the well and the cesspool will tell whether such communication is likely to exist in a particular case. An investigation of this kind is not specially doctor's work; it is as much a matter for the civil engineer, or for any one who can use a two-foot rule, can ascertain the fall of the ground, and can find out whether the soil is porous or retentive. No doubt it is essential that the Inspector should be able, if necessary, to check his conclusions by reference to an expert. An analysis of the water contained in the well may disclose the presence of sewage, and this fact is valuable both as satisfying the Inspector that he drew the right inference from the proximity of the well and the cesspool, and also as putting the case in a more convincing and serviceable form. But the necessity of having medical experts to refer to does not involve the necessity of having every Inspector a medical expert, and there is no reason why the choice of the department should be restricted to members of a single profession when the technical training peculiar to that profession is not universally required.

The second consideration left out of sight by what, for convenience sake, may be called the medical party is of still greater weight. The work of the Local Government Board is hardly ever a work of first instance. When the central authorities have made up their minds that such or such sanitary measures ought to be undertaken in such or such a district, they have not got simply to give the order and set the work in train. The real obstacles to sanitary progress have still to be overcome; the local authorities have to be convinced that the measures in question are really necessary. It is with these local authorities that the initiative rests, for the very simple reason that it is by the ratepayers whom they represent that the cost of the work will have to be borne. The Local Government Board have the power, in the last resort, of superseding the local authorities, but it is evident that, if this power were often resorted to, the unpopularity of the central authorities would be so great as to constitute a grave additional difficulty in the way of amendment. It is of extreme importance, therefore, that the suggestions made to the local authorities by the Inspectors should be put forward in such a way as to excite as little opposition as possible. The success of the work will greatly depend on the temper in which it is taken up, and what this temper is will often be greatly determined by the action of the Inspector. It is not meant of course that a medical Inspector may not be in all respects as judicious as a lay Inspector. But the medical Inspector would have a prejudice to get over which does not exist in the case of a lay Inspector. The local authorities suspect a doctor, and the more ignorant and difficult they are to deal with the stronger will be the hold of this suspicion on their minds. They will fancy that the doctor recommends these changes because he must be recommending something. They will look upon the proposed improvements as so much doctor's stuff, which the patient has to take, not to benefit himself, but to swell the doctor's bill. There are few things that Englishmen dislike more than the thought of being delivered over to a professional class, whether it be medical, legal, or clerical. There is a latent disbelief in the value of sanitary measures, which it would not take much to rouse into active life, and nothing would be so likely to have this effect as to treat the expenditure of the whole country on sanitary reforms as a matter to be decided by a few doctors.

Even if it were necessary that the work of inspection should in all cases be done by doctors, it would be advisable to communicate with the local authorities through laymen; and when, as happens to be the case here, there is no need for anything of the sort, to make doctors Inspectors would be wantonly to throw obstacles in the way of sanitary administration. The circumstance that a suggestion has, so to speak, been filtered through the brain of a layman will often dispose a local authority to accept or at all events to consider it, when, if it had come straight from a medical expert, it would have been dismissed without ceremony. This is not an advantage to be despised, and when, as in the present case, it can be secured without sacrificing any of the real essentials

of sanitary progress, it would have been exceedingly foolish of the Local Government Board to forego it. No doubt there are special subjects of inquiry which properly come under the cognizance of the medical officers of the department, just as there are others which properly come under the cognizance of its engineering officers. Mr. SIMON'S Report for 1873 gives an abstract of forty-two such inquiries conducted during that year. The ground for all these inquiries had been an actual outbreak of disease or an unusually high rate of mortality. Here plainly a doctor was the proper person to apply to. But when once the prevalence of disease has been traced to its origin, the exclusive function of the medical expert is at end. In almost all these instances the seat of the mischief lay in the water supply, and the point for the Local Government Board to consider was what steps ought to be recommended to the local authorities to provide the inhabitants with something that they can drink without risk of being poisoned. The questions which present themselves in connexion with this inquiry will be mainly of a financial character. Pure water can always be had if people choose to pay for it, though there may be cases in which it would cost less to remove the entire population of a village than to bring pure water within their reach. To ascertain from what source water can be obtained, and at what outlay, to advise on the respective merits of the different plans proposed, to press upon the local authorities the need of doing something and the superior economy of doing something that shall be really effectual—these are the duties of an Inspector when once the outbreak has been traced to its cause, and there is not one of these which cannot be as well performed by a layman as by a doctor.

The mention of these inquiries reminds us of one very serious omission in the Report of the Local Government Board for 1873. The Report of the previous year contained a similar summary of eighty-one inquiries instituted during 1872. We called attention at the time to the extraordinary sanitary conditions which these Reports disclosed, and we added that the corresponding tabular statement which would appear in the Report of 1873 ought to contain another column, giving the action of the central authority in all cases in which the local authority had failed in its duty. Unfortunately, no such column has been added to the present Report; and, what is even more to be regretted, nothing is said as to what has been done in the cases reported on in 1872. It follows, therefore, that during those two years something like one hundred and twenty places were discovered in which the inhabitants had no choice but to drink sewage, and, of no one of these hundred and twenty places are we told that any measures have been taken to give them something to drink which is not sewage. We do not doubt that in some, perhaps in many, the authorities have bestirred themselves to put an end to this filthy and dangerous state of things. But it is extremely improbable that none of these authorities have been in default, and it is very desirable that the public should know which and how many of them have failed to carry out the orders of the Local Government Board, and what has been done to protect the inhabitants against preventable disease where these orders have not been carried out. It is of the greatest moment to the Local Government Board that it should be supported by a strong and intelligent public opinion, and the first requisite to the creation of this opinion is an accurate knowledge of facts. When eighty-one cases in which whole villages are condemned to drink sewage are enumerated in an official Report, and the next Report comes out and makes no mention of what has been done to relieve them, the charitable supposition would be that the local authorities have done all that was required of them, and that the central department took this as too much a matter of course to deserve mention. If this is the explanation, it is only fair to the local authorities that it should be published. If the charity which hopeth all things has in this instance been greatly deceived, it is equally desirable on other grounds that the shortcomings of the local authorities should not be concealed.

CLERICAL AMUSEMENTS.

THE recent correspondence between the Bishop of Lincoln and the owner of Apology produces a rather mixed feeling. We do not doubt indeed that the Bishop was in the right. As a

general principle, the clergy will not strengthen the position of the Church by becoming owners of race-horses. And if the culprit had been half a century younger, we should have felt not only approval, but sympathy, for the episcopal action. Perhaps the plea of age ought to make no legal difference. Offenders are often pardoned on the ground of tender years; but the indulgence due to old age is not generally understood to mean license for breaking the law. As a matter of fact, however, it necessarily alters our feelings. We cannot be hard upon an old man for preserving some of the prejudices of his youth. Horseracing was never a distinctly clerical amusement; but at least it may be said that in Mr. King's youth the corruptions which are now threatening to drive respectable men from the sport were by no means so flagrant as they are now. Moreover, it is impossible not to feel a sneaking admiration for an old man who retains his sporting enthusiasm. Rightly or wrongly, it seems to imply a kind of masculine vigour which is a good quality even in a clergyman. Whether or not Mr. King is a model priest, we feel that in all probability he is a fine specimen of the English breed; we cannot help in our hearts applauding the old gentleman's pluck, just as we used to admire Lord Palmerston for similar qualities; and it is not quite plain at first sight why a character which may be estimable in the ruler of a country should be altogether inadmissible in the pastor of a parish.

This, indeed, is the most interesting question suggested by the recent discussion. Considering Mr. King's age, he cannot be a scandal to his Bishop for very long, even if he should provide another puzzle for Mr. Thom. Nor is it probable that his example will be imitated by his younger brethren. The very last charge which is likely to be brought against the clergy is that they are given to keep race-horses. But the scandal caused by Mr. King suggests some rather curious questions as to the disqualifications imposed by the clerical character. The rule in all such matters is indefinite enough, and is fixed rather by tradition and by custom than by logical considerations. A clergyman may indulge in most athletic sports; he may play cricket or break his neck in the Alps; fishing is almost a Christian virtue; and, according to Mr. Trollope, no amusement is better suited to the clergy than hunting. Here, however, we come upon debatable ground, and probably the prejudice against a hunting parson is rather growing in strength than otherwise. The objection to hunting, so far as it has any reasonable ground, rests upon the presumption that the amusement costs too much time and money to be compatible with active devotion to a profession; and so far it does not specially affect the clergy. A young barrister or doctor who followed the hounds when he ought to be sitting in court or attending at a hospital would soon find his prospects injured; and the same remark applies in a much stronger degree to the Turf. A clergyman who has a sufficient margin of time and money to be able to attend to horse-racing must be a very exceptional member of his profession.

This purely utilitarian argument, however, is manifestly insufficient to account for the sentiment. The incongruity between the clerical character and the Turf is not really produced by the difficulty of finding time for the two occupations. The Turf is not fit for the clergy, as most people will be inclined to say, because, as at present managed, it is a demoralizing amusement. One of the evils which a clergyman ought to denounce is the taste for gambling; and horse-racing is rapidly becoming more and more decidedly a mere alternative to *rouge-et-noir*. Admitting that it is not necessarily immoral for half a dozen gentlemen to try whose horse can run the fastest, it must be added that this is by no means an exhaustive description of modern horse-racing. The crowd which is to be found upon our race-courses is not exactly in the frame of mind appropriate to divine service; nor does its conduct generally imply that it has much laid to heart the teaching of any variety of clergyman. The practices which are fostered by betting men are not exactly in harmony with an elevated system of Christian ethics. A man, in short, who should preach on Sundays and attend race-courses on week-days would probably have to rub shoulders for six days with all the vices which he denounces on the seventh. He would be bound to warn any of his congregation that, if they chose to go upon the Turf, they would be trying the old experiment of touching pitch without being deified; and it would scarcely encourage a belief in his sincerity if he at once proceeded to try the experiment himself. A sufficiently ingenious excuse indeed has been put forward by some of the sporting newspapers. They admit that the Turf is in great need of purification, and they ask how it is to be purified if all honourable men should stand aloof. Mr. King, they say, and doubtless with perfect truth, is a perfectly honourable man; he has nothing to do with betting or with any of the doubtful practices which it fosters, and acts up to the good old theory which regards racing as a means of improving the breed of horses. This, of course, raises the old question how far a man is justified in doing what is in itself innocent when it incidentally becomes a temptation to others. In this case the answer does not seem to be very doubtful. The mere fact that a perfectly honourable man keeps racehorses without himself sanctioning any malpractices does not necessarily tend to improve the moral atmosphere. It may at least be said with just as much probability that rogues flourish because they are more or less sanctioned by honest people. If the Turf simply consisted of a number of knaves preying upon each other, it would be a nuisance to be suppressed as soon as possible. The fact that it is still patronised by many men of undoubted honour is that which enables

it to hold its ground. Therefore an honest man who keeps racehorses is encouraging an institution which is, to say the least, of very doubtful tendencies; and if his profession is one which imposes upon him the duty of inculcating moral improvement, he cannot be excused for the negative merit of not actually doing wrong himself. He incurs a certain responsibility by mixing in such an occupation, and could only be excused if he took active measures to put down the abuses which threaten to make it an unmitigated nuisance. It would of course be a further question, which we need not argue, whether even in that case he would not act more effectually by denouncing the evil from outside.

This consideration suggests the true reason why a clergyman should be required to observe a higher standard than other men. He cannot, it may be said, be excused simply on the ground of his personal innocence. He is bound to carry on a warfare against the evils of modern society, as well as to abstain from fostering them. And yet there is some difficulty in measuring the force of this distinction. Every man, clergyman or layman, is bound to protest, so far as opportunity serves, against the corruptions which he encounters. If a clergyman has a more definite position and more frequent opportunities of discharging this duty than other men, it does not follow that others are free from the same obligation within their own sphere of employment. In fact, the question cannot be fully solved without inquiring into the true meaning of the clerical calling. People who take the highest view of that calling will naturally be inclined, as a matter of propriety and decorum, if not as a matter of absolute duty, to draw a deeper line between the amusements permitted to the clergy and to the laity. In this, as in many other apparently trivial questions, we find that we are really coming upon profound contrasts of belief. What appears to be merely a question of external manners really runs up into questions about our most solemn conceptions of duty and of the universe. Without entering upon any such speculations, we may remark that the scandal given by such cases as that of Mr. King illustrates a great social change. In Mr. Herbert Spencer's phraseology, the clerical type is being more and more differentiated from the ordinary lay type. This may or may not be on the whole an advantage, but it certainly tends to the disappearance of a character which was not without its merits. The old-fashioned clergyman who has in him a touch of the country gentleman has been in his day a very useful member of society. He had his faults undoubtedly. The special interests of his profession might suffer from his other propensities. Perhaps he hated poachers so intensely as to be rather blind to the poor man's temptations, and was sometimes more interested in improving the breed of pigs than in attending to the souls of his parishioners. Yet his interest in the ordinary pursuits of his neighbours was not altogether a bad thing. He struck deep roots into the soil, and was an important member of the social organism. We generally abuse the eighteenth-century parson as a sordid and selfish kind of person. His religion was not of an exalted type, and consisted to a great extent in a hearty hatred for what he called enthusiasts—that is to say, for anybody who, like Wesley and Whitfield, tried to rouse the people from a comfortable indifference. He was not so averse to a job as he ought to have been; he was apt to seek for promotion by unworthy concessions to possible patrons; and if he became a bishop, he thought it only proper to save a comfortable fortune out of his revenues, and to present his nearest relations to all the best livings in the diocese. Doubtless we have cleared away a great many abuses, and our present race of clergymen take a higher view of their duties and are more devoted to their proper work. But we generally begin to recognize the merits of an old institution when we lose it, and there are some charms in the domestic quiet of the Georgian period, when the Church was not yet torn by furious party spirit, and many excellent clergymen led a good homely patriarchal life, surrounded by their families and respected by their parishioners. Their sermons were undoubtedly sleep-compelling, and their churches shocked all modern notions of architectural propriety. They doubted the advantages of schools, and were absolutely impenetrable to new ideas. But the thought of that era of comparative repose is in some ways agreeable in these more feverish times, and we cannot help fancying that the old-fashioned parson, who was not so much of a priest and a good deal more of the farmer, was sometimes superior to his more straitlaced successor if he occasionally also degenerated into a Trulliber. As the old order changes we look back with some regret, though we must confess that a man ought to live in his own century, and has to be suppressed when he survives too far into another.

FASTOLF AS A STEPFATHER.

FAR up among the oolite hills of Wiltshire, close to the debatable country of Slaughterford and Yatton, lies the narrow valley of Castle Combe. The village at its head was once a place of some importance, but it has now little attraction for the tourist. The church is, in a sense, ancient; but its look of antiquity has been carefully "restored" away. The House which closely adjoined it, and which for a dozen generations was the inheritance of the Scropes, has been deserted by a new owner for a more healthy if less interesting site, and very soon few traces will remain of a family which, after having in the fourteenth and fifteenth centuries overshadowed the land, is now reduced to the one remaining stem which has never left its native Wensleydale.

The Scropes of Castle Combe were little distinguished. Their founder, one of the favourites of Richard II., and high in the service of his successor, was the only man of eminence the house produced, if we except the last of his race, the genial author of *Deer Stalking*. But William Scrope was not the first literary man of his family, though Stephen Scrope, his ancestor, is almost forgotten; except for the one great misfortune of his life, we should seldom recall his name or his writings. On the tower of Castle Combe church there is a shield of arms which belongs to no Wiltshire family, but every villager can point it out to the visitor, and few are so ignorant or so wise as not to smile at they remark that it was placed upon the wall by the famous Sir John Fastolf.

The true character of Fastolf as it comes out in the Paston Letters is not very different from that which Shakespeare has drawn under the name of Falstaff; and the revelations made by the Pastons and their correspondents are fully borne out by various other pieces of contemporary evidence. Sir John was not, as we have lately in some places been told to believe, a very estimable hero in the French wars. The whole story of his foreign adventures has considerable interest. Whether he lost the battle of Patay and won the "battle of the Herrings," whether he killed the Duke of Alençon at Agincourt or only took the Duke's son at Vermeuil, we need not pause here to inquire. His matrimonial relations are so curious, and connected him with so many remarkable characters, that it may be quite worth while to examine them by themselves. Why Shakespeare should have selected him to play the part first assigned to Sir John Oldcastle, why he should have given him so unenviable a notoriety, why he should have deprived him of his social rank—for he was a Knight of the Garter—and other questions of the same kind have been very fully discussed by students of Shakespeare; but that he is not unjustly vilified under the character of "sweet Jack" appears plainly enough by some of his letters in the Paston correspondence, as for instance, when he writes to his agent at Caistor, "I pray you send me word who dare be so hardy to kick against you in my right, and say to them on my behalf that they shall be quyt as far as law and reason will; and if they will not dread nor obey, then they shall be quyt by Blackbeard or Whitebeard, that is to say by God or the devil." In an article on Jack Cade's rebellion published some years ago in the *Fortnightly Review* Mr. Gairdner quoted this letter in elucidation of Fabian's "Bluebeard and other counterfeit names." Mr. Gairdner's authority is deservedly high, but he seems to have stumbled here. Fastolf's strong language contains apparently a reference to the dresses worn by the prominent characters in some popular miracle-play.

Fastolf himself was of a good and wealthy family, which flourished not without credit in the Eastern counties during the thirteenth and two following centuries; and one of them was Sheriff of London in the year in which Sir Nicholas Brember, Richard II.'s "Duke of Troy," was hanged at Tyburn. Lord Kimberley represents, in the female line, the senior branch of the family, which was seated at Kimberley Park. A younger son's son, and a minor at the time of his father's death, John Fastolf early made acquaintance with the harsh customs which he afterwards himself used to such purpose. We first hear of him in Ireland, whither he had accompanied Richard II., and where he seems to have remained during the government of Sir Stephen Scrope, who was Lord Deputy under Henry IV., or rather Lord Deputy's deputy. Sir Stephen and his two brothers were the husbands of the Tiptoft co-heiresses, and Castle Combe was the inheritance of the Lady Millicent. When Sir Stephen left her a widow, which he did in 1408, she was rich, if not very young, and her children were minors. Her little boy was eight or nine at the most, and his sister—for there were but the two living—probably younger. Sir Stephen died in Ireland, and in those days Ireland was a long way from Wiltshire. How was she to return without an escort, and who was so well fitted to undertake the charge as the young Norfolk knight who had been long devoted to her lamented lord? He was now twenty-eight, while she was thirty-six at the least. But such small discrepancies were little thought of then, and widows, especially rich ones, were not expected to wait long in mourning. Lady Millicent, if one account is to be trusted, was however very discreet in this matter, for it was not until Sir Stephen had been dead for eleven months that she accepted the hand of Sir John. She showed some prudence in her prenuptial arrangements, for her new husband bound himself, we read, to pay her 100*l.* a year pin-money, and the payment was continued until 1445. Except in this matter, there is little further mention of Lady Millicent; but a poem is still extant which was possibly written by her son, in which she is eulogized for her virtues, and her life of thirty-seven years as wife of Sir John Fastolf is spoken of, but without a word as to conjugal felicity or any such topic.

Sir John had no sooner married the dowager than he began to arrange for the heir's disposal so as best to advantage himself. A still more distinguished and scarcely less famous knight is brought on the scene. One or two recent revelations have done much to dethrone Sir William Gascoigne from the pedestal he long occupied. His concurrence with Fastolf on this occasion is among them. While the boy Scrope was still of tender years, Gascoigne purchased his wardship for a sum which may be calculated at about 3,500*l.* in our money. Nor was the minor's consent asked. A complaint is still extant in which Stephen says that the transaction took place in the very year of Fastolf's marriage with his mother. But within a short time we find him back again in the custody of his stepfather. Whether Gascoigne's disgrace on the accession of Henry V., or whether the loss of her sole remain-

ing child made the Lady Millicent wish for her son and persuaded her husband to grant her the favour, we cannot guess, but poor Scrope says, "He boughte me and sold me as a beste, against all right and lawe." He further enumerates a number of injuries and damages in goods and chattels which he had received from his stepfather, but the great point of the complaint is of a different kind. While he was away from home he received some bodily hurt, we cannot now say what, and if we interpret him aright he became a cripple for life, for he "took sykernes a xiiij or xiv yere's swyng, whereby," he adds, "I am disfigured in person and shall be whilst I live." He does not seem to have ever been knighted, and probably some deformity precluded him from carrying arms.

Stephen Scrope's grievances were destined to be of very long standing. Fastolf survived till 1459, and, having once grasped the estate, was in no hurry to let it go. Though his wife died thirteen years before him, he continued in possession during his life, for he had persuaded his stepson to sign a deed while very young, and probably unaware of the meaning of the act, by virtue of which he remained undisturbed, even refusing the young man's very reasonable request to have Castle Combe to farm. To have granted it would have been to interrupt the course of action on which he had early entered. During his tenancy of the estate he administered its affairs chiefly through a certain William, whose surname is a question, for he was called both Botoner and Wyrcester, a man not unknown to fame, of whom a full account is to be found in the Paston Letters and other places. To Fastolf he made himself very useful as steward, secretary, herald, and indeed factotum. Many documents in his handwriting have come to light lately, and are noticed by the local archaeologists. Wyrcester's administration is well illustrated by the fate of a sporting parson, one John Grene, who was fined forty marks for some depredations in the park, and by that of a predecessor of Grene's, who, with three other clergymen, was convicted of poaching, and duly amerced by the remorseless William. It is still a question whether Wyrcester, or Stephen Scrope's cousin, the Earl of Worcester, was the translator of Caxton's edition of "Tully." Another of Fastolf's most ready instruments was Thomas Howys, or Howis, who was also parson of Castle Combe. It is to Howis, then in Norfolk, that he wrote the letter quoted above. He became Sir John's executor, and persuaded him to leave some money for the repair of the churches on his estates; it is probably owing to this bequest that the Fastolf arms appear on the Castle Combe tower.

If Fastolf was hard upon Scrope in the matter of the estate, he was not more lenient in that of the wardship. He took him to France in one of his expeditions, but at Honfleur the young man fell into disgrace with the local authorities, and had the mortification of seeing Sir John take part against him. He managed to escape to England and took refuge with his mother; but it is very characteristic of Fastolf to find that he insisted on Scrope making a payment for his board at home, and at last turned him out of doors on account of his imppecuniosity. Soon after this Scrope married, in order, as was said, to find a home, but how marriage conduced to that end does not very clearly appear. Fastolf, perfectly consistent, now demanded his fine of 500 marks for his ward's marriage, and actually obtained the money after incessant importunity extending over many years.

A side light is thrown upon Stephen Scrope's character by a manuscript in the Harleian collection, of which Mr. Blades gives an account in his *Life of Caxton*. It is on paper, and consists of a translation of the *Dei Mores des Philosophes*, which in a different translation was Caxton's first book printed in England with a date. The paper is in poor condition, but part of the colophon is still legible and runs thus:—"Now late translatyd out of French tynge in to Englysh the yer of our Lord Mccccl. to John Fastolf knyght for his contemplancon and solas by Stevyn Scrope squyer some in law to the said Fastalle. Deo gracia." This dedication places Scrope in an amiable light; how the offering was received does not appear. By an amusing mistake Mr. Blades speaks of Fastolf as Sir John Fastolf Bart. He was a banneret, which may have led to the error, but it is one of the very few to be found in the book.

Scrope's marriage, or marriages, furnishes another curious example of Fastolf's disposition. One of the first of the Paston Letters is a request to his stepson to use his influence to corrupt a certain judge, his wife's father. Whether this was Sir William Yelverton or Sir Richard Bingham does not appear. Scrope was twice married, and each time to the daughter of a judge, and Fastolf wishes it should be delicately conveyed that a reward might be had by a perversion of justice.

At length, in November 1459, after an illness which lasted one hundred and forty-eight days, he died at Caistor. His will still exists at Magdalene College, Oxford, and some account of it and other documents relating to him occurs in the recent Report of the Historical Manuscripts Commission. It was made in June, therefore near the beginning of his illness, but was only proved by Paston and Howis, his executors, in 1467. Fastolf himself had taught them that possession is nine points of law, and they did not fail to make use of their knowledge. His wishes were never carried out as to the foundation of a college at Caistor, and much of his property was wasted in litigation as to the authenticity of a will "nuncupative," which he was said to have made on his deathbed. Two things seem certain—namely, that Stephen Scrope, by whose property he had so largely increased his own means, received nothing from him, and that Magdalene College, which has hitherto reckoned him among its benefactors, and still owns some lands

which once, were his, only obtained them by the adroitness of Bishop Waynflete, the rest of the estate going to Sir John Paston. As for Castle Combe, when poor Scrope at last came into possession he was already an old man.

THE CHURCH CONGRESS AT BRIGHTON.

THE Church Congress has fairly won recognition as an element in the English Church system existing under an informal charter, and wielding nothing more tangible than influence, but at the same time meeting wants which a more precisely organized body might perhaps be too inelastic to supply. Each Congress must accordingly be judged by the wisdom shown in the selection of its subjects, the ability with which they are treated, the representative character of the gathering, and the numbers and tone of the audience which listens to the discussions. We cannot complain of the one which has just concluded at Brighton in any of these particulars. In the matter of numbers it was larger than any of its predecessors. It has also set a good example to all which may come after it in the general toleration which every party has shown for the very decidedly pronounced opinions of persons with whom for the rest of the year they are in their respective Unions and Associations in a condition of chronic warfare. There was indeed one storm when an indiscreet county member broke in upon a peaceable and solid debate on the constitutional character of Convocation with a stump appeal to that body to sweep out of the rubrics everything which the gallant representative for West Sussex was pleased to think Romanizing, or be for ever fallen. But Colonel Barttelot had only himself to blame for the disturbance. Not only were his remarks barely within the question by a strained interpretation of its wording, but they came from a member who had made himself prominent by the heat with which he had supported the Public Worship Bill, and were addressed to a meeting partly composed of those who, being his constituents, had no taste for being so lectured, and partly of those who, not being his constituents, resented seeing the Church Congress turned into the hustings for Sussex. His outburst was accordingly accepted as a challenge to Archbishops and aggrieved parishioners to make the Act as vindictive in its operation as possible, and was received accordingly. A second storm which had nearly broken out on a similar provocation was nobly allayed by the Bishop of Chichester bespeaking a hearing for the speaker—a clergyman whose antecedents ought to have saved him from so false a position—on the ground that he seemed to be “now” approaching the question. Those whose love for the Church of England and its Congress was of the negative order exulted over these passing gusts as hopeful signs of an immense tempest on the following morning, when the discussion of the fabrics and the services of the Church in relation to the wants of the times could so readily be turned into a free fight over the Public Worship Act. These prophets of ill were signally disconcerted by the result, for although the vast Dome of the Pavilion was crowded with the hot spirits of both sides, the discussion went off in perfect good temper, with no references to the irritating Act, and with just so much divergence of views as to make it lively. The speaking, which was preponderantly on the side which is desirous of maintaining the more ceremonious character of English worship, very conclusively showed that any attempt under the Bill of the Archbishop, or of any other man, to enforce a dead level of puritanical austerity in our congregational devotions could only result in a bitter conflict, out of which the Church itself could hardly emerge as an Establishment.

The keynote of harmony had no doubt been very happily struck at the first of the meetings, for which a subject was wisely chosen well calculated to take the thoughts of the members present out of their purely insular troubles and disputes. The Old Catholic movement was the topic selected, and the Conference at Bonn, although it had come off subsequently to the selection of the subject, very naturally gave the tone to the speaking. It was indeed noted with regret that some who had been present there, particularly the Bishop of Winchester and Professor Mayor, might have advantageously spoken more directly upon the details of the incident, in preference to falling back upon the general question, about which we know so much already. Still the discussion was valuable, if only as eliciting the sympathies of Englishmen on grounds of a cognate Churchmanship with the first Continental movement which has ever within their memory thrown off the burden of Ultramontaniam without at the same time repudiating the salutary restraints of a traditional organization. The solitary protest which the Bishop of Melbourne made against the general expression of feeling, on grounds of a puritanism which was so narrow as almost to be old-fashioned even in the mouth of a votary of Exeter Hall, only threw into higher relief the genuine sympathy of those who were present for the Old Catholic cause.

There was much lively talking one morning upon the question of patronage, out of which three conclusions might have been drawn—that the actual system of patronage was liable to many objections, some theoretical and others practical; that it was much easier to put one's finger on these objections than to show any feasible way of meeting them; but that of all conceivable remedies the very worst would be one which should weaken or destroy the existing system of private patronage, under which the clergy of England have neither sunk into ranting demagogues nor been in-

flated into a sacerdotal caste. The debate upon Convocation, which was supplemented by one upon Diocesan Conferences, had the advantage of being started by writers—Lord Alwyne Compton and Canon Trevor—who had acquired a wide practical knowledge as leading members of the body of its history and working; and, with the exception of the unlucky interruptions to which we have referred, it kept up its character. Advocates were not wanting to argue that it was the duty of that ancient representation of the clergy to commit the suicidal process of converting itself into a mixed assembly of clergy and laity, in hopes of purchasing immediate popularity at the price of forfeiting its ancient constitutional character. The balance, however, of argument demonstrated that while the internal balance of clerical interests in Convocation might well be readjusted, and while it was highly expedient that the laity should obtain, wherever possible, additional facilities for making their opinions felt and their voices heard, yet there was no sufficient cause why the clergy should be deprived of their one opportunity of considering their own affairs on their own responsibility. In the meanwhile it struck some of the speakers that, while theorists were busying themselves to devise opportunities for lay co-operation and something like lay legislation within the Church, the thing had been quietly but rapidly creating itself in that network of diocesan conferences which is overspreading the land, and out of which might possibly be evoked some central body in correspondence, though not amalgamated, with Convocation.

Among the most remarkable of the papers which were read at the other meetings was one by Professor Pritchard, who, in fully and enthusiastically dwelling upon the marvels of modern discovery, most earnestly protested against the narrow and unphilosophical vanity which busies itself with seeking, among the multiplied instances of an all-wise and all-powerful First Cause, for arguments in favour of a vague and hopeless materialism. The topic might be challenged as not within the direct objects of a Church Congress, but the diversion was well timed. The antagonism between religion and science, between faith and discovery, is the fount not of the thoughtful Churchman nor of the real philosopher, but of the men with whom theorizing is chiefly valuable as it ministers to the importance of self; and therefore the sooner and the more completely it is dissipated by thinkers whose authority to think will be acknowledged alike by the votaries of religion and the students of science, the better it will be for both causes.

We are told that next year the Congress is to reassemble at Stoke-upon-Trent. It was certainly a bold act on the part of its managers to suggest to a mixed multitude fresh from the gilded saloons of the Pavilion, full of the Aquarium and the breezy idleness of the beach and the piers, that they should adjourn to the reek and cinder-heaps of Hanley and Longton. The fact that the proposal was not only made but cheerfully accepted shows that the frequenters of the Congress do not avail themselves of it as a mere excitement for the autumn. The choice of Stoke was, we think, wisely made in the higher interests of the body for whose benefit the Congress exists, for it is a place in which Churchmanship is carrying on an uphill fight with Dissent in every form. The exhibition in such a community of the Church as a large and complex corporate institution, with interests and pursuits founded upon its own definite principles, but yet co-extensive in their aims with the nation and not with any single sect, cannot fail to produce an impression which will be as beneficial as perhaps it may be novel.

THE ABOLITION OF SECOND CLASS.

IT is easy to understand the process of reasoning which has probably led the Midland Railway Company to the determination to abolish second-class carriages, but it may be doubted whether the experiment is not, at least at the present moment, rash and inconsiderate. The effect of the recent large extension of facilities for third-class traffic has naturally been to empty the second-class carriages. In point of accommodation there is extremely little difference between a second and a third-class carriage. The only real advantage of the former is that it usually enables travellers to avoid the rough companionship to which they are occasionally exposed in the lowest class of all; but many persons are tempted to run this risk for the sake of what on a long journey is a substantial economy. It appears that between 1870 and 1873 the number of railway passengers in England and Wales has increased by much more than a third, and the passenger receipts by more than a fourth, and almost the whole of this increase occurs in the case of third-class traffic. The first class remains almost stationary, the second class steadily declines, while the third class grows with astonishing rapidity. It is evident, therefore, that what the second class has been losing the third class has been gaining; and the question which the Midland, like other Companies, has had to consider is how to win back the second-class passengers who are thus slipping away into the third class. The most obvious way in which this might be done would be to make the second class cheaper and more attractive, and thus tempt passengers to pay something more than third-class fare for the sake of a more select and comfortable carriage. Before abolishing the second class it would surely be worth while to see what can be got out of it by managing it in a rational way. As a rule, second-class traffic has never had justice done to it. The higher fare which is charged for it is out of all proportion to the difference in accommodation between second and third class, and the consequence is that the second class is used only by persons who cannot

afford the highest price, but who shrink from the unpleasant contingencies of the lowest. The reason why the Companies have not done more for this neglected class is no doubt that they were afraid of thereby losing first-class passengers; but it is quite possible to make the second class more tempting, while leaving a wide margin of luxury and exclusiveness for those who are willing to pay the highest price of all. The arrangement which is proposed by the Midland is represented as a boon to second-class passengers, and to some extent it is so. They are told that they will be enabled to ride first class for rather less than what they now pay. As, however, return tickets are to be abolished, it is possible that the fares will practically not be less than at present; and all that second-class passengers will thus obtain will be the increased dignity and comfort of sitting in first-class carriages. This, however, is not what, as a rule, passengers of this grade are anxious about. What they really want is plain accommodation at a cheap rate, which shall yet be somewhat higher than the fare of the class in which roughs and vagrants necessarily travel. On the other hand, it can hardly be doubted that the threatened change will not be welcomed by the present first-class passengers, the majority of whom would certainly much rather pay the existing fares, or even more, and be left to stretch their legs at ease in a moderately-filled compartment than be packed closely and hotly together at a lower charge. The luxury of first-class travelling chiefly consists in having a liberal allowance of room; and if people are willing to pay more for this sort of exclusiveness, it is hard to see why they should not be indulged. It has been justly remarked that the abolition of the second class will practically mean the suppression of the first in the sense in which it has hitherto been understood; and this seems to be a very wanton and perverse arrangement. The Midland Company no doubt hope by reducing the carriages to two classes to tempt a large number of the passengers who have forsaken the second class for the third to travel first class, and this may probably be the result. But the same financial result might be obtained by lowering the second-class fares, and keeping the first-class as it is. In this way the former would be really benefited without the latter being disturbed.

There is, of course, no reason why a Railway Company should not from time to time revise its charges, under such limitations as Parliament has imposed, with a view to increase its revenue, and there is certainly no restriction on a voluntary reduction of fares. It will be observed, however, that the change which the Midland Company is about to make is not merely a financial, but to some extent a social, revolution. It is natural that the arrangements for the accommodation of the public should correspond to the actual composition of society; and nobody can doubt that there are three distinctly marked classes to be provided for on the railways. There are the people to whom the expense of a journey is comparatively a matter of indifference, and who are anxious to obtain the most luxurious accommodation, without regard to price; at the other end of the scale there are those who must of necessity travel at the lowest possible outlay, no matter how poor the accommodation may be. Between these two classes there is a third, composed of persons whose means will not justify them in spending money on pure luxury, but who yet can afford to pay something more than the lowest fare for the sake of a little more comfort, and especially of more select company. The existing arrangements of the railways are adapted to these familiar social divisions, and there is surely a foolish wantonness in attempting to ignore or to repudiate them. Mr. Gladstone a short time since recommended the plan which the Midland Company are about to adopt, on the ground that his financial experience led him to the conclusion that "the State, or individual, or Company thrives best which dives deepest down into the mass of the community, and adapts its arrangements to the wants of the greatest number." This is one of those large, vaguely expressed theories in which Mr. Gladstone delights. In one sense, it may be supposed to mean that a public Company should not concentrate its attention upon one class of society, but should endeavour to provide equally for all. In another sense, it might seem to imply that the Company ought to devote itself exclusively to meet the particular wants of the largest class of the community, and leave other classes to take their share of this provision or go without. It is on the latter principle that the Tramway Companies have apparently been allowed to monopolize a number of important thoroughfares in London and in other towns. The tramway-cars are no doubt largely patronized by what may be called the "mass of the community," and consequently the roads are given up to them, and other people who may desire a more rapid or independent mode of conveyance are practically excluded. However desirable it may be that the poorer classes should have the advantage of cheap locomotion, it is obviously carrying the principle too far to limit other classes to the same means of transit. In the United States the sacred principle of equality of citizenship requires that there shall be only one class of carriage on the railways, although in practice the rule is evaded by various expedients. On the Continent there is a familiar saying that only fools and Englishmen travel first class; but after all this is a very innocent kind of folly, and if the fools are willing to pay for it, it is difficult to see why they should not be allowed to do so. There is no doubt a great deal of what may be called snobishness on the part of a large section of first-class passengers. It is supposed by many persons to be a badge of social distinction to travel in this way. It is, in fact, one of the ways in which small people can for the time put themselves on a level with big people. There is nothing above

the first-class express except a special train, and special trains are the privilege of princes and railway directors. In the train, therefore, a sort of equality with great folk may be established at a very moderate cost. There is a sweet satisfaction to some minds in reflecting that, for a little while at least, they are in as distinguished a position as it is possible to attain. It is not everybody who can live in Belgrave Square or drive as good horses as a colliery-owner or a duke; but the first-class carriage is within reach of many people, and first class, while the train runs, is top of the tree. In a country like England there are always a considerable number of people who are only too glad of an opportunity of spending money if they can only acquire some sort of distinction by doing so, and it is difficult to discover any reason why the Railway Companies should not make a legitimate profit out of the weaknesses of human nature. It is not particularly the business of the Midland Company to put down snobishness or exclusiveness. Its principal duty is to earn a good dividend for the shareholders, and it is more likely to succeed in doing so if it accommodates itself to the natural habits and convenience of the public than by attempting to coerce its customers into a fantastic equality.

There are special reasons in the nature of the traffic on the Midland system which have no doubt influenced the decision in regard to the abolition of second class, and which do not operate to an equal degree in the case of other Companies. The third-class receipts on the Midland are not far short of a million, and the first-class only 210,000*l.*, while the London and North-Western derives three-quarters of a million from its first-class traffic and a million and a half from the third. It is only natural, therefore, that the Midland Company should attach comparatively little importance to their first-class traffic, and should endeavour to get rid of the trouble of it as far as possible by amalgamating it with the second. To some extent the course upon which the Midland are about to enter must, if persisted in, have an influence on the arrangements of other Companies; but it is scarcely probable that the example will be generally followed. The wisest policy which a Railway Company can pursue is, not to devote itself exclusively to the cultivation of one description of traffic, but to endeavour to afford equal facilities to all. There is no reason why travellers should be arbitrarily limited to a choice between two kinds of carriages any more than to a uniform rate of speed. Some people like to travel quickly, others are content to go slowly; some set their hearts upon soft cushions, while others are satisfied with hard deal boards; some think only of comfort, others only of price; and it would seem to be the business of a Railway Company, as of any other purveyor, to endeavour as far as possible to suit all tastes. Perhaps if there is one thing more than another which the public is anxious about at the present moment, it is neither extra cushions nor cheaper fares, but greater safety; and the Railway Companies would do well for themselves in making such arrangements as would produce a more comfortable feeling on this point.

A DAY WITH THE FUNGUS-HUNTERS.

ANOTHER fungus feast, and no casualties! Once more have the mycologists, indigenous and other, hunted and harried the woods, fir-groves, and pastures of Herefordshire in pursuit of game which squires do not care to preserve, and to which farmers do not raise the faintest objection. Once more have they returned towards dusk to the "faithful city," bearing bags and baskets filled with spoil destined to give variety to more than one cuisine. So far has the adoption of the study of mycology, as a special feature of the Woolhope Field Club transactions, tended in six years to "Italianize" the tastes of diners-out in the matter of fungi, that we believe the excellence of a "Lycoperdon" fritter might be avouched by the highest ecclesiastical dignitaries; and, unless our eyes deceived us, the High Sheriff of the county of Hereford could certify the goodness of "Conatus" soup. It is not of course contended that among the results of the forays which made the woods of Downton, Stoke Edith, Dinmore, and Garmsdon all alive in the first week of October there were not a number of diverse toadstools, wholly unfit for human food; but a residuum of edible fungi was tried, tested, and not found fault with by the guests at the public dinner on the first of the month, who, though disappointed of the presence of the Rev. M. Berkeley, the chief of English mycologists, included in their number those scarcely less eminent authorities, Messrs. Broome, Rennie, and Houghton, to say nothing of that skilful delineator and describer of fungus-growths, Mr. Worthington Smith, F.L.S. The proceedings of the evening included a merited recognition of the assistance rendered to the Club by this gentleman, whose two sheets distinguishing edible from poisonous fungi, with the key appertaining to them (published by Hardwicke), are still the most useful guide to the amateur fungus-hunter, though for more advanced inquirers the manuals of Berkeley and Cook, and, for the more classically minded, the charming volume of Dr. Badham, are doubtless more suitable. The delicately-served Marasmius oreades, or "Fairy Ring Champignon," enabled the veteran Mr. Lees to return for the hundredth time to his "molar" theory as to fairy rings; the orange-milked mushroom (*Lactarius deliciosus*) justified its title, after skilful cooking and a good deal of salting and peppering; and if on this occasion we failed to experiment upon the scaly agaric (*Procerus*), the beefsteak that is cut to order from half way up the oak (*Festulina hepatica*), or

the *Boletus edulis* (not that in favour with the elder Roman gourmands, though very popular with their remote posterity), or even the Giant Puffball (*Lycoperdon giganteum*), it is simply because, in the case of fungus-tasting as in everything else, "non omnia possumus omnes." The *Lactarius deliciosus* ought to be good, to judge from its name; and its beauty of colouring and deep orange milk so completely distinguish it from the dangerous *L. torminosus*, the deadly and ruddy *L. rufus*, the fragrant and rare *L. glycosmus*, *L. controversus* (a species not uncommonly found under the black poplar, but on this occasion discovered by Dr McCullough under a Lombardy poplar at Garnstone), and the *L. Vitellinus*, which, notwithstanding its epithet, is not good for food, that there need not be the slightest hesitation in tasting it, even raw. Dr. Badham's plan of baking the *Deliciosus*, after due application of salt, pepper, and butter, for three-quarters of an hour in a covered pie-dish, is doubtless a preferable mode of experimenting on this delicacy. Our own experience of it is not so fortunate as to enable us to rank it with the most appetizing of culinary fungi, nor can we mention it in the same day with the slices of the Giant Puff-ball when, after the removal of their outer integument, they are dipped in yolk of egg, and then fried in fresh butter. In all such experiments it is obviously unfair to try other than quite fresh and young specimens, and there ought to be no necessity for cautioning even the uninitiated against cooking the puff-ball when it is yellow and rotten inside, or indeed when its snow-white exterior is beginning to change to a suspicious yellow. Several of the rarer *Lactarii* mentioned above were either found in this year's forays at Hereford or were brought thither to adorn the sideboard at the festival.

A word must be added about the "*Comatus*" soup. What boy or girl accustomed to roam over field and pasture does not know the quaint cylindrical "tall John," with a fleshy and patchy white wig, and a hollow stem with a white powdery fragile ring encircling it, known to mycologists as the "*Coprinus comatus*," and sometimes as the "*agaric of civilization*"; but hardly less familiar to hundreds who cannot put a name to it, and who come across it and its grey-capped cousin *C. Atramentarius*, in the open garden or at the base of stumps or palings? This fungus has long been mixed with others in the composition of ketchup, and *Atramentarius* is said to make very good ink. It has been reserved for the Woolhope Club to demonstrate its value as the principal ingredient in a piquant and tasty soup, to outward appearance resembling green-pea soup, or perhaps more closely parsley and butter in a tureen. Whatever its semblance, it is too good an addition to our list of soups to be lightly forgotten; and perhaps the day will yet come when those philosophers whose mental grasp can embrace nothing higher than the addition of another and another novelty to their gastronomic pleasures may learn to count amongst their benefactors the motley group of mycologists whom an inscribed festoon in one of the streets at the recent opening of the Free Library at Hereford designates irreverently and illiterately as the "*Fungi Fogies*." After all, however, even putting the question of edibility aside, it is not difficult to find good reasons for prosecuting the study of mycology. Medicinally and industrially many fungi have their special purpose, as for instance the scaly *Polyporus*, which, dried and cut into strips, supplies a capital razor strop, and the other species of the same group which are manufactured into the styptic known as *Amadou* or German Tinder. The medicinal substance known as *ergot* of rye has also, it need hardly be said, a fungoid origin. Generally, too, to quote the highest English authority on the subject, "the office of fungi in the organized world is to check exuberant growth, to facilitate decomposition, to regulate the balance of the component parts of the atmosphere, to promote fertility, and to nourish myriads of the smaller members of the animal kingdom." Regarded in this practical light, the numerous family of *fungus* asserts a strong title to intelligent study, and cannot lightly be overlooked by any Field Club that deserves its name. An attempt to catalogue the fungi which line the woodland path, or have their habitation at the foot or amid the branches of the oak, ash, elm, the larch and fir, the birch and the poplar, would very soon more than exhaust our paper. Amidst the things of beauty—though certainly not of joy to the incautious taster—in fungus life may be cited the *Boletus luridus*, amber-coloured above, and bright red or even vermilion below, and suspiciously changing, when broken or bruised, to a blue complexion. Or, again, the Fly Agaric (*Agaricus [Amanita] muscarius*), with its bright scarlet cap, worked, so to speak, with yellow or yellowish spots, and underlaid with a bright yellow flesh, which is succeeded, lower still, by a pervading white. Its stem is bulbous and marked by a distinctive ring. The *Peziza aurantia* is another perfectly lovely tenant of the woods and heaths, a delicate crisping "lamina" of the brightest orange, which no one will forget who saw the other day a specimen of it, measuring eight and a half inches across, sent from Shobdon Court by Lord Bateman. Amongst the *Russulas*, found freely this year as usual in Herefordshire, there is as great a variety of hue as of wholesomeness, from the pale pink and faint rose to the brilliant scarlet of *R. emetica*. *Cortinarius cinnabarinus* is a clustering group, of a bright orange or nearly vermilion, with a metallic lustre. The Cinnamon Mushroom (*Cortinarius Cinnamomeus*) appeals to the sense of smell as well as of seeing, and there are several fungi of which the recent expedition furnished specimens which make the former appeal without any pretence to the latter. Before glancing at these we must just name the violet-capped *Agaricus euchrous*, found at Dinmore Woods on

the 30th of September; the *Coprinus picaceus*, or *Maggie Coprinus*, a rare roadside fungus met with near Downton, the membraned cap of which is variegated with broad white scales, whilst its gills are free and of an ashen black; the mouse-grey *Agaricus gloiocephalus*, of which a large group was exhibited by Dr. Chapman from off the pastures of Burnhill; and the rare, pale-yellow, crisped *Sparassis*, which has been more than once imported into these shows from the fir-groves of Chetwynd by Mr. Houghton. We must also say a word on the odorous fungi, whether sweet-savoured or the contrary. Of the first sort there were found at Stoke Edith *Lactarius glycosmus*, and *Agaricus fragrans* and *odorus*; of the second, at Dinmore, the *Agaricus cucumis*, in an abundance commensurate with its strong odour, suggestive of rancid oil or stinking fish. *Ag. saponaceus*, too, was offered to our scrutiny, but pronounced, after deliberation, to savour more of fish oil than of soap; and the interest displayed in Dr. Chapman's fine group of *Gloiocephalus* was to a certain extent qualified by its exceedingly repulsive smell. Occasionally in the course of the forays one lighted on a family of fungi, such as *Agaricus mucidus*, the associations of which are more with the touch than the sight or smell. Unpleasantly slimy, it arrested the notice of the Woolhopians by its profusion at a certain point in Stoke Edith woods, both on the ground itself and on the tall fine grown beeches, which are its home.

The mention of these silvan beauties suggests another element of interest in fungus-hunting—namely, the introduction it gives one to the finest timber in our land. As we have said, the fungi love the greenwood. And if, in the recent excursions around Hereford, the curious in such matters were too late by a couple of centuries to see at Stoke Edith the Elizabethan house of many gables, long since superseded by the present stately quadrangular mansion, or at Garnstone the original and characteristic mansion as it appeared in 1675, and was represented in Dingley's sketch, known to readers of the Camden Society's publications, in the place of which is a castellated mansion built by Nash, yet in each case they might have made acquaintance with giant oaks and stately elms which perchance have been the silent witnesses of changes yet earlier than these; oaks and elms still betraying no traces of decrepitude, and still, as of old, giving grace, dignity, and picturesqueness to the landscape. It is not every day that one sees anything so perfect in its way as the great hall at Stoke Edith, the walls and ceilings of which were painted by Sir James Thornhill, or as the geometric flower-garden designed by Nesfield; and yet an explorer might be still better employed in threading the paths of the richly timbered deer-park and making his way to the broad and lofty ridge of Seager Hill, whence he may look out upon the country towards Gloucester, Monmouth, Abergavenny, Bromyard, and Salop, to say nothing of the hill and valley of Woolhope nestling close beneath his standpoint. And so with the demesne of Garnstone; the predominant charm is in the deer-park, and the heights that bound it, the latter commanding exquisite views of North and East Herefordshire, as well as of Shropshire and the mountain barriers of Radnorshire, the former affording a study of single trees and clumps and groups of extreme beauty, such as is not often to be met with. Here a couple of Scotch firs, there a noble spruce or silver fir, arrest the eye by their perfectness of symmetry or their rich contrast of form and colouring with their surroundings. Groups of Spanish chestnuts, clumps of elms, or avenue-like arrangements of the same, promising Wellingtonias, and the like, show how much good taste may achieve, without the aid of a professional landscape-gardener, where the proprietor finds himself possessed of an over-abundance of fine timber, and approaches the task of thinning as a labour of love. Within the lawn and sunk fence at Garnstone, the mycologists were as much struck with the thriving conifers of comparatively recent introduction as with the special denizens of the turf in quest of which they had come. There were perfect samples—for their age—of the *Picea Nobilis*, *Cephalonica*, and *Pinsapo*, as well as of the Californian *P. bracteata*, the leafy-bracted silver fir, a very promising young tree, which, perhaps on account of a well-chosen aspect, shows here no tendency to premature starting into growth, and thus is less affected by late spring frosts. The complaint of this species generally is the tenderness of its younger growths.

REPORT OF THE UNIVERSITIES COMMISSION.

THE Commissioners appointed to inquire into the property and income of the Universities of Oxford and Cambridge and the Colleges and Halls therein have made a complete and business-like Report. The landed estates held by these corporations in England and Wales amount to 319,718 acres, situate in the Southern more than in the Northern counties. We turn with interest to the remarks of the Commissioners as to the management of these large estates. The quantity of land let on beneficial leases is still large, but this tenure is not now so common as it was in former years. The Colleges, like other corporations, have in many cases determined to run out their leases. The existing members have thus sacrificed themselves for the benefit, as is commonly, but not always accurately said, of their successors. In some cases of hospitals the prospective benefit is so large that it may be assumed that the successors of the present incumbents will not be permitted to enjoy the whole of it. However, the income thus arising is likely to be devoted to purposes of education or

charity, and in this sense the existing societies may be said to have sacrificed themselves for the benefit of their successors. The system of beneficial leases has been handed down from the earliest times of the Colleges, and it might probably be shown to have been well suited to the times when it originated. The College or other corporation got in this way money down instead of having to extract it year by year from the tenant, and this may have been formerly an important consideration. But the Commissioners are doubtless right in saying that "at present the system of beneficial leases is detrimental to the pecuniary interest of the foundations." The Commissioners were informed that on the falling in of beneficial leases a large outlay on buildings and other improvements is ordinarily required. The lessees are for the most part under covenants to maintain and repair, but much more is needed at the present time for agricultural estates than what these covenants would enforce. The estates let at rack rent are "reported" (that is, as we understand, by the corporations making the returns) "to be generally in good condition as regards buildings, drainage, and cottages." The Commissioners "have no reason to think that they are below the average in these respects, although there is apparently less outlay than is made by private landlords who improve their properties." The cost of management of these estates appears to the Commissioners "remarkably low." On the whole income it averages only 2*l.* 15*s.* 10*d.* per cent. But the item "charge for management" does not generally include the salary of the financial officer, usually called the "bursar." On the efficiency of management the Commissioners "can form no opinion beyond the general results which are exhibited." But they observe that "the average lettings," the absence of arrears, and the apparently small amount of losses from tenants, testify to the care and vigilance of the bursars. It may be supposed that the Colleges are generally good landlords. Not long ago a case came before a court of law in which it appeared that, an estate being in the market, the tenant made active, and as it turned out successful, efforts to induce a College in Cambridge which had property in the neighbourhood to become the purchaser.

One point, say the Commissioners, is brought prominently out in the result of their inquiry. This is "the great disparity between the property and income of the several Colleges and the numbers of the members." They remark that when that number is small the expense of the staff and the establishment is necessarily large in proportion. But they do not consider that it lies within the scope of their commission to enter further upon this subject, which, we may add, is likely to be industriously pursued by commentators upon their Report. The strongest case of disparity between income and members is probably that of All Souls College, Oxford, which consists of the Warden, 27 Fellows, and 4 Bible Clerks, who are the only undergraduates. The income of the College is about 18,000*l.* a year, and during the next twenty years an increase of nearly 5,000*l.* a year may be expected through the running out of beneficial leases. The principal item of present expenditure for extra-collegiate purposes is the sum of about 1,700*l.* a year paid to University professors. The annual value of an M.A. fellowship is about 273*l.* The expected increase of income is calculated, as we understand, without reference to the fact that during the next twenty years the existing society will be deprived of the fines which would have been payable if the leases proposed to be run out had been renewed. The income of Merton College is upwards of 17,500*l.* a year. There is a Warden, and there are 23 Fellows, and 54 undergraduates "paying tuition fees." It should be explained that, although we use the present tense in quoting from these returns, they refer to the year 1871. The income of Oriol College is upwards of 16,500*l.* There are the Provost and 17 Fellows, and the number of scholars and commoners is 49. The income of New College is upwards of 30,000*l.* a year. It has a Warden and 39 Fellows, and 75 undergraduates. It pays 3,000*l.* a year in scholarships. It appears that upwards of 28,000*l.* has been borrowed by this College "for the purpose of recouping existing beneficiaries for fines receivable on renewals of leases, but not received." The estimated increase of income from the falling in of leases will be by the end of the century nearly 10,000*l.* a year. The College states that a very large expenditure will be incurred for many years to come both for repayment of "fine loans" borrowed and for the purpose of putting into a proper state of repair the estates which will fall into hand. At Cambridge we find that the income of King's College is upwards of 34,000*l.* There are the Provost and 49 Fellows, and the number of undergraduates varies from 22 to 31. The College pays 1,500*l.* a year to scholars and exhibitors. The income of St. John's College is close upon 50,000*l.* There are the Master and 56 Fellows. The College pays nearly 7,000*l.* a year to scholars, exhibitors, &c. The number of undergraduates paying tuition fees is 302. The income of Trinity College is close upon 60,000*l.* a year. There are the Master and 52 Fellows. The College pays upwards of 3,000*l.* a year to scholars and exhibitors. The number of undergraduates paying tuition fees is 446. At Pembroke College the income is upwards of 13,000*l.* a year. There are the Master and 13 Fellows. The number of undergraduates paying tuition fees is 55. This may be taken as a parallel from Cambridge to the case of Oriol College, Oxford, where, as we have seen, the income is 16,500*l.*; there are 17 Fellows, and less than 50 undergraduates paying tuition fees. Another feature of similarity is that each of these Colleges pays nearly 1,000*l.* a year in scholarships and exhibitions. We need hardly remark that it would be a mistake to estimate the utility of a College by the proportion which the number of its undergraduates bears to its

revenue. In past years Oxford has been influenced in a remarkable degree by members of Oriol College, who probably would not have been attracted thither if there had not been fellowships to elect them into. Pembroke College, Cambridge, produced men of high academical distinction at a time when its numbers were certainly not larger than at present. We turn to the *Cambridge University Calendar* for 1853, which happens to be at hand, and we find that it shows only twenty-eight undergraduates at Pembroke College. Yet at that time the College counted among its Fellows Professor Stokes and Dr. Haig Brown, now Head-Master of Charterhouse, who were undergraduates of this "small" College. It appears from the Report that the Heads of nineteen Colleges in Oxford receive 30,000*l.* a year, and the Heads of seventeen Colleges in Cambridge receive 20,000*l.* a year among them. The whole amount paid to Fellows in Colleges in each University is rather over 100,000*l.* a year. The sum paid to scholars and exhibitors out of the corporate income of the Colleges is in each University about 25,000*l.* a year. We give round figures as sufficiently accurate for comparison, and it will be seen from these figures that there is no great difference between the two Universities, either in principle or practice, in the application of their revenues.

Among the matters which the Commissioners regarded as beyond the scope of their powers were several which will be eagerly discussed by commentators on their Report. On one point the Commissioners make no observations of their own, but they desire to call special attention to some "general observations" contained in the answers sent by University College, Oxford, to their queries. The "prevailing opinion" of that society is stated to be that any surplus due to an increase in the available resources of the College, after providing for the adequate remuneration of College officers, and for necessary improvements in College buildings, should be applied towards, we will say for shortness, exhibitions and professorships. It is easy to make "general observations" of this kind, and the only difficulty lies in reducing them to practice. We must, however, give due praise to the Commissioners for having resisted the temptation to discourse on this and other inviting topics in their actual Report. They have not, like other Commissioners and compilers of Blue Books who could be mentioned, taken occasion to print and publish essays on things in general at the national expense. We find in the Appendix a quantity of papers detailing the steps taken by the University of Cambridge to provide lectures and examinations for certain large towns which applied to it for assistance. This interesting and laudable enterprise appears to us to be a matter with which the Commissioners have nothing whatever to do, unless they could be considered bound to receive from Fellows of Colleges statements tending to show that these Fellows do more or less useful work for their pay, and that would open a very wide and difficult inquiry.

A memorial addressed to Mr. Gladstone sets forth the views of numerous resident members of the University of Cambridge as to the tenure of fellowships, and Mr. Gladstone states in his answer that he is pleased to find that a principle included in the Oxford University Bill of 1854 is supported by this "authoritative judgment." The next paper in the Appendix is the Report of a Committee appointed by New College, Oxford, to consider the application of its revenues. The Report, which bears date 4th June, 1873, mentions several purposes which College fellowships should serve—namely, College teaching and management, University teaching, the encouragement of education, and the encouragement of mature learning, and the Committee proceed to submit to the College a scheme for carrying these purposes into effect. These papers and others indicate anxiety to show that Colleges are sensible of their duty to make the best of their revenues for the advancement of education and learning; but they seem rather to invite the Commissioners to advance beyond their proper province. The Commissioners resisted this temptation, but it is possible that some other Commission hereafter may be less scrupulous.

The complication and variety of systems in the accounts of the Colleges renders it difficult to derive any general results from them without risk of error. The total income of the Universities and Colleges in the year 1871 is stated to have been 754,000*l.*, of which 665,000*l.* was for corporate use, and 88,000*l.* was subject to conditions of trust. It may be said roughly that, of the total income held for corporate use, the share of Oxford is to that of Cambridge as 6 to 5. The revenues arise from two different sources—first, the properties, and secondly, the room rents, dues, and fees paid by members. The former of these is called by the Commissioners external income, and the latter internal income. There is more liability to dispute or error in calculating the latter than the former. But in the case of Christ Church, Oxford, we find an item "loans raised to meet current expenditure, 9,765*l.* 5*s.* 0*d.*," added to the income from "external sources"—that is, lands, houses, &c. A hasty reader might infer that Christ Church has nearly 10,000*l.* a year more of landed property than it actually has. It must be remembered, too, that the cost of repairs, of collection of rents, and of insurance, has not generally been deducted from "external income." We must, therefore, be careful not to form hasty conclusions from the mass of valuable accounts which this Commission has collected.

THE LAW OF COMPENSATION.

MUCH attention has been and will be directed to the question whether compensation can be recovered by the sufferers in the Regent's Park explosion, and, without entering upon discussion

of the facts of that particular case, it may be useful to endeavour to ascertain the principles by which such a question must be decided. With this object we propose to refer to a case in which a Railway Company was held responsible for damage caused by fire kindled by sparks from a locomotive engine. It was conceded in that case that the defendants' engine was of the best construction, and that there was no negligence in the mode of working it, but it was contended, and the Court agreed, that the defendants were bound to take notice that such engines do emit sparks and burning cinders, and as they were driving those engines through the country in an exceptionally dry season, they ought not to have permitted combustible materials, such as hedge-trimmings, to remain on the banks of their railway. A learned judge, who went thus far with the majority of the Court, declared his own opinion that no reasonable man could have foreseen that the fire would consume a hedge and pass across a stubble-field, and so get to the plaintiff's cottage at the distance of two hundred yards from the railway, crossing a road in its passage. "It seems to me," he said, "that no duty was cast upon the defendants, in relation to the plaintiff's property, because it was not shown that that property was of such a nature and so situated that the defendants ought to have known that by permitting the hedge-trimmings to remain on the banks of the railway they placed it in undue peril." If that had been shown, then he thought that the principle of an earlier case would have applied; "for then the defendants must have been taken to have known that the course which was pursued by their servants was calculated to endanger the adjoining property."

This judgment was delivered in 1870, and we take it as fairly indicating the sort of test that would be applied to a claim by a householder in Regent's Park for compensation. Must the Canal Company be taken to have known that the course which was pursued by its servants was calculated to endanger adjoining property? Assume that the Canal Company was not only entitled, but bound, to carry gunpowder under reasonable precautions. A Railway Company is not only entitled, but bound, to drive engines through the country; and, as was said by one of the judges, "the mere circumstance of the fire being caused by an engine of the Company is not enough to give a cause of action against them, but the plaintiff must show some breach of duty on their part which occasioned the injury he complained of." The Court, said the same judge, must look at all the circumstances occurring at the time of the accident to see if there is anything to found a charge of negligence. It is clear, said another judge, that when a Railway Company is authorized by its Act of Parliament to run engines on the line, and that cannot be done without their emitting sparks, the Company is not responsible for injuries arising therefrom, unless there is some evidence of negligence on its part. Then comes the question, is there evidence in the case of a want of reasonable care? It could hardly be negligent not to provide against that which no one would anticipate. But "if the Company strewed anything very inflammable, such as, to put an extreme case, petroleum along the side of the line, they would be guilty of negligence." Another judge, in reference to the alleged dryness of the season, said, "It seems to me that the more likely the hedge was to take fire, the more incumbent it was upon the Company to take care that no inflammable material remained near it." Thus after much discussion before two Courts, and many doubts expressed by various judges, it was decided that there was evidence for the jury of negligence on the part of the defendants which caused the injury complained of. It may be generally assumed in these cases that the jury would find a verdict against the Company if the judge allowed the case to go to them.

It has been suggested that the case against the Canal Company might be put even higher than we have put it. A case came, a few years ago, before the House of Lords in which the plaintiff was the occupier of a mine under a close of land, and the defendants were the owners of a mill in his neighbourhood. They proposed to make a reservoir for storing water for their mill upon another close of land adjoining to the close of the plaintiff. Underneath the defendants' close were certain old and disused mining passages and works. The reservoir was constructed. The defendants personally took no part in the works, but they employed an engineer who did not exercise that reasonable caution which might have been exercised, taking notice, as he did, of the disused passages and works. The reservoir was filled; the weight of the water forced it through these passages, and it passed into the workings under the plaintiff's close and flooded his mine. The House of Lords, in deciding this case, put aside the question of negligence, and held that if the defendants in the course of a "non-natural use of their close" injured the plaintiff they would be liable to him in damages. Bringing water into an artificially formed reservoir is here called a "non-natural use" of the close, and it is said that the defendants would make such use of it "at their own peril." There is, however, a manifest distinction between this case and that of a Canal Company carrying gunpowder as well as other goods along its canal, because that is the very thing which the Company was created and authorized to do. This distinction clearly appears from a passage in the judgment given in this case in the Exchequer Chamber, from which Court an appeal went to the House of Lords:—"There are many cases in which proof of negligence is essential, as, for instance, where an unruly horse gets on the footpath of a public street and kills a passenger, or where a

person in a dock is struck by the falling of a bale of cotton which the defendant's servants are lowering. But we think these cases distinguishable from the present. Traffic on the highways, whether by land or sea, cannot be conducted without exposing those whose persons or property are near to it to some inevitable risk; and that being so, those who go on the highway, or have their property adjacent to it, may well be held to do so subject to their taking upon themselves the risk of injury from that inevitable danger, and persons who by the license of the owner pass near to warehouses where goods are being raised or lowered certainly do so subject to the inevitable risk of accident. In neither case, therefore, can they recover without proof of want of care or skill occasioning the accident." Among "those who have their property adjacent" to a highway may be reckoned the dwellers in the Regent's Park near this canal, and it would seem to follow that they could not recover damages from the Company "without proof of want of care or skill occasioning the accident."

It must be remembered, however, that both judges and jury may, if they please, take the view that *res ipsa loquitur*, or, in other words, that the occurrence of the accident is in itself sufficient proof of negligence. This was done not long ago in a case where a brick fell from a wall supporting an iron girder-bridge, and struck a man who was passing along the street beneath, and no explanation was given of the occurrence, nor was it easy to invent any. The Court of Queen's Bench decided by two judges against one that there was evidence for the jury, and the jury had of course found for the plaintiff. In some of the early cases against Railway Companies it was said that the fact of collision was in itself evidence of negligence, but that has been qualified in recent years. Referring again to the case of the water passing from the defendant's reservoir to the plaintiff's mine, we find it said in the Exchequer Chamber that "the true rule of law is, that the person who for his own purposes brings on his lands, and collects and keeps there anything likely to do mischief if it escapes, must keep it in at his peril, and if he does not do so is *prima facie* answerable for all the damage which is the natural consequence of its escape. . . . The person whose grass or corn is eaten down by the escaping cattle of his neighbour, or whose mine is flooded by the water from his neighbour's reservoir, or whose cellar is invaded by the filth of his neighbour's privy, or whose habitation is made unhealthy by the fumes and noisome vapours of his neighbour's alkali works, is damaged without any fault of his own; and it seems but reasonable and just that the neighbour, who has brought something on his own property which was not naturally there, harmless to others so long as it is confined to his own property, but which he knows to be mischievous if it gets on his neighbour's, should be obliged to make good the damage which ensues if he does not succeed in confining it to his own property." It has been suggested that this reasoning is applicable to the case of bringing upon land or water gunpowder which it is known will be mischievous to adjoining land if it explodes. But in all the instances given by the Court there is an absence of that statutory authority to do the thing complained of which occurs in the case under consideration. We think therefore that some evidence of negligence must be given beyond the mere fact of taking gunpowder on board in order to fix liability on the Company. "Those who carry on operations dangerous to the public are bound to use all reasonable precautions—all the precautions which ordinary reason and experience might suggest to prevent the danger. It is not enough that they do what is usual if the course ordinarily pursued is imprudent and careless; for no one can claim to be excused for want of care because others are as careless as himself. On the other hand, in considering what is reasonable, it is important to consider what is usually done by persons acting in a similar business." These words, which were addressed by Lord Chief Justice Cockburn to a jury, lay down an intelligible rule. A definition of negligence given by Mr. Baron Alderson is "the omitting to do something that a reasonable man would do, or the doing something which a reasonable man would not do." In one of the cases arising out of a fire caused by an engine's spark the decision was in favour of the defendants, but only on the ground that they had taken all the precautions which science and experience could suggest to prevent the escape of sparks. If it could be shown that defendants had not only not done this, but had neglected some precaution which an Act of Parliament prescribes, the decision might be different. The Gunpowder Act of 1860 provides that fires shall not be lighted on board a vessel carrying gunpowder while the hatches are open, and if a vessel has no deck, and therefore no hatches, the Act would seem to prohibit fires altogether. The Act also forbids smoking on board vessels carrying powder, but if the crew smoked in violation of an express prohibition by the Company, it might be questionable whether the Company could be responsible, even supposing it to be shown that smoking caused the explosion. The facts as to character and stowage of cargo may be very material on the question whether the conduct of the defendants was reasonable and prudent. But it would be premature to discuss the facts of the case at present.

DANCING LICENCES.

IT cannot be said that the Middlesex magistrates, when engaged in considering applications for music and dancing licences, present a particularly dignified or edifying spectacle. Indeed it is impossible to imagine anything more anomalous or absurd than the way

in which these things are at present managed. If the decisions of the magistrates on the various cases were left to be determined by the simple plan of heads and tails, much time would be saved, a number of worthy gentlemen would be relieved from a rather ridiculous position, and the result, as far as public interests are concerned, would be much the same as now. It is obviously very important that music-halls, dancing-saloons, and suchlike places should be placed under strict and uniform supervision; but it is evident that this is not secured under the present system. In the first place, the tribunal which has to decide these questions is not always the same, and has no fixed rules or principles of action. Sometimes there is a large muster of magistrates, and sometimes a small muster, and the majority varies from year to year in its view of the necessity of strict regulation for public amusements. One of the peculiarities of the British public is a tendency to alternate hot and cold fits of morality or prudery; and the magistrates are naturally under the influence of these changes of temperature. One year they are very severe, and sniff scandal in every kind of entertainment; but by the time that next October comes round they are in an indulgent mood and ready to license almost anything. In an ordinary way, local magistrates are no doubt capable enough of disposing of licensing applications, because they are usually well acquainted with the neighbourhood and know its wants and peculiarities. But here we have a large body of respectable middle-aged gentlemen called upon to adjudicate on the relative decency of Cremorne Gardens and the Argyll Rooms, about which, we are bound to assume, they personally know nothing whatever. This is a reflection which seems to have occurred to some of the magistrates themselves, for we find that two of them, Mr. Alderman Figgins and the Hon. O. Butler, felt it to be their duty to visit the Argyll Rooms, and appear to have been charmed by the reception they met with. The Alderman stated that "from the nature of the establishment, whatever imperfections it might have, it was impossible that it could be better conducted;" but it is possible that he may have studied the "imperfections" under favourable circumstances. The Hon. O. Butler took a higher view of this valuable institution, and hoped that the people might be weaned "from the brutality of man-kicking and woman-beating, and give way to the more generous strains of music and dancing." It is probable that this testimony may have influenced the Court in granting a licence, but it is dreadful to think of what might be the consequence if the magistrates of Middlesex generally were to deem it necessary to prosecute their researches in this earnest manner. As it is, they sit and hear evidence which, as a rule, is not of the slightest assistance to them. In the case of a tavern at Hornsey, the police stated that they had found "young couples of both sexes in the arbours in the garden, caressing each other." This was of course a clear enough case, and the licence was promptly refused. When, however, the question of Cremorne was raised, the magistrates were assured by one set of witnesses that the gardens were frequented by women of bad character, while another set of witnesses swore that they saw no improper persons at all. It is clear that, in order to test this evidence, it would have been necessary to inquire how the character of the persons in question had been ascertained. The proprietor of the Argyll Rooms declared that "all women of questionable character" were excluded; and the current reputation of the establishment would certainly lead one to suppose that the company was of a very unquestionable character indeed.

The whole subject of the regulation of places of amusement of this class is a very difficult one, but it is idle to begin by affecting any ignorance of their real character. There can be no sort of doubt that a large part of the company at all these places is very bad indeed; but it may be reasonably asked whether it is possible that this vicious element can be excluded. If it cannot be excluded it must be tolerated; but public decency must be rigorously insisted on. It may be impracticable to discover the precise shade of character of every woman who goes to a music-hall or dancing-saloon, but it is quite possible to compel the company at large, no matter how composed, to behave itself in a quiet and decorous manner, under fear of the police. If there is nothing in the entertainments and nothing in the conduct of the audience which is contrary to good order and decency, it is difficult to see what more can be asked for, or at least obtained. With regard to the character of these entertainments, the question is a comparatively simple one. A good deal of time appears to have been spent by the magistrates in inquiring into the decency of four women at the Oxford Music Hall, who appeared under the name of the "Oxford Four," and were accused by the police of being indecent in their attitudes, gestures, and dresses. It was alleged in defence that there was nothing unusual in the dances of these performers or "in their manner of retiring down the stage"; that one of them wore a dress copied exactly from a real forestier's costume, "all except the boots"; and that another, who represented Charity, wore a dress which came below her boots. It was also stated that the "Oxford Four" had had their fling at the Marylebone Theatre on one occasion when the performances were under the patronage of Mr. Forsyth, M.P., and that no complaint was made by that most respectable gentleman. All this kind of evidence goes for very little, for the simple reason that it is scarcely possible to test its value. There can be no difficulty whatever in ascertaining whether there is frequent or habitual indecency in the entertainments at any place of amusement if a competent person is appointed to keep his eye on them and report any irregularities; but

loose evidence such as was brought forward in this instance settles nothing. As the magistrates granted a licence to the Oxford, with a caution to the manager to be careful in future, it must be supposed that they came to the conclusion either that there had been no serious indecorum, or that it was only a casual offence.

The case of Cremorne is a striking example of the changeable moods of the magistrates on questions of this kind. These Gardens, the character of which is well known, had been open for more than twenty years. In 1871 the magistrates suddenly discovered that the Gardens were visited by improper persons and were a public nuisance, and refused the music and dancing licences. Next year the licences were still withheld; but last year the magistrates partially relented and granted a music licence, and now they have altogether given way, and allowed both licences. All the while the proprietor has had a theatrical licence from the Chamberlain, and also one from the Excise, so that he could keep open a theatre, and sell any quantity of liquor. No objection is taken to the performances at the theatre, and it may be assumed that it is frequented by much the same sort of people as the Gardens formerly were, and again will be. If it was right that there should be no music or dancing at Cremorne for two years, no reason can be suggested why either should now be permitted. It is unnecessary to accept the glowing pictures of the attractions of this Arcadia, with its "pure fresh air," its "healthy and rational amusements," and the pleasing groups of Foresters and Druids dancing with their families and friends, which was drawn by the counsel for the proprietor. It seems that the Druids have deserted their accustomed groves, and will not go where they cannot dance; but they will now have an opportunity of returning. If public dancing is to be allowed anywhere, it would seem that it might as well be practised at Cremorne as anywhere else; and the same remark applies to the fireworks and the balloon ascents, which might just as reasonably be prohibited at the Crystal Palace as at Cremorne. It can readily be understood that the existence of such a place as this is scarcely calculated to attract quiet and respectable householders to the neighbourhood; but, on the other hand, it should be observed that the houses have come since the Gardens were opened, and almost every neighbourhood has its own peculiar nuisance in one shape or another.

In almost all the cases in which people make complaints about places of amusement of this class we are disposed to believe that the complaints are well founded. There is no room for any kind of doubt as to the sort of company which resorts to such places, or as to the purposes for which they exist, and it is unnecessary to countenance any of the pretences and affectations of the proprietors. They are bad places frequented by disreputable people, and they do a great deal of harm; on the other hand, it is impossible to suppress them without at the same time interfering vexatiously with various forms of amusement which are perfectly innocent. They must be tolerated, therefore, but under stringent regulations as to order and decorum; and it would certainly be well if the supervision which is necessary were entrusted to some more competent tribunal than the local magistrates. We may admit that they acted not unreasonably under the circumstances in reversing the decisions as to Cremorne which had been in force for a couple of years; but it is not desirable that Mr. Baum's counsel should be provided with an opportunity of advertising his client's establishment as a place of "healthy and rational amusement." It may be unavoidable that such places should be allowed to remain open, but there is no reason why their real character should not be recognized.

THE GROWTH OF INCOMES IN PRUSSIA.

A WRITER in the Berlin *Deutsches Handelsblatt* has in a recent article attempted to estimate the increase that has taken place in the incomes of the several classes of the Prussian population between the years 1852 and 1873; and although he does not put forward his calculations as anything more than roughly approximative, it may be of interest to reproduce the results at which he has arrived. The period which he has chosen for his inquiry is one that has been marked by a vast increase of activity in trade throughout the entire commercial world, and consequently by a great accumulation of wealth in the principal countries of Europe and America. At its commencement the fierce revolutionary outburst of 1848 had already spent its force, order had everywhere been restored within Germany and beyond her borders, and the working classes, disabused of their delusions, had returned to plodding productive industry. In France the Second Empire was just being set up, and the people were beginning to throw themselves with energy into the development of their material resources, with the success which has since so much astonished the world. Among ourselves, the policy of free trade had for some years been definitively adopted, the effects of the railway mania of 1846 and the Irish famine had worn themselves out, and commerce and manufactures were starting forward on that career of prosperity which forms the theme of so many patriotic effusions. As regards America, the great emigration from Ireland and Germany had already attained enormous proportions, and in consequence States and cities were springing up like the castles of the Genii in the *Arabian Nights*. And at the same time the gold discoveries in California and Australia were supplying the means of

exchange which allowed of the productive employment of this vast daily accession to the working power of the Union. Further, in our own North American, Australasian, and South African colonies somewhat similar phenomena were displayed; while in India the final conquest of the Punjab had brought the entire peninsula from the Himalayas to Cape Comorin and from the Suleiman range to the Gulf of Martaban under the undisputed sway of England, and had thus permitted the Government to turn its attention to the construction of railways, roads, telegraphs, and other works of peace, and had fostered a large trade between the dependency and the home country. Lastly, the isolation of China had been broken down, and that enormous Empire was already doing a large business with the Treaty Powers in tea, silk, opium, and other articles; while a few years later Japan also was brought within the domain of commerce. Thus, as we have said, the period has been characterized by an energy and an expansion of trade unparalleled since the extraordinary outburst of enterprise which led to and followed the discovery of America. It cannot be without interest to inquire what part has been taken in this movement by Prussia. At the beginning of the period she occupied a very secondary position. Even then, it is true, she was reckoned one of the Five Great Powers, but to the ordinary observer she seemed to owe her rank to the favour of Russia and England rather than to her own inherent strength. At the end of the period she is unquestionably the foremost of European nations. Has the material improvement of her people kept pace with her wonderful political advancement?

The writer in the *Handelsblatt* to whose article we are indebted for the Prussian statistics which we proceed to quote bases his calculations on the returns of the Income-tax and the so-called class-tax (*Klassensteuer*). As we know from the experience of our own country, Income-tax returns are not always trustworthy statements of income. Still it is probable that errors from this source are reproduced year after year, and that consequently they do not seriously obscure the annual increment of income, which is all we are concerned with. The *Klassensteuer* returns give a less accurate view. This tax is only a modification of the Income-tax, being levied upon persons whose incomes are under 1,000 thalers, or 150*l.* sterling. But these persons are ranged in thirteen classes, and the tax is assessed at a uniform rate for all the members of each class. For example, all persons with incomes between 900 and 1,000 thalers pay alike 24 thalers. It will be seen that from the yield of the tax it is impossible to calculate anything more than the average income of each class. For the purpose we have in view, however, that is a sufficiently close approximation. But now we come to what is a real defect. There are certain cities, notably Berlin, where neither Income-tax nor class-tax is levied, the places of these imposts being taken by the grist and the slaughterers' taxes (*Mahl- und Schlachtsteuer*). For these cities there exist no returns, and consequently the writer in the *Handelsblatt* has had to supply their place by conjectural estimates, of the soundness of which we have no means of judging. Lastly, in the annexed provinces, Hanover, Schleswig-Holstein, Hesse, and Nassau, Income-tax was not imposed before 1866. Accordingly for these also, so far as regards the beginning of the period, conjecture has to take the place of official returns. The estimate then is at the best no more than a very rough approximation, but even as such it will be found, we think, both interesting and instructive.

We should have liked to compare our own statistics with those here supplied, but from what we have said this, it will be seen, is only partially possible. The Prussian *Klassensteuer*, for instance, is assessed on incomes as low as sixty thalers, or nine pounds sterling. The returns apply therefore to the very lowest rank of the working classes, to every person in fact who is self-supporting, from whatever source his livelihood is derived. We need not say that there is no similar tax in this country. It may, however, be noted that the entire amount assessed to property and Income-tax in England and Wales alone amounted in 1852 to 231,799,429*l.*; while, according to the estimate before us, the taxable incomes of Prussia (including the annexed provinces) amounted in the same year to no more than 180,630,000*l.* The amount actually assessed in Prussia has been increased sixty per cent. in this estimate to arrive at the real incomes, yet the taxable value of the incomes of the classes above the wage-earning in England and Wales exceeded the real value of the incomes of all classes in Prussia by more than 50,000,000*l.*, or over one-fourth. To complete the comparison it may be well perhaps to add that the population of England and Wales in 1852 was only 17,907,609, while that of Prussia was 21,120,000, or 3,212,391 greater than the English. Further, we find that the aggregate incomes of Prussia had increased in 1873 to 290,447,700*l.*, in this case 50 per cent. being added to find the real incomes, while the assessed value in England and Wales had grown in 1872 to 613,233,690*l.* In twenty years the assessed value in England and Wales had been multiplied over 2.6 times; in twenty-one years the real incomes of Prussia had increased somewhat more than 60 per cent. In other words, the increase in England had been between three and four times as rapid as in Prussia. Further, the population of Prussia in December 1871 was 24,693,487; in April of the same year that of England and Wales was 22,711,266. The rate of increase in England was, therefore, 27 per cent.; in Prussia, 17 per cent. Whether we regard population or wealth, then, it will be seen that England is growing much more rapidly than Prussia. Again, incomes in Prussia had increased 60 per cent. against an increase of only 17 per cent. in population; in England, the annual value of the in-

comes of the propertied, trading, and professional classes increased over 160 per cent. against an increase of 27 per cent. in population. Thus it will be seen that the growth of incomes in Prussia was at a rate relatively about three and a-half times more rapid than that of population. In England the growth of property liable to Income-tax was just six times more rapid than population. Lastly, it will be seen that, whereas Income-tax paying property in England and Wales exceeded the sum of all the real incomes of Prussia in 1852 by considerably less than one-third, it is at present considerably more than twice the sum of all such incomes. In one of his election speeches last February Mr. Disraeli pointed to the multiplying productiveness of the Income-tax as one of the great sources of the prestige of this country. In the figures we have just been citing we have proof that he was not speaking without book. At the time of the *Coup d'état*, as we have just seen, the fund upon which England had to draw within her own borders exceeded the fund on which Prussia had to draw but little over one-fourth; it exceeds it now twice over, and this though Prussia goes down to the very lowest of her population, while England stops short almost altogether of her working classes.

Confining our attention now to Prussia, we find that 7,963,535 persons—about one-third of the whole population—were assessed to these taxes in 1873. The fact affords proof both of the wide distribution of property among the masses, and of the almost universality with which those able to work are productively employed. Another fact, which shows equally clearly the very moderate means of the people generally, is that 7,840,251 persons were assessed to the *Klassensteuer*—that is to say, were in receipt of incomes assessed under 150*l.* sterling, while no more than 123,284 persons were assessed at higher incomes. For one assessed at 150*l.* a year and upwards, that is, there were last year close upon 64 assessed at less; and, further, there were over 5,000,000 whose incomes were assessed at 9*l.*; or, adding 50 per cent. to find the real income, considerably more than five-eighths of the income-receiving population were in receipt of 13*l.* 10*s.* per annum, or less. On the other hand, 58 were assessed at incomes exceeding 15,000*l.* a year; and as many as 22 were assessed at 36,000*l.* a year, and over. This latter is the highest limit. Again, if the whole of the incomes had been thrown into hotchpotch, and equally divided, each income owner would have received 13*l.* 14*s.* in 1852; in 1873, 18*l.* 16*s.*, which gives an increase of 37 per cent. We have seen above that, comparing the sum of all the incomes in 1852 and 1873, the increase is about 60 per cent., but from what we have just been saying it will be seen that the increase in the very small incomes is considerably less. Indeed, for the first seven classes assessed to the *Klassensteuer*, that is, for about seven-eighths of all the income-owners of the kingdom, the increase is only 44 per cent., and as we go down to the bottom of the scale the increase becomes smaller still. On the other hand, the increase in the great incomes was over 500 per cent., and the increase in the number of persons with large incomes is equally remarkable. For example, in 1852 there were but six persons assessed at incomes between 15,000*l.* and 36,000*l.*, and but one over the latter amount. In 1866 the numbers respectively were still only eleven and three. But in 1873 thirty-four were assessed between 15,000*l.* and 36,000*l.*, and eighteen over the latter amount. In seven years, therefore, the numbers had been multiplied three times and six times respectively. The explanation suggested is that the rapid growth of these large incomes is the consequence of the enormous loans recently raised by so many Governments, not the fruit of legitimate trade. As for the great mass of the people, the reader will by this time be prepared for the conclusion arrived at by the writer from whom we have been quoting—namely, that the improvement in their condition is more nominal than real. Bearing in mind the extraordinary rise of prices, due in the first place to the gold discoveries, and in the second to the local influence of the enormous influx of money caused by the payment of the French indemnity, he is of opinion that the increase of income which has taken place does little more than prevent deterioration.

THE CESAREWITCH AND MIDDLE PARK PLATE.

THE small number of acceptances for the Cesarewitch was probably due more to the general unpopularity of long races, and to the severity of animals with any pretensions to compass a two-mile-and-a-quarter course, than to any feeling of dissatisfaction with the handicapper's workmanship. The old horses had plenty of chances given to them. Shannon, 6 yrs., 8 st., and Louise Victoria, 5 yrs., 7 st. 7 lbs., had certainly no reason to complain of their weights; and even so distinguished a mare as Marie Stuart was not burdened with more than 8 st. 12 lbs., which, though a heavy, cannot be considered a crushing, impost for a first-class four-year-old. If there was any error in the handicapping, it was an error of leniency, not of severity. When it was seen that Mornington, a six-year-old, was let in with no more than 7 st. 3 lbs., it was obvious to the most inexperienced that, if he were the Mornington who carried off the City and Suburban and Great Metropolitan, the Cesarewitch was a gift to him. On the other hand, it was asserted that the handicapper would never have turned him loose into the race had he not felt assured that he was not sound enough to stand another preparation. But if weights are to be apportioned, not according to the form shown in recent public performances, but according to rumours or private information about the strength or weakness of

a horse's legs, evidently their apportionment becomes a mere matter of haphazard. If the handicapper made sure that Mornington would break down, he might as well have given him the lowest weight, 5 st. 7 lbs., as 7 st. 3 lbs., for he would have broken down equally in either case. As it turned out, Mornington did actually break down, and so must have lost the race whatever had been his weight; but he did not break down till the very last moment. He stood his preparation, he did his work in a manner that entirely satisfied his friends, he arrived at Newmarket fit and well, and he started first favourite. The ground being in the most perfect condition for racing, neither too hard nor too holding, the odds were that, having stood on his legs through an unusually dry season, he would be able to stand up for five minutes more. But, those last five minutes proved fatal to Mornington. He broke down in the middle of the race when he was going, to use a common expression, like great guns, and his racing career has ended. The proverbial good luck of the handicapper has again attended him, and saved him from the annoyance of seeing his workmanship spoiled by the runaway victory of a turned loose six-year-old; but, nevertheless, we must repeat that the principle on which Mornington's impost was apportioned seems to us altogether erroneous. That a six-year-old like Shannon should be admitted into the race at the comparatively lenient weight of 8 st. was quite intelligible, for the daughter of Lambton and The Mersey has given public proofs of a gradual deterioration in form since her memorable victory in the Goodwood Cup. But there was no public proof that Mornington had lost his form.

The twenty-five runners that came to the post on Tuesday last were not, on the whole, of superior quality. The leading favourite at the close was a four-year-old gelding by Wamba, out of Truth, who had only 5 st. 12 lbs. to carry. Hesselnden, another prominent favourite, had likewise no public performances to recommend him, yet the race was considered by the highest authorities a certainty for one of these two, in the event of Mornington not standing up to the end. Louise Victoria had won the Ebor Handicap last year, but nothing was known of her form this year, and it was noticed at Doncaster—where she did not run—that she was suffering from stringhalt. Shannon, as we have said, was known to have deteriorated. The Pique ran very badly at the First October Meeting, and the few good sound horses among the twenty-five, such as Scamp, Eole II., and Royal George, were not particularly favoured in the weights. Royal George, for instance, had to give the Truth gelding 27 lbs., and Scamp gave him 26 lbs. and a year. The twenty-five were weighed out and despatched to the post with the punctuality that always prevails at Newmarket, but we cannot help remarking on the inconvenience of fixing a great race on an October afternoon at so late an hour as four o'clock, or a few minutes before. Last Tuesday was a most brilliant autumn day, but even on the finest day at this season of the year the light grows dim before four in the afternoon, and it becomes difficult to distinguish colours at a distance. Darkness came on even earlier than usual last Tuesday afternoon, and by a spectator stationed in the neighbourhood of the winning-post nothing whatever could be made out of the position of the horses until they had got to the Bushes, or within a quarter of a mile of the finish. At that point the red and yellow of Mornington were looked for in vain; Hesselnden was seen to be hopelessly beaten, and to be rolling about from side to side; the scarlet of Louise Victoria was discernible in the extreme rear; and Eole II., after a gallant attempt to maintain the forward position he was then occupying, was compelled to succumb. Royal George was going well at that time, as was also the German horse Gamecock; but a horse ridden by a jockey in white jacket and red cap, whom it was difficult to identify at the moment, came out of the dip with a clear lead, closely followed by Royal George's stable companion Aventurière. Thenceforward the race was a match between this pair; and the finish up the hill was finely contested between them. The unknown horse turned out to be the Truth gelding, who was ridden in wrong colours, and as he went up the hill Aventurière gained on him inch by inch, and running with the greatest gameness she just got her head in front in the last stride, and won literally on the post. The defeat of the Truth gelding was a heavy blow to his backers, especially as he was carrying 3 lbs. overweight; and according to all the rules of racing, if those 3 lbs. had been taken off, the head would have been the other way. The victory of Aventurière was a surprise, though it must be admitted that Lord Ailesbury's mare has recently exhibited a great improvement on her Spring form. It is believed that when she and Royal George were tried together the horse won, but by so little that they were fully expected to finish close together in the Cesarewitch. The mare, however, beat her stable companion very decisively in the race; but it strikes us that, had Royal George been ridden out for a place, he might possibly have obtained one. Aventurière owes her victory to the unflinching gameness with which she wore down her lightly-weighted opponent, the Truth gelding, and to the able riding of Glover, who has had the most extraordinary good fortune in winning the big handicap races of this season. He had already won the Great Metropolitan, the Chester Cup, the Goodwood and Brighton Stakes, the Lowes Handicap, and the October Handicap, and now the Cesarewitch is added to the list of his victories. We need only add that the German horse Gamecock figured very creditably in the race, and finished third, *Peut-Etre* being returned as fourth, Tichborne fifth, and Royal George sixth. The unfortunate Mornington walked in with the crowd.

On Wednesday a large and brilliant field of twenty-four met to

contest the greatest two-year-old prize of the racing season. The public performers included Galopin, the winner of the Hyde Park Plate at Epsom, and the Fern Hill and New Stakes at Ascot, Holy Friar, who had won every race in which he had taken part, Telescope, winner of the Lavant Stakes at Goodwood, Balfie, winner of the Chesterfield and Hopeful Stakes, Dreadnought, Horse Chestnut and Chaplet. Among the dark horses were Plebeian, Per Se, a daughter of Hermit and Perseverance, Punch, the representative of the formidable French stable, and the Make-shift colt, the representative of Mr. Merry. The field also included Stray Shot, Woodlands, Maud Victoria, and The Fakenham Ghost. By many the race was looked upon as another match between the North and South of England, with Holy Friar and Galopin to fight the battle. Their public credentials were certainly undeniable, and Holy Friar, in particular, had beaten Camballo—a really good horse—so easily at Doncaster that his claims to support seemed the superior, especially as he was receiving 4 lbs. from Galopin. Of the dark horses Per Se was most talked about, and it was reported that she had won an extraordinary trial; while at the very last moment Woodlands, who won two small races at Goodwood and Brighton, was elevated to the rank of second favourite. Most of the leading competitors, with the exception of Galopin and Telescope, were saddled in the birdcage, where they attracted the usual attention. The three most liked were Holy Friar, Per Se, and Plebeian, the latter of whom quite belies his name and his unfashionable breeding; and the one least liked was Punch, who is a great leggy horse. The race had been prudently fixed for three o'clock, an hour earlier than the Cesarewitch, for, with so large a field of young horses, considerable delay at the post might have been expected. On the whole, however, they were very well behaved, and after two or three breaks away the starter was enabled to catch them in time and to drop his flag. The light also being favourable, it was possible to see the progress of the race almost from its commencement. A distinguishing feature of the contest was that there was hardly any tailing off, and even at that critical point, the Abingdon bottom, there were seven or eight horses all going well. Holy Friar, on the judge's side of the course, held perhaps a slight lead as they began the ascent, while Galopin, just under the rails on the opposite side, seemed his most formidable opponent. The latter was then joined by Plebeian and Per Se, and these three ran locked together on one side, while Holy Friar, separated from them by almost the width of the course, pursued his journey. So easily did he appear to be winning, that his jockey never really called upon him till in the last few strides, when he seemed suddenly aware of the dangerous opposition on the other side of the course. Still Holy Friar had so much in hand that both his jockey and the majority of the spectators felt assured of his success, and great was the consternation of his supporters when, on the numbers going up, it was seen that he was not in the first three. The judge's verdict was that Plebeian had won by a head; that a head separated the winner from Per Se, who was placed second; that there was another head between Per Se and Galopin, who was placed third; and yet another head between Galopin and Holy Friar, to whom was awarded the fourth place. As we have often had occasion to remark, Newmarket courses are most puzzling, not only to spectators, but to jockeys also; and it frequently happens that the public think one horse has won, the jockey is convinced of the success of a second, and the judge differs from both. At Newmarket we are satisfied that no one can really judge except the judge himself; and therefore we are always quite satisfied with the correctness of the judge's award. At the same time we feel convinced that the defeat of Holy Friar was purely accidental, and that he might have won easily had not his rider, than whom there is not a more upright or more skilful jockey in England, thought victory so certain that he was unwilling to call upon his horse for any extra exertions. We may add, in connexion with the Middle Park Plate, that the four leaders were well clear of the remainder of the field, at the head of which came Punch and Horse Chestnut, the latter of whom ran well in front for a considerable portion of the distance, but could not stay. Galopin, who was conceding the winner 7 lbs., proved himself a great horse, and as he was slightly disappointed at the finish, we may make bold to believe that Holy Friar and he, if all had gone well, would have occupied the first and second places at the finish. We have no wish, however, to detract from the merits of Plebeian, the uncommonly good-looking brother to Chawaboon, or of Per Se, who all but revived the glories of the once famous Danebury stable.

REVIEWS.

LIFE OF LORD PALMERSTON.*

THE long and accurate title-page of the second volume of the Life of Lord Palmerston indicates the process by which a fragmentary compilation has been prepared for publication. Lord Dalling had apparently exhausted his scanty materials in papers which remained at his death in a confused and unfinished state.

* *The Life of Henry John Temple, Viscount Palmerston; with Selections from his Correspondence.* By the late Right Honourable Sir Henry Lytton Bulwer (Lord Dalling). Edited by the Honourable Evelyn Ashley, M.P. Vol. II. London: Bentley & Son.

Mr. Ashley has arranged the documents in proper order, and he has added a few of Lord Palmerston's letters with the smallest possible thread of connecting statement. The biography, as it is called, ends with the year 1847, some time before Lord Palmerston's domestic career as a statesman had even begun. Mr. Ashley would have added to the obligation which he has conferred on Lord Dalling's readers if he had found time to supply the broken narrative with an index, a table of contents, or even a notice inserted from time to time of the points at which Lord Dalling's composition begins or ends. Mr. Ashley may probably possess ability as an original writer, but, if he disdains the modest function of an editor, he would have done better to entrust the task to less ambitious and more careful hands. Although the book is not a biography of Lord Palmerston, it possesses considerable value. The detailed part of the story relating entirely to Spanish politics is related by a confidential and zealous agent, who at the same time admires his principal and severely criticizes his instructions. Lord Dalling, more or less unconsciously, wrote a fragment of autobiography in the form of a *Life of Lord Palmerston*. He seems to have known but little of any of Lord Palmerston's transactions with which he was not personally connected; but the details of a single diplomatic correspondence probably illustrate the character of a statesman as fully as the most comprehensive summary of his general policy. The letters to Sir W. Temple which are published by Mr. Ashley are highly interesting. The popular estimate of Lord Palmerston's frank, cheerful, and manly character is fully confirmed by the specimens which are published of his private correspondence.

The unsavoury history of the Spanish marriages has lately been revived on the occasion of M. Guizot's death. The sanctimonious designer and instrument of the crime had long before published all the French details of the successful intrigue which has covered him with indelible disgrace. The diplomatic proceedings of Lord Palmerston and of Mr. Bulwer, then English Minister at Madrid, are now for the first time fully known. Even if King Louis Philippe and M. Guizot had enjoyed no other advantage in the contest, their chance of winning the game was greatly increased by the unity of purpose which regulated French trickery at Paris and at Madrid. The Minister, though he had little love for his Sovereign, was deeply interested in the accomplishment of a family plot which seemed also to involve a national triumph. Both were served at Madrid by an unscrupulous agent in the person of Count Bresson, who, in the opinion both of Lord Palmerston and Mr. Bulwer, was deficient in the qualities of a gentleman. On the other hand, Mr. Bulwer's exertions were from first to last disapproved and thwarted by Lord Palmerston, who, if his representative and friendly biographer is in the right, perpetrated from the moment when he undertook the conduct of the negotiation an uninterrupted series of blunders. It is remarkable that M. Guizot never even understood the wishes of Lord Palmerston, although he well knew that the English Government was irreconcilably opposed to the scandalous choice of Don Francisco as the husband of the Queen. While Mr. Bulwer was eager to accept the overtures of Queen Christina for a marriage with Prince Leopold of Saxe-Coburg, Lord Palmerston preferred the younger brother of Francisco, Prince Henry, who was two or three years ago killed by the Duke of Montpensier in a duel. It is possible that Lord Palmerston may have been justified in his suspicion that the language used by the Queen Regent and her Moderado Ministers in their communications with Mr. Bulwer was intended as a trap, for the purpose of providing the King of the French with an excuse for forcing on the marriage with Don Francisco, by which it was hoped that the ultimate succession would be secured to the descendants of the Duke of Montpensier. On the other hand, it was necessary to incur some risk, and, although it would have been absurd to trust a Spanish Court or its agents, there was some reason to believe that Queen Christina might desire to save her daughter from the misery and ruin which were prepared for her by her great-uncle and by the pious Guizot. That the Regent would prefer her own interests to the welfare of Queen Isabella was certain even before it was proved by the result; but she would have been supported by the unanimous feeling of the Spanish nation if she had defeated the French plot by concluding the marriage with Saxe-Coburg. Prince Henry was politically allied with the Progressist Opposition, and he was the personal enemy of Christina. With Saxe-Coburg she had formed a friendly connexion; Don Francisco was a nullity in politics; but the accession of Don Henry to the rank of titular king would have probably caused her exile. Mr. Bulwer always retained his belief that the Queen had been sincere in her offers; and he justly censures Lord Palmerston's determination to ally himself with the Opposition rather than with the Ministers who had the power of deciding the fate of the struggle. Lord Palmerston was perhaps influenced by the advice of Lord Clarendon, who during his long residence in Spain had been himself the virtual head of the Progressist party. As Lord Palmerston was at all times averse to the modern doctrine of non-intervention, the system of identifying English policy with the supremacy of one party in Spain would in ordinary cases have been intelligible, if not judicious; but in a contest which was to be decided in a few weeks or days it was a mistake to play a waiting game. Although M. Guizot misunderstood his opponent's immediate object, his belief that Lord Palmerston was busily engaged in counteracting the efforts of France was perfectly well founded. Queen Christina was urged to agree to the marriage with Francisco on the assumption that England was pressing the claims of Saxe-Coburg, and the Queen ultimately gave way because Lord Palmerston threatened her

with the selection of her enemy Prince Henry. M. Guizot was lucky in the change of Ministry in England during the summer of 1846. He would probably in any case have hunted down the poor girl who was his destined victim; but an avowed breach of faith to a confiding and generous friend would have been more embarrassing than a deception practised on an adversary who never concealed his just appreciation of the austere French Minister's character. Upright, timid, and credulous, Lord Aberdeen, if he was not a vigorous diplomatist, was a perfect gentleman. Implicitly relying on M. Guizot's promises that he would act in concert with England, he erroneously thought himself bound to communicate to the French Government Queen Christina's overtures for a Saxe-Coburg marriage transmitted through Mr. Bulwer. It would have been difficult for the most virtuous of intriguers to find in Lord Aberdeen's unbounded confidence a pretext for deceit. Lord Aberdeen had made more than one weak and injudicious concession, but he trusted in the explicit promise of the French King and his Minister that the Montpensier marriage with Donna Carlotta, if it were not abandoned, should be postponed until the Queen had children. When M. Guizot insolently insisted on the condition that the Queen of Spain should marry a prince of the House of Bourbon, Lord Aberdeen abstained from protesting against the French pretension, although he never explicitly admitted it. His silence and the pretended support of Saxe-Coburg by his successor were afterwards made the excuse for the perfidious policy of which M. Guizot was proud. If Lord Aberdeen had remained in office, it would have become necessary to commit an open and unqualified act of bad faith. When Mr. Bulwer was shortly afterwards sent out of Spain by General Narvaez, he, according to his own statement, explained his conduct to the full satisfaction of Lord Aberdeen and Sir Robert Peel; and it is certain that Sir Robert Peel discountenanced and prevented any disapproval which might have been expressed in the House of Commons. Lord Palmerston proposed to answer the affront by the despatch of an English fleet to Cadiz, but he was overruled by colleagues who at all times feared and distrusted his vigorous policy.

The Spanish disputes which filled a great part in the diplomatic career of Lord Dalling were only an episode in the life of Lord Palmerston. It is to be hoped that at some future time a competent biographer will fill up the blanks which at present occupy the greater part of the space allotted to his life. During his long administration of the Foreign Office he steadily adhered to the principle of insisting against all Powers, great or small, on the rights of England. He disapproved of the large concessions made by Lord Aberdeen through Lord Ashburton to the United States, not so much for the sake of the territory actually surrendered as on the ground that concessions made to an overbearing adversary inevitably invite further aggression. The opposite policy of Mr. Gladstone and his colleagues immediately produced the Indirect Claims, and resulted in the iniquitous Geneva Award; and as a further consequence every European Power is now convinced that no encroachment will provoke resistance on the part of England. No European war occurred in Lord Palmerston's time, unless the petty Syrian campaign of 1840 deserves the name, as having arisen from a conflict of English and French policy. Lord Dalling attributes the Crimean War to the impression produced on the mind of the Emperor Nicholas by the acquiescence of the English Government in the insult offered to it by Narvaez. It is more certain that the submissive attitude of Lord Aberdeen and an erroneous belief in Mr. Cobden's influence were the determining causes of the policy of Russia. When Mr. Gladstone moved for a grant of money to take the Guards to Malta and back again, the confidence of Russia in the patience or cowardice of England was irretrievably confirmed. At a much earlier period, during the short Conservative Ministry of 1834 and 1835, Lord Palmerston bore witness to the more resolute policy of a political adversary, extremely unlike Lord Aberdeen:—

I suspect [he told his brother] that the Duke is, if possible, more hostile to Russia than I was, fully as much impressed with the necessity of checking her insatiable ambition, and quite as determined to employ the means which England possesses to do so. The fact is that Russia is a great humbug, and that if England were fairly to go to work with her we should throw her back half a century in one campaign. But Nicholas, the proud and insolent, knows this, and will always check his pride and moderate his insolence when he finds that England is firmly determined and fully prepared to resist him.

There are probably still a few survivors of a crazy little sect which thirty years ago taught as its central doctrine that Lord Palmerston was the docile tool and hired agent of Russia. It seems that even in his secret confidential letters he prudently retained the mask of patriotism. It is a pleasant change from diplomacy to hear in his letters to Sir W. Temple of his modest winnings on the turf, of his hunting and shooting, of his plantations at Broadlands, and of the Methodist gardener whose preaching he intends, if possible, to stop. He enjoyed the official holiday which resulted from the accession of the Conservative Ministry in 1841, especially because he entertained no doubt that he should return to power after a longer or shorter interval. Yet at that time, and for several years afterwards, he stood apart from the Whigs, with whom he was neither connected by family nor united by early political associations. The distrust of the party was indicated by Lord Grey's refusal to join the proposed Ministry of Lord John Russell in 1845; and although Lord Palmerston's ability and reputation made him indispensable to the Government which was formed in the following summer, the latent dislike found unexpected expression in his peremptory dismissal by Lord John

Russell in 1851. By that time Lord Palmerston had, to the unbounded surprise of the veteran Whig leader, become the favourite of the party. Within two months from his own fall he overthrew the Government, and after a short interval he established himself for life as the chief of the Liberals. It is said that he accurately foretold the fall of the uncongenial colleague who was during his term of office evidently destined to be his successor.

One of the most interesting letters published by Mr. Ashley, and addressed in 1842 to Lord John Russell, contains a bitter attack on one of the chief representatives of that section of the Whig party which systematically opposed Lord Palmerston's policy. Mr. Ellice had been an active and even restless member of the party when Lord Palmerston held office in a Tory Government, and when the Whigs, under the guidance of his brother-in-law, Lord Grey, opposed the war which was conducted by the successors of Pitt. When Lord Grey became Minister, Mr. Ellice, as Political Secretary of the Treasury, was the principal manager of the personal arrangements and minor negotiations which facilitated the passage of the Reform Bill. In 1834 he retired finally from office, after sitting for a short time in Lord Melbourne's Cabinet, and, with a large acquaintance and an ample fortune, he amused his leisure with the exchange of oral and written correspondence with English and foreign politicians. In his old age his busy idleness mellowed into agreeable gossip, seasoned by anecdotes of his long political experience. While he still exercised influence in public affairs both as a sagacious member of the House of Commons and in general society, his opposition to any active statesman might reasonably cause irritation or fear according to the character of his adversary. He never trusted Lord Palmerston nor approved his policy, and his dislike was fully returned. His criticisms were the more obnoxious because he lived much at Paris and in the society of the French statesmen whose intrigues furnished Lord Palmerston with incessant occupation. The letter to Lord John Russell was perhaps intended to convey an answer and a warning to other members of the party as well as to Mr. Ellice. He says that

E—— set out in the days of Durham's ambition to endeavour to turn me out of the Foreign Office in order to get Durham in; and well punished he was for his treachery by the bitter disappointment which he felt at its failure. He was furious, and has never forgiven me, and, despite his wish to be cautious, he even now from time to time exhales his wrath by swearing on his honour that I shall never return to that office in the event of our party regaining power. I am not, however, much moved to anger by this hostility, because, thank Heaven, I know I am a stronger man than he is, and he knows that too, which does not make him love me the better.

It happens that Mr. Ellice often spoke of Lord Palmerston's strength as his distinguishing quality. There was no reason why a Whig politician who, like many others of the same party, failed to appreciate the soundness of Lord Palmerston's policy should not exert himself to prevent his return to office. Only three years after the date of the letter Lord Grey, a statesman incapable of intrigue, made the exclusion of Lord Palmerston from the Foreign Department the condition of his own acceptance of office. It seems that Lord John Russell had told Lord Palmerston that some of the Whigs and Radicals were disposed to take their views of foreign relations from Mr. Ellice. Lord Palmerston was right in his assertion of his own superiority of judgment, though not in his contemptuous tone. It is difficult to understand how Mr. Ellice's difference of opinion involved any moral delinquency. In another part of the same letter Lord Palmerston contrasts his own laborious attention to foreign affairs during ten years with Mr. Ellice's alleged employment of the same time "in gossiping and caballing in clubs and drawing rooms and country houses." He was fully justified in attributing to himself superior knowledge of his own proper business; but if a veteran Foreign Minister is never to be criticized except by those who are his equals in practical knowledge, he must be absolutely irresponsible. In the same spirit and with as little reason poets and painters complain of the independent judgment of critics; and cooks probably resent the complaints of employers who could themselves scarcely broil a mutton chop. It was not in Lord Palmerston's nature to be either intolerant or excessively sensitive; but he evidently took the opportunity of a special attack on a single opponent to defend himself against the censures in which Lord John Russell himself may sometimes have concurred. On the whole, the present fragment or sample of a biography tends to raise the character of Lord Palmerston.

THE CHURCH OF THE REVOLUTION.*

DR. STOUGHTON has followed up his volumes on *The Church of the Restoration* by his present work on the history of the English Church and of the Nonconformist bodies which then began to assume a separate organization of their own, from the expulsion of James II. to the death of William III. He is not without hope that he may one day be enabled to trace the consequences of the events he relates "through a careful study of the great religious movements of the eighteenth century" (p. 460). In regard to the instalment of his design which he now submits to the public, "I venture to add," he says, "that in this, as in my former volumes, I have endeavoured to maintain an honest impartiality in the estimate of characters and incidents, together with a firm attachment to my own religious and eccle-

siastical principles." We have no reason to complain of his having failed in either of these purposes, so far at least as they are capable of being reconciled. Dr. Stoughton's views on Church affairs are always those of a sturdy Dissenter of the Congregational denomination, but they are held and expressed in a spirit and language as different as can be imagined from that which passes current for truth and charity in the writings and speeches of the more prominent members of the so-called Liberation Society. Since he tells us that he has assigned a large space in this volume to the attempt at Comprehension in the year 1689, "as it is a subject of present interest, and because the proceedings connected with it have been but inadequately described," we are almost driven to the conclusion that he believes that a like plan of comprehension, whereby moderate Nonconformists may find themselves able to hold public communion with the English Church, is growing ripe for discussion, and may in some shape or other become one of the practical questions of the day. Sorry as we are to say so, we are fully convinced that the expectation (if, indeed, he cherishes it) is utterly chimerical, and, even though it could be realized in outward form, would disappoint the most sorely those who had been foremost in promoting it. But that temperate estimate of the actions and motives of persons with whom we have little in common, which renders Dr. Stoughton's pleasant, if rather superficial, narrative so profitable to read and digest, may be imitated by all of us to our very great profit. His wise reserve in passing judgment, his willingness to think the best even of Non-jurors and high prerogative men, his earnest desire to deal fairly with every subject that passes under his view, are qualities by no means so common as they ought to be; and since Dissenters are sure to study this part of our Church history, of which we have on the whole no great reason to be proud, we are quite content that they should do so under the guidance of one so intelligent, so calm, so unfeignedly truth-loving as our author.

The scheme of comprehension or reconciliation of Dissenters, which was formed immediately after the Revolution of 1688, proved something worse than a mere failure; it failed under circumstances which rendered all future attempts hopeless, if not impossible. We cannot assent to Dr. Stoughton's idea that this was one of the lost opportunities of history (p. 138); yet the prospect of success looked brighter then than it ever had done previously, or ever can again. There were no bitter rivalries, disappointed aspirations, keen recollections of wrongs given and received, such as had deprived the Conference at the Savoy of all good fruits. Churchman and Nonconformist had just emerged triumphantly from a struggle wherein they had shown a common front to a common foe. There were few vested interests or hard-won positions to be yielded up for the sake of peace as there would be now. The new King was more than favourable to the attempt. Himself a narrow Presbyterian, the terror of his wife's chaplains, Hooper and Covell, and even of Ken, at the Hague, he cared as much about securing for his co-religionists a share in the temporal goods of the Established Church as he cared for anything except a French war. Tillotson and Tenison, who took the lead in the enterprise (from which Burnet never figured much, though he did not refuse to help it on), were destined by the sovereign for the highest preferments he had to bestow. Yet the thirty Royal Commissioners to whom had been entrusted the preparation of the terms of comprehension for the sanction of Convocation (ten of them being Bishops, ten Deans or Archdeacons, ten from the flower of the London clergy), after holding eighteen sessions in the famous Jerusalem Chamber between October 3 and November 18, 1689, broke up without making a Report, or submitting any formal suggestion to any one. Six Commissioners never sat at all; four others had withdrawn early; on the last day it was difficult to form a quorum of nine. One cause for this *fiasco* was visible enough. Convocation had met twelve days before, and the Lower House had given full proof of its temper by electing Dr. Jane (one of the four deserters) for Prolocutor, by a majority of two to one over Tillotson. Proposals, therefore, were prudently withdrawn which were sure to have been contumeliously rejected; they were reserved for some better season, which never came.

But it is impossible to review the proceedings of the Royal Commissioners, or to study the brief abstract of their debates yet remaining to us, without perceiving that the chief obstacle to success was not opposition from without, which might perhaps be mitigated or overcome in more quiet times, but the very nature of the task which they had rashly taken in hand. It serves to show the little interest which the whole matter has excited, that the Prayer Book interleaved with their "alterations and improvements," deposited at their final meeting with Tenison, and by Bishop Gibson's directions afterwards sent to the Lambeth Library, remained almost forgotten till its contents were printed in 1854 by order of the House of Commons, although attention had been called to them in Birch's *Life of Tillotson* and other well-known works. The Blue-book of 1854 comprises also a diary of the proceedings of each session, kept by one of the Commissioners, Dr. John Williams, Rector of St. Mildred's, Poultry, afterwards Bishop of Chichester, from which we gather at least as much as from the annotated Prayer Book itself. From this most interesting document we learn that the point on which all these unhappy controversies with Dissenters hinge—the validity of ordination by others than by a bishop—never came under discussion before the eleventh session, and then elicited as many opinions as speakers. "The stopping of the present

* *Ecclesiastical History of England. The Church of the Revolution.* By John Stoughton, D.D. London: Hodder & Stoughton. 1874.

schism made it a necessity" to acknowledge them, as Burnet put the matter bluntly and truly. Unless Churchmen were prepared to give way here, the Commission was but labour lost; yet to concede so much as a general principle would be a surrender to the enemy of the very citadel and key of the position. So "it was agreed that it should be only for this turn, those that were in Orders, but not to proceed further"; a compromise which every one must have felt sure would be rejected without hesitation by those it was designed to satisfy.

Ignominious failure in regard to the chief subject at issue did not in the least deter the Commissioners from devising expedients as to lesser things which may almost be called puerile. The Holy Communion was still to be received kneeling, but those that "scrupled kneeling" might come to the minister some week-day before and tell him so, and might then receive "in some posture of reverence, in some convenient pew or place in the church." Ministers again who objected to the use of the surplice or the sign of the Cross in baptism might go to the bishop and tell him their mind, and the bishop, as he thought fit, might appoint one to officiate in the service in the objector's room. In regard to these matters well might Beveridge tell his brethren that "there was no end if we would take away all scruples." Of the Apocryphal lessons a clean sweep was made from the Prayer Book; the Athanasian Creed was dealt with in a way that might content the reformers of the Irish Church Synod; the black-letter Saints were removed from the Calendar, and the Commissioners even stooped to expunge the title of "Saint" before the names of the Apostles whose festivals were retained. Their corrections of the Prayer Book throughout every page present us with a curious, almost revolting, example of evil diligence. Well may Dr. Stoughton be "astounded at the extent of the proposed alterations" (p. 136), even though he may not agree with us in thinking that, by a curious infelicity, almost every one was made decidedly for the worse. There sat at that Board divines of the calibre of Stillingleet and Beveridge, real scholars like Lloyd and Patrick, but the only man who wrote tolerable English in the whole party was Sprat, Bishop of Rochester, who had retired after the second session. Hence the Collects, our glorious inheritance from the mediæval Church, were turned over to Patrick to revise, and to the slovenly gossip Burnet "to give fresh spirit to them," as is stated by Birch, whose own pen has been likened to a torpedo. That golden prayer, "O God, whose nature and property," &c., which in its English form all but rivels the condensed energy of the original in the sacramentary of Gregory the Great, was expelled partly "as strange and impertinent," partly "as it did not come in here by the authority of Convocation or Parliament"; it was simply misplaced in the book of 1686, used by the Commissioners, and in several editions of about the same date. One other out of their 598 heads of "improvements" will detain us but a moment. In the Burial Service, besides other pitiful variations, the unoffending epithet is got rid of in the clause "our dear brother here departed"; and this change, for which we can assign no reason save a very shocking one, must have commended itself to some people at the time, for we have known the same liberty taken, within the present generation, by at least one worthy clergyman of the Puritan school, now safely removed by death from all fear of penal laws. It was well that a volume which contains so much against which pure taste revolts should have lain buried till a period has arrived when we are more likely to be ashamed of its bad example than to copy it. One worthy speech of Stillingleet's deserves to be remembered amidst so much imbecility and lack of purpose on the part of his colleagues. When "it was sometimes queried, What good would this do as to the Dissenters?" he boldly made answer that "we sat there to make such alterations as were fit, and would be fit to make were there no Dissenters, and which would be for the improvement of the Service." *O si sic omnia.*

Dr. Stoughton has good reason for saying that he has tried to be impartial in estimating character. We observe but one instance of his failure in this particular, and that is when he alleges of John Moore, Bishop of Ely, that "his love of books weakened his regard for the rights of property" (p. 303). The charge of book-stealing was first made, we believe, by Tow, in Bridge's *History of Northamptonshire* (vol. ii. p. 45), and has been ascertained to rest on no good grounds. To Archbishop Tenison he seems over-indulgent, and speaks of his intellectual powers and "rock-like firmness" in a tone to which we have not been used. Swift, we suppose, must be regarded as a prejudiced witness when he asks "by what talents that great prelate ascended so high," especially as he long afterwards appended to Macky's description of his Grace as "a plain, good, heavy man," the indignant comment, "the most good-for-nothing primate I ever saw." Burnet's, too, is faint praise when, relating his translation from Lincoln to Canterbury, he states that Tenison "was well liked for having served the cure of St. Martin's, in the worst time, with so much courage and discretion; so that at this time he had many friends and no enemies"; but then Burnet might easily have believed himself a stronger candidate for the primacy. Yet we thought it had been understood that from being an active, learned parish priest, who had done his duty nobly in his resistance to reading King James's "Declaration of Toleration" in his church, he subsequently proved, like so many other men have done before and since, very unequal to the higher offices to which he was called. Certainly his reply to that excellent man Robert Nelson, when he entreated the Arch-

bishop's intercession with the King to spare Sir John Fenwick's life, suggests very painful reflections, whatever Dr. Stoughton may think of it (p. 240). "Laws *ex post facto* may indeed carry the face of rigour with them, but if ever [such?] a law was necessary, this is." We might grant the Primate's premises without admitting his conclusion. Laws *ex post facto* never can be necessary, because they must always do greater harm by way of setting evil precedents than they can promise good by the punishment of the guilty. The bill of attainder against Sir John Fenwick—pushed through the House of Lords by a majority of sixty-eight against sixty-one, mainly, we fear, through the votes of Tenison and his suffragans (p. 304), who ought to have withdrawn in a "case of blood," has been condemned by every constitutional writer, by every one calling himself an historian except Lord Macaulay. It never will be imitated again while public order reigns in England; it never has been imitated—and even then not to the taking of life—save in the bills of pains and penalties against Bishop Atterbury and the unhappy Queen Caroline.

To the Non-jurors Dr. Stoughton is not unjust—he cannot consciously be so—but he is naturally unappreciating. It seems to him such folly to be ever swimming against the tide; to have frustrated the designs of James because he assailed the Church which they loved better than the throne, and then to refuse to acknowledge William because he usurped the crown which had fallen from his relative's head. He applies to those who cling to the divine right of kings when the notion had become unfashionable, language which we should have imagined Professor Jowett too generous to have uttered:—

The great crises in the history of nations have often been met by a sort of feminine positiveness and a more obstinate reassertion of principles which have lost their hold upon a nation. The fixed ideas of a reactionary statesman may be compared to madness. He grows more and more convinced of the truth of his notions as he becomes more isolated, and would rather await the inevitable than in any degree yield to circumstances.

Assuming the principles which he maintains against all odds to be in themselves important, what else has an honest man to do? Obstinacy has a bad name, but it is near akin to some of the noblest qualities of our nature—to disinterestedness, steadfastness in adversity, faithful obedience to the voice of conscience. We will not plead strongly for Sancroft, whose culpable weakness in continuing the succession, and that against his own better judgment, produced a schism which languished feebly for nearly a century; we would rest our case upon Ken. Could any nobler or more seemly ending of a saintly life be conceived than that which he led at Longleat? So far from censuring those who had taken the oaths to the new sovereigns, he had almost been persuaded to follow their example; but he feared the future reproach of his own reflections, and, without one spark of passion or one resentful thought, withdrew from wealth and dignity to poverty and that dependence which lends poverty its worst sting. We know not how Dr. Stoughton can say that his successor Kidder paid him half the income of his abandoned see (p. 305). All we learn of the confessor's temporal fortunes would serve to prove the statement a mistake, although Kidder was haunted up to his sad death in the great storm of November 27, 1703, by the terrible suspicion that he was "eating poor Dr. Ken's bread." Yet it may be that in his deep retirement the expelled Bishop was more truly useful than when lodged in his stately moated palace at Wells. It is much that in a world wherein all save the best men hold their convictions but loosely and uncertainly, one of purer mould should stand forth at critical times to prove what may be done and suffered gladly for the sake of a quiet conscience. The Marian martyr Ridley, we suspect, made more converts to his creed at the stake than did the Marian fugitive Jewell at Paul's Cross or in his well-used study.

Our author spends his five concluding chapters (and they will seem to most readers the best, as they are the most original) on the great Nonconformist divines of the Restoration period, the generation that slowly died out in William's reign, and found none fit to take their places. And here, again, we note his spirit in the character of those upon whose praises he dwells most fondly. The stiff and somewhat surly virtue of Richard Baxter has fewer charms for him than the milder and more catholic temper of Bates and Howe. The aspirations after unity among all Christian people breathed forth by the latter win his especial sympathy, as well as the sharp rebuke dealt to the able but turbulent De Foe, who, in his *Enquiry into the Occasional Conformity of Dissenters*, in 1697, had complained of those Dissenters who at times attended church as persons of "an amphibious nature, who could believe one way and worship another" (p. 431). Even though a Churchman may deem ecclesiastical order in its proper place as necessary to be maintained as charity itself, we should not think highly of the man who could regard these motions towards union (if not in outward semblance, at least in mind and spirit) with any other feelings than those of thankfulness and admiration. Comprehension, in the sense in which Tillotson or Burnet might employ the term, we believe to be visionary. It would imply on the one side or the other, probably on both, too heavy a sacrifice of what seems to each to be the truth to be either acceptable or permanent. Not thus visionary is the prospect of gentle thoughts and friendly courtesy, in such wise as Dr. Stoughton affords us a model to emulate, subsisting in time to come between those who are separated from each other either by reason of deep convictions, or through the force of circumstances which have passed into history and cannot now be recalled. More than this must be

reserved for some purer state of moral and religious feeling than appears ever likely to be realized while human nature continues what it is.

We subjoin, as a favourable specimen of the author's manner, his general estimate of the theological literature of the Revolution period, which he contrasts with that of the preceding age by the fanciful comparison of the Gothic style of Westminster Abbey with the Renaissance or classical reproduction which finds its most prominent exemplification in St. Paul's Cathedral:—

A similar change came over poetry. It were an indignity to the great bard of the seventeenth century to compare him with any other than the great bard of the sixteenth. Milton's name is linked with Shakspeare's, but in the way of contrast. . . . The poet of the Renaissance succeeds the poet of romance. And this same Renaissance spirit worked its way into theological literature. Taylor and Bunyan, indeed all the great religious writers of the Commonwealth and the Restoration, appear more or less romancists in the style of their thoughts, regarded from a literary point of view. Divisions, pointedness, quaint expression, warmth of sentiment, such as arrests us in mediæval buildings, are reproduced in the books of that picturesque age. The two authors just mentioned belong to the class of romancist prose poets. But all is changed when we turn to the theological literature of King William's days—Tillotson, Burnet, Bentley, Locke. We miss Anglican and Puritan sweep of thought, minuteness of detail, intensity of utterance, and glow of passion. There is no depth of colour, all is pale; no flash of fire, all is cold. We meet with regularity, order, smoothness. It is the age of Renaissance in Divinity.

SHERIDAN'S WORKS.*

IT may be doubted whether there was any necessity for a new edition of Sheridan's works. There are already several editions which contain everything of Sheridan's that is worth reading, and the addition of what is not worth reading is hardly calculated to make the collection more attractive to reasonable people. It is cruel as well as foolish to reproduce all the trash which an eminent man may have thrown off in days of immaturity or idleness; but the editor of the book now before us has committed a more serious offence than this. He has gone out of his way to swell the volume with matter which is not only worthless but offensive. He has raked up some translations which Sheridan, while still a lad, composed in conjunction with a schoolfellow, and which he was foolish enough to publish. It is known that the original publication was a pecuniary failure, and it may be hoped that the present wanton and inexcusable reprint will share a similar fate. The "Love Verses of Aristænetus" are unrelieved by any flavour of wit or sentiment, nor does the style of the translation rise much above the level of the doggerel of the streets. There is, in short, nothing whatever to justify the raking up of this unclean rubbish from the oblivion in which it has for many years been happily buried. It was perhaps thought, however, that the incorporation of these impurities would impart to the book a peculiar flavour which would be likely to attract the attention of that class of readers for whom the same publishers have already been good enough to provide new editions of Tom D'Urfey, the *Museum Delicæ*, Walt Whitman ("The Complete Work," we are assured), and similar delicacies. It is possible that the titles and reputation of some of these publications may convey to most persons a sufficient warning of their character; but it is intolerable that a volume which might be introduced without suspicion to family reading should be deliberately tainted in this way. It is true that there are many things in Sheridan's plays which are coarse, and the manners of the age in which the plays were written made it natural that this should be so; but it is not of mere coarseness that we are now speaking. It is impossible to acquit the editor and publishers of this edition of Sheridan of a grave offence against literary decency. Nor do their offences, or at least the offences of the editor—for we cannot of course know how far the publishers are in this respect his confederates—stop here. Not only decency, but honesty, is outraged in this publication. We are presented with a Memoir of Sheridan, the authorship of which is not specified, but at the end of it we find the initials "F. E. S.," which we take to be those of the gentleman who on the title-page modestly calls himself editor. Mr. Stainforth may, in attaching his initials to the memoir, have meant to convey only that he has taken the responsibility of editing it; but to most persons the appearance of such a signature would suggest the idea of a claim to authorship. It has been remarked by a judicious critic that Mr. Stainforth tells us nothing new, but this is easily accounted for. In point of fact, this Memoir is composed of a series of extracts from Moore's *Life of Sheridan*, taken literally and bodily, and put together with hardly a syllable of connecting matter. Yet not a hint is given anywhere in the volume of the source of these appropriations. It may also be noted as a proof of the editor's carelessness, as well as recklessness, that we find one of the chalk drawings labelled "J. P. Kemble as Pizarro." If Mr. Stainforth had only taken the trouble to turn to the *Dramatis Personæ* given on another page, he would have learned, what we should have thought everybody knew, that Rolla was the part taken by Kemble, while Barrymore played Pizarro.

It would be manifestly unfair to subject such works as those of Sheridan to the test of a purely literary examination. It is not as an ordinary man of letters that he comes before us, but as a dramatist

and an orator. He wrote his plays in order that people might be amused by them when they were acted at the theatre, and he prepared his speeches with a view to their immediate effect upon the audiences to whom they were addressed; and he was eminently successful in making the desired impression in both cases. Two, if not three, of his plays are still among the most popular on the stage, and are continually repeated before audiences of our own day, who apparently find them as fresh and irresistible as Sheridan's own contemporaries found them when they were first produced. As for the speeches, there is good reason for believing that they were really effective at the time they were delivered. Byron is said to have declared in one of his rhapsodies that whatever Sheridan had done was always the best of its kind; that he had written the best comedy (*School for Scandal*), the best opera (the *Duenna*), the best farce (the *Critic*), and the best address (Monody on Garrick), and that, to crown all, he had delivered the very best oration (the Begum speech) ever conceived or heard in this country. There is of course a good deal of Byron's characteristic exaggeration in this assertion, for the *Duenna* is but a poor piece of work, and decidedly inferior to the *Beggar's Opera*, in imitation of which it was composed, and the Monody on Garrick is still and commonplace. But the *School for Scandal* and the *Critic* still remain the best pieces of their kind, in spite of the very obvious faults by which they are disfigured. The dialogue of the former is indeed somewhat blunted by being put into type, and requires the adroit emphasis of the stage to make it crackle properly; but the *Critic* is almost as amusing to read as to see acted. On every page we come upon familiar and almost proverbial passages, such as—"If it is abuse, why one is almost sure to hear of it from one d—d good-natured friend or other"; "the puff preliminary, the puff collateral, the puff collusive, and the puff oblique"; the clock that marks time at the opening of the play and "saves a description of the rising sun and a great deal about gilding the Eastern hemisphere"; "when they do agree on the stage their unanimity is wonderful"; "in a free country I'm not for making slavish distinctions and giving all the fine language to the upper sort of people"; Lord Burleigh's shake of the head, and the heroic dead-lock of uncles and nieces. It cannot be denied that Sheridan is weak in drawing character, and that the persons of his dramas are artificial types rather than actual human beings. Yet, though they may be unnatural in themselves, there are sufficient touches of human nature in their interchange of brilliant talk to justify their permanent popularity.

As to the merits of the famous Begum speech it is more difficult to judge. The plays are still acted, and we can observe the effect they produce. But the Begum speech may be said to have passed away as it was delivered, and we can form an opinion of it only by the evidence which we possess as to the impression produced by it at the time. There can hardly be any doubt that this impression was very deep and powerful. It threw the audience into a ferment of enthusiasm, and it was warmly praised by men who were certainly competent to express an opinion on such a subject. Burke in his grand way declared it to be "the most astonishing effort of eloquence, argument, and wit united, of which there was any record or tradition." But Burke had a weakness for superlatives, and an Irish way of saying more than he meant. Indeed we find him almost at the same time bestowing a similar panegyric on Sir Gilbert Elliot's impeachment of Sir Elijah Impey, "the most beautiful that ever was heard, divine beyond human sweetness," with other phrases which Minto was almost ashamed to repeat to his wife, begging her, "for God's sake," not to let any one else hear of them. It was apparently the fashion at this time, when there was more of personal parade in the debates, for the chief men on each side to applaud each other, as if to show how well they could afford not to be jealous of a rival's successes; and some allowance may be made on this account for the lavish praises which not only Burke, but Fox and Pitt, bestowed on Sheridan's oration. Sir G. Elliot mentions that the friends of Sheridan were indignant that Pitt, as soon as the great speech was finished, did not rise to say something handsome about it, and Pitt may on reflection have thought it politic to fall in with the enthusiasm of the moment. Fox, however, asserted twenty years afterwards that the Begum speech was undoubtedly the best speech ever made in the House of Commons, and a similar remark is attributed to Windham. Sir James Mackintosh, who heard the speech, and admitted the effect it produced, thought that the style was too gaudy to be well received in a later age; and Brougham has probably hit the mark in suggesting that a part of Sheridan's success was due rather to the speech having so greatly surpassed all the speaker's former efforts, the great interest of the subject, and the artistic elaboration and delivery of certain fine passages, than to the merits of the whole. No adequate report of this speech has been preserved, but we have the shorthand notes of the speech which he afterwards delivered on the same subject in Westminster Hall, and they certainly do not give one a very high idea of Sheridan's oratory. The style is not merely verbose and redundant, but flabby; the language is coarse and overcharged; and much of the wit is strained or trivial. It is known that Sheridan, with characteristic trickiness, endeavoured to add to the effect of his address by pretending to be quite unprepared, although he had been for days hard at work in getting up the case.

The prevalent notion of Sheridan at one time was, and perhaps to some extent still is, that he was a man of ready and abundant wit, who was too idle to discipline his use of it. In point of fact, Sheridan appears to have been naturally rather heavy and even dull, and to have been largely indebted to his industry, not only in working up such ideas as occurred to himself, but, in appropriating

* *The Works of Richard Brinsley Sheridan: Dramas, Poems, Translations, Speeches, and Unfinished Sketches. With a Memoir of the Author, a Collection of Ana, and Ten Chalk Drawings. Edited by F. Stainforth. London: Chatto & Windus. 1874.*

the ideas of others. Moore puts it mildly when he says that Sheridan had, in addition to the resources of his own wit, a quick apprehension of what suited his purpose in the wit of others. He was unscrupulous in his pilferings, and helped himself to whatever took his fancy. His famous remark about Pitt, when he was succeeded by Addington, leaving, like Theseus, "his sitting part" behind him, was got from Gilbert Wakefield, who supplied the quotation. In another instance, hearing Sir Philip Francis speak of the Peace as one "of which every one would be glad, and nobody proud," Sheridan hastened into the House to fire off the phrase as his own. Even those, however, whose jokes or epigrams he plundered in this way used to acknowledge that they were usually more successful from his lips than from their own. The leading idea in his Monody on Garrick is borrowed from one of Garrick's own prologues. The conception of Mrs. Malaprop is to be found in *Humphrey Clinker*. The charge which Snare flings at Sir Fretful Plagiary might with some reason have been applied to Sheridan himself, that he kept stray jokes and pilfered witticisms in his common-place book with as much method as the ledger of the Lost and Stolen Office. One of the sentences in his note-book is, "He employs his fancy in his narrative, and keeps his recollections for his wit." This was afterwards expanded into "When he makes his jokes you applaud the accuracy of his memory, and 'tis only when he states his facts that you admire the flights of his imagination"; and, with slight variations, served Sheridan on several occasions. Another well-worked joke was that about the gipsies disfiguring the children they steal, to which he helped himself in the first instance from Churchill. It turns up in the *Critic*, and was also used in the House of Commons. Some of his Parliamentary fustian was afterwards not inappropriately used over again for *Pizarro*. On the whole, it will be found that impudence and clap-trap form a large element in the sort of wit of which Sheridan was a master. He had a strong sense of humour and stage effect, but without taste or capacity for discrimination. His speeches and his plays are of much the same quality, and both are marked by audacious but successful hits, and by gross and amazing blunders. He had no self-respect to restrain him from committing himself to any escapade either in literature or politics, and was always ready to take his chance of hit or miss in pursuit of those sensational effects which flattered his vanity and gratified his love of excitement. High animal spirits and great plausibility gave force to intellectual qualities of a very moderate grade; and he had, in the midst of his looseness and dissipation, the curious faculty of concentrating on the particular object of the moment a sort of steady, mechanical industry. He was, in short, a rather plodding and heavy Beaumarchais, with all the tricks, but without the genuine brightness and originality, of the Frenchman.

MINTO'S CHARACTERISTICS OF ENGLISH POETS.*

SINCE M. Taine set the fashion of applying the comparative method to the history of a literature, each new essay in that department raises a faint expectation that we shall find traces of an example which ingenuity rendered so fascinating. We are prepared for a neat demonstration of the manner in which each writer was the result of his race, his milieu, and his epoch. The announcement in Mr. Minto's preface of a contrast in this respect between his plan and M. Taine's afforded us, therefore, a gentle surprise, not unmixt, it must be owned, with a sense of relief. Mr. Minto tells his readers that they must not expect to find the poets of whom he speaks treated with reference to their race or their social surroundings. M. Taine studied the organism through the medium; Mr. Minto is content to take the organism by itself, and to inquire what it is rather than how it was formed. At the same time he aims at something like an historical view; he seeks to trace how far each poet was influenced by his predecessors or his contemporaries.

This volume covers about three centuries of English poetry—from Chaucer, who died in 1400, to Shirley, who died in 1666. The obvious, if somewhat ungracious, question which a new book on such a question suggests is, What are the distinctive qualities which constitute its reason for existing? Mr. Minto's book appears to us to hold a middle place between a history of literature and a collection of essays or monographs. It is less systematic, less thorough in detail, and less compact in style than a serious history. Where Hallam and Mr. Minto go over the same ground—that is, from the fifteenth century onwards—it is interesting to compare them. Mr. Minto is not diffuse; but he has not Hallam's power of scholarly condensation, by which a paragraph is made to do the work of pages, and to give us the really important points and relations of a writer in the fewest, but most pregnant, words. On the other hand, Mr. Minto is incomparably lighter reading than Hallam, whose plan of course obliged him to suppress picturesque personal details. We are inclined to think that nature or circumstance has been kind to Mr. Minto in prompting him to adopt just this scale for his sketches. If the scale had been smaller, the sketches would, we suspect, have been meagre; if it had been much larger, there might have been an excess of talk, not so heavy as to be prosy, but occasionally verging on twaddle. In the chapter on Shakespeare's Life and Character Mr. Minto notices Malone's way of accounting for Shakespeare's knowledge of legal

terms by the conjecture that he may have been articled to an attorney at Stratford. Referring to the fact that, when Shakespeare was fourteen, his father mortgaged an estate at Ashbie, Mr. Minto observes that Malone's theory is superfluous:—

There are no family secrets from the children of the poor. Shakspeare doubtless heard the painful deliberations of his once prosperous parents, knew all their difficulties, and perused the mortgage bond with a boy's grave curiosity and awe.

Ingenuity of this kind often hovers on the line which separates the sublime from the ludicrous; and, for our part, we are glad that Mr. Minto's space did not often invite him to fill the gaps of biography with speculations of so subtle a texture. On the whole he has the merit of having written a book which, if neither exhaustive nor original, is fairly readable. It will tell people a good deal about some English poets whom, by a courteous fiction, all educated persons are supposed to know; and a little about several other poets whom the more ambitious few gladly affect to know. Whether a book of this sort is a good thing in itself is another question, and one which we should hesitate to answer in the affirmative. We are inclined to think that the books about good writers have multiplied to an extent which is becoming hurtful to real study of the writers themselves. By all means let us have thorough histories of literature, as well as careful sketches or outlines which will help beginners to keep clearly in mind the relative places and meanings of the books which they read. By all means let us have essays or studies in which particular writers or periods are thoroughly examined and illustrated. But what shall be said of the intermediate book—of one which, like the present, has the thoroughness neither of a history nor of a study? The very fact that it is easy and pleasant reading, and that it gives an intelligent general view of the writers with whom it deals, tends to its being used in practice, not as an introduction, but as a substitute. The slipshod knowledge thus picked up at second-hand may serve a turn for purposes of display, but is more fatal than anything else to largeness and truth of insight, and to the doing of sound work. It would be unjust to charge Mr. Minto with bookmaking. This volume shows not only a great deal of reading, but judgment and taste, notwithstanding a certain deficiency perhaps in that sense of humour which alone can make judgment or taste sure; but it would be just, we fear, to say that Mr. Minto is eminently fitted to be a source of "padding" to others. Any one, of course, who ever wrote,

Might stop a hole, to keep the wind away;

but it is something that there should be the necessity of first turning the noble material into clay; it is something that the user of the plug should have to make it for himself. Our objection is to the ready-made stop-gap; and it is a chatty, dilettante sort of book, like this of Mr. Minto's, neither thorough nor meagre, but just hitting the popular mean, which supplies that article in the most seductive abundance. The educational and the literary tendency of such a book is, in our opinion, to be deprecated. From the point of view of entertainment there is nothing to be said against it. It is well enough done in its way, though we do not think the way a good one; and it will pass time far more pleasantly, and at least more profitably, than scores of books which a dreary conventionality enboldens the Circulating Libraries to class as light reading.

The first chapter, on Chaucer, is one of the best. Chaucer has been somewhat neglected by "the general reader" of this generation, though scholars are now working at him with new vigour and new lights. In the ship of English Poetry he has been the figurehead, of which voyagers do not see much after they are on board. Mr. Minto justly points out that, though Chaucer may be called the "father of English poetry" in being the first great poet who wrote in English, yet the designation is apt to mislead. The originality which it seems to claim is too large. Original, no doubt, Chaucer was, and this in two senses; first, because his work has the impress and breathes the spirit of a strong individuality; next, because this kind of work had never before received a character or expressed a mind distinctively English. But Chaucer was not the founder of a new school of poetry. He was merely the apostle of that school for England. The Trouvères of Northern France derived their impulse from the Troubadours of the South. The Langue d'Oïl now essayed to rival those productions for which the Langue d'Oc had become famous. But the line of effort was changed in a significant way. The Southern Troubadours had been predominantly lyric. The Northern Trouvères aspired to be epic. They delighted in tales of chivalry, in romances of war or of love, in such heroes as Arthur and his Knights, Charlemagne and his Paladins—Charlemagne, whom no Mr. Freeman had arisen to upbraid them for calling a Frenchman. The Trouvères and the Italian poets who, like them, caught their first inspiration from the Troubadours, were directly the masters of Chaucer. When, indeed, M. Sandras describes him as a mere imitator, whether of Guillaume de Lorris or of Jean de Meun, he loses sight of that distinction, personal and national, which, as has been said, is so vividly stamped on Chaucer's work. But not the less is the intellectual parentage of his genius unmistakable—its strongest characteristic being perhaps that animation, that sentiment of bright colour, of fresh feeling, of rapid ease and gaiety of movement, in which De Quincey found the *Canterbury Tales* superior to the *Iliad* and the *Odyssey*. By the by, we are glad to see that Mr. Minto shows no favour to the crotchet which discovers a grim satirical purpose in the *Canterbury Tales*. Doubtless most of the personages are disreputable in the manner appropriate to

* *Characteristics of English Poets, from Chaucer to Shirley.* By William Minto, M.A. London: Blackwood. 1874.

their several stations and duties in life. The Merchant is of doubtful faith; the Miller steals corn; the Reeve is not above the temptations of office; the Cook is subject to nearly all the infirmities of the flesh; the Monk, the Friar, and the Pardoner are edifying rather as warnings than as examples; the Lawyer and the Doctor are not disposed to cavil at the view that the labourer is worthy of his hire. But these world-soiled pilgrims are, on the whole, a cheerful company, which the Poet joins solely with a view to their agreeable society, and not with the remotest design of taking notes for moral criticism. It is perhaps the best proof of Chaucer's force that nearly all the English poets of the fifteenth century may be regarded as his disciples, though the interval between the leader and the followers would now be estimated somewhat otherwise than it was rated by Skelton, when he could place Gower and Lydgate on a level with their master. Among the successors of Chaucer Mr. Minto rightly numbers Sir Thomas Malory, whose *Morte d'Arthur* was printed by Caxton in 1485. The *Idylls of the King* has lately revived the interest in Malory's prose compilation, and Mr. Minto's account of it will be acceptable to all readers of Mr. Tennyson. It will probably surprise many young ladies to learn that, whereas the Laureate's Arthur is before all things a Defender of the Faith, Sir Thomas's Arthur is, in several minor traits of his history, a decidedly objectionable person; though we quite agree with Mr. Minto that the eloquent apologist of the "Idylls," Mr. Hutton, undertook a work of supererogation when he addressed himself to showing that Mr. Tennyson's conception of Arthur is at all events nearer to Malory's than is Mr. Swinburne's.

In three centuries of literary history it is almost inevitable that there should be deserts—long, sandy tracts, with a sparse population of lyrists and translators; and a good deal of credit is due to the literary historian who proves himself an efficient dragoon in the passage of these arid districts. Mr. Minto gets over his "Renaissance and Transition"—the earlier and middle portions of the sixteenth century—pretty well; though, before emerging into a land flowing with the milk of Arcadia and the honey of Hymettus, there are moments when it would be a joy to desert in the distance even the most dismal of the Elizabethan Sonneteers. The ruling influences of this transition period were Italian. Sackville studied Dante; Gascoigne translated the plays of Ariosto and the prose of Bandello; Spenser owed much both to the *Orlando Furioso* and to the *Jerusalem Delivered*. It would have been well to have shown, more fully than Mr. Minto has done, the nature and the various bents of this Italian action on the literary mind of England—an action which, for more than a century later, continued to be so powerful; and it is just here that Hallam's special mastery of the subject might have given useful guidance. In the chapter on Spenser Mr. Minto has devoted some space to discussing a point in Thomas Campbell's criticism on the *Fairy Queen*. Campbell says:—"On a comprehensive view of the whole work, we certainly miss the charm of strength, symmetry, and rapid or interesting progress." Campbell, like Macaulay, had no doubt found the allegorical epic very long and somewhat dull, though he avoids suggesting, as Macaulay did in speaking of the "death" of the Blatant Beast, that he had not succeeded in getting to the end. But what, Mr. Minto asks, is Campbell's meaning when he denies "strength" to Spenser? The criticism certainly seems pointless, unless, with Mr. Minto, we suppose "strength" to mean "the strength arising from clearness and brevity of expression," i.e. lucid terseness. Remembering such passages as the visit of Duessa to Dame Night, and their journey to Ascalapian in the under-world, we must deem it an unhappy choice of language by which "strength," in the natural meaning of the term, is said to be absent from the *Fairy Queen*. The chapters on Shakspeare, his dramatic forerunners and successors, are well written, but present little that calls for special remark. In the Shakspearian part of them we were most struck by Mr. Minto's arguments for identifying the "better spirit" of the 80th Sonnet—

O how I faint when I of you do write,
Knowing a better spirit doth use your name

—with Chapman; a theory which seems to fit the conditions more satisfactorily than Massey's hypothesis that Marlowe is intended. The notices of Fletcher may perhaps be cited as especially good. Charles Lamb says that "quite a new turn of tragic and comic interest came in with the Restoration." But Fletcher may properly be considered as the real progenitor of the Restoration drama. As Mr. Minto says (p. 424), he threw into drama "not only the high spirits and daring manner of aristocratic youth, but also a sweet odour of poetry brought from the vales of Arcadia and the gardens of the *Fairy Queen*."

In taking leave of this pleasant book we have only to express a hope—which we feel sure that its author would share—that its readers will remember the significance of its title. Familiarity with the "characteristics" of a writer, however skillfully they may be set forth, is not the same thing as knowledge of the writer himself. This is particularly true in the case of poets. The best lessons which a poet has to teach are not literary, and no literary machinery can make a royal road to their acquisition. They can be learned only by apprehension of the poet's whole nature as expressed in his whole work. This book, *Characteristics of English Poets*, will be fulfilling its proper function only when it is used as an introduction and an aid to the sympathetic study of the poets themselves.

THE BEST OF HUSBANDS.

HITHERTO it has seemed good to Mr. Payn to describe himself upon the title-page of his numerous books only as the author of *Lost Sir Massingberd*. The practice of authors in this respect is the reverse of the practice of politicians. When the name of a statesman has become thoroughly familiar to us all, he changes it for a title. Whatever may be said on political grounds in favour of the practice, it must be admitted that both for contemporaries and for students of history it has its inconveniences. The great name of Pitt was partly eclipsed behind the title of Chatham, and there are a good many modern peers whose identity with former lawyers or statesmen has to be recognized by an effort of the memory. Authors, on the other hand, show their modesty by taking a title from their first publication, and only reveal their true names as they become better known. The change is probably agreeable to most of their readers. We seem to know a man better when we can call him Smith or Jones, instead of regarding him as a kind of impersonal abstraction. We could love Scott, while we had only a vague admiration for the author of the *Waverley Novels*. We may presume that when Mr. Payn discards the title under which we have hitherto known him, it is a symptom of growing popularity and a concession to the demands of a widening circle of readers anxious to have a more tangible object of worship. Perhaps, therefore, we ought to seize the opportunity of making a study of the works to which Mr. Payn now lays claim in his own character. We have reviewed so many of them that this would be a rather superfluous performance; and we shall only say that Mr. Payn has some decided merits which justify his popularity. We will not say whether it is to be reckoned amongst them that he does not aim at being profoundly philosophical or at gratifying the tastes of refined connoisseurs. But it is certainly a merit that he is always lively; that his plots are clearly constructed, and sometimes remarkably ingenious; and that he has a genuine sense of humour, marred—for we have no desire to conceal his weaknesses—by a reprehensible love of bad puns. The present story exemplifies these qualities fairly enough. It may perhaps be not incorrectly described as belonging to that class of fiction of which Mr. Wilkie Collins is the most popular master. There is, that is to say, a mystery which haunts us through a great part of the book; a skillfully compounded riddle, of which we feel that there ought to be a simple solution, and which we are yet unable to solve satisfactorily until the author himself places the key in our hands. Stories which depend for their interest upon the unravelment of a carefully constructed puzzle are of course despised by the more sublime critics, and it is true that they seldom gratify us by any delicate delineation of character and sentiment. When the puppets have to be worked exclusively with a view to conceal the secret strings which pull them, the performer is naturally tempted to overlook the demands of nature and probability. Accordingly, we must confess that, whatever other merits are possessed by Messrs. John and Richard Milbank and Miss Margaret Thorne—the principal actors in this little drama—they do not strike us as being very forcible representations of human nature. They have to act eccentric parts in order to conceal their secret motives from the reader; and it is consequently rather hard to account for some of their actions by the ordinary passions of humanity. Without letting out Mr. Payn's secret, we may endeavour to give some account of the situation, which, we would hope, may excite without satisfying the curiosity of our readers.

John and Richard Milbank, we may say, in the first place, are the regulation pair of brothers—the industrious and idle apprentice of Hogarth—the prodigal son and the virtuous heir; or, in short, the last representatives of the old-fashioned contrast on which a thousand different variations have been performed by as many novelists and writers of tracts. Generally speaking, the novel and the tract take different views of the merits of the question. Authors of tracts take the Hogarthian view of life, and show us the Mansion House as the final goal of the industrious lad's career, and Tyburn-tree at the end of his rival's history. The novelist more generally follows Sheridan, and asks our sympathies for Charles Surface, whilst we are fully prepared to detest the cold-blooded villainy of his hypocritical brother. Mr. Payn, however, in this case agrees with Hogarth. The prodigal brother, Richard, is a thoroughly bad fellow; whilst his brother becomes, not merely in name but in reality, the "best of husbands." We do not mean to say, however, that virtue is rewarded and vice punished, or to say the reverse; for to do so would be to let out the secret so carefully preserved. Thus much indeed must be added. Both Richard and John are in love with the model heroine who is supposed to possess all the virtues. And here occurs an example of the difficulty of which we have already spoken. If Mr. Payn had regarded simply the truth to nature of his story, he would have taken more trouble to explain to us how it comes to pass that the modest, refined, and exemplary Margaret falls in love with the scamp Richard. There is nothing, it may be said, surprising in the fact of an excellent young woman falling in love with a scamp, however worthless intrinsically, simply on the ground of his good looks and pleasant manners. That undoubtedly is quite true; but yet it is unpleasant in fiction, as it is unpleasant in real life, to watch a beautiful girl attaching herself to a thorough-paced scoundrel by reason of the very innocence which prevents her

from even guessing what a blackguard he is. But then the novelist ought to show us, what we are able to see more or less for ourselves in reality, what is the secret of the charm. We should listen to some of the villain's smooth speeches; we should have a taste at least of the wit and high spirits which make him a charming companion; and, though the author should never relent so far as to save his villain's soul, he should be careful to show that the serpent has at least glittering scales. Unluckily Mr. Payn is so intent upon showing the wickedness of the prodigal brother—a wickedness which is necessary to working his plot—that he forgets to exhibit his superficial goodness. He is from the first a drunkard, a gambler, and a debauchee; and not merely is he bad at heart, but his manners are as repulsive as his nature. When he meets his excellent brother, he abuses him in the coarsest manner; he does not even make a pretence of being touched by generous conduct; and, in short, he is so wantonly and outrageously brutal in his whole behaviour that we can only accept Margaret's love for him as a kind of mysterious infatuation. The fault is a considerable one; because it throws a preliminary air of improbability over a story which, whatever its other merits, can certainly not be praised on the score of its resemblance to ordinary life.

The two brothers are brought together by means of a spiteful will of an uncle; in regard to which we shall only say that it seems to us to illustrate the old proposal that novelists should combine to retain a consulting lawyer to keep them straight in legal matters. The two are forced to live together as partners for a year, during which the bad brother takes every possible means of insulting his more respectable relation. John sees that Richard is a brute of the very worst kind, and has yet only too good reason to know that Richard will in all probability marry Margaret at the end of the year. He knows, too, and indeed Richard does not scruple to proclaim to him in the plainest language, that the marriage will mean nothing but a miserable slavery to an unfaithful husband, and yet he considers himself bound in honour not to attempt to open Margaret's eyes. Certainly this is an uncomfortable situation, and when the year is nearly out and John discovers that Richard has committed a forgery, the temptation to the good brother to send the bad brother out of the country by a threat of imprisonment is a very strong one. He proceeds, in fact, to insist upon Richard's voluntary emigration to avoid prosecution; but here occurs the mystery of which we have spoken. Richard suddenly vanishes into thin air. After a time, John marries Margaret, who still prefers Richard but is urged to marriage by her sense of John's noble conduct in various ways; and John becomes the "best of husbands." But, though the best of husbands, he is not the happiest of men. Strange misgivings haunt us. What has become of the prodigal brother? Why does he never even ask for money, or turn up in a ruined condition? Why did John suddenly order a cellar to be bricked up? Could he, the best of husbands, have murdered his brother, and thus taken means to conceal the body? Why do mysterious lights appear at night in the neighbourhood of the said cellar? Why does John refuse ever to be a day absent from the house? Why does he get up at night and hold mysterious conversations with a man whom his wife discovers in the dim light to be one of the most blackguard companions of the missing brother? Why does that ruffian appear splendidly clothed and with pockets full of money directly after the conversation? Why does John, on the other hand, appear next morning with his dark hair turned grey in the course of a single night? What can he have been doing with a spade, a pickaxe, and a barrow in the little copse near the house where there is an old quarry? And what can he have wanted with that bottle of ink, invented by his ingenious father-in-law, and warranted to disappear suddenly at the end of a fortnight and leave nothing but blank paper? How are these questions to be answered? or rather how are they to be answered consistently with a belief that the best of husbands is really what he appears to be, and what indeed the novelist informs us that he really is?

To all which we can only answer that persons desirous of solving the riddle must read the book for themselves. We shall content ourselves with drawing what appears to be the most obvious moral. If you have a brother who is a thoroughly black sheep, cut him off as decidedly and speedily as possible. If you find him out in a forgery prosecute him at once; and if you have reason to suppose that he is in love with the object of your own affections, take care that she knows all about his misdeeds as quickly and fully as possible. Otherwise, however exemplary may be your own conduct, you will find that your own relation may be a thorn in your side throughout life, and you may even die a melancholy death yourself, though you may marry the woman of your heart and be to her the best of husbands.

FRIENDS OF CHATEAUBRIAND.

(Second Notice.)

THE second volume of Sainte-Beuve's work on Chateaubriand and his "groupe littéraire" is chiefly occupied with matter relative to those friends of his who had a direct and appreciable influence on his production. One or two of these had the combined influence of the critic and the friend, and there is a passage

of remarkable interest about criticism which throws a strong light upon what Sainte-Beuve thought of his own craft:—

Le don de critique véritable n'a été pourtant accordé qu'à quelques-uns. Ce don devient même du génie lorsqu'on milie des révolutions du goût, entre les ruines d'un vieux genre qui s'écroule et les innovations qui tentent, il s'agit de discerner avec netteté, avec certitude, sans aucune mollesse, ce qui est bon et ce qui vivra.

La nature crée le grand critique, de même qu'elle confère à quelques hommes le don du commandement. D'autres influent plus sensiblement, s'agitent, débordent, entraînent: le vrai juge, le vrai critique, par quelques mots, rétablit la balance. En philosophie, en politique, de nos jours, nous avons vu bien des talents qui étaient des puissances, des forces toujours en action et en mouvement: M. Royer-Collard, tranquille et debout, était une autorité.

L'autorité du vrai critique se compose de bien des éléments complexes, comme pour le grand médecin; mais on foud il y a là un sens à part, comme le tact d'un Hippocrate ou d'un Corvisart.

All this, and more to the same purpose, about the natural gifts of the critic, is both perfectly true and in direct contradiction to the notion so prevalent amongst literary and other artists (novelists, poets, painters, &c.), that it is much easier to criticize than to execute. The criticism which throws a flood of daylight on a work of art, showing it exactly in its right place and relation to other works of art, and which does this *at once*, without waiting to hear the verdict of public opinion, yet does it so accurately that the future can but confirm the verdict—this kind of criticism is much rarer than good art is, and therefore, it may be presumed, is at least equally difficult, whilst it certainly requires uncommon natural gifts and an immense amount of experience and information. The mark of good criticism is that it does not deal in safe and moderate generalizations, but goes boldly into detail, and both praises and blames without softening for fear of being wrong:—

Il ne s'agit pas, quand un nouvel écrivain paraît qui est un homme de génie, même avec des défauts,—il ne s'agit pas de venir dire: *C'est assez bien*, et de faire ce qu'on peut appeler une cote mal taillée des beautés et des défauts, comme fit l'Institut dans ce fameux Rapport sur le *Génie du Christianisme*, comme fit l'Académie pour le *Cid*. "C'est un grand signe de médiocrité de louer toujours modérément," a dit Vauvenargues. Il faut savoir à première vue marquer le cran. Quel mépris n'avait pas La Bruyère pour ces prétendus connaisseurs qui avaient en sous les yeux le manuscrit de ses *Caractères* sans bien savoir à quoi s'en tenir et sans oser se prononcer.

Fontanes, who was timid as a poet, criticized frankly and well, and had a salutary influence on Chateaubriand's earlier style, which Chateaubriand willingly acknowledged; but, as Fontanes did not live long enough to be always by the side of his friend, this influence was wanting to bend in his decline. Fontanes had a strangely complex character. He was a poet, or at least an elegant versifier, and in his verse, which is evidently quite sincere, he writes delicately and charmingly of his rural life, of the advance of age, and such subjects as would have been chosen by the lyric poets of antiquity, and very much in their tone too, yet not in servile imitation. At the same time (no one would have guessed it from his poetry) he was really a strong and authoritative critic, and a fine orator. M. Thiers in his History says that Fontanes in his oratory spoke the finest language which had been uttered since the time of Louis XIV., and Sainte-Beuve believes that this praise, however high, is just. Then, in addition to these talents, Fontanes possessed personal qualities that won the esteem and confidence of Napoleon I., a severe and capable judge of men, and the very last person in his age to be imposed upon by merely literary gifts, for which, as is well known, he had a feeling bordering upon contempt. Let us add to these traits a curious detail, necessary to complete the portrait of the man. Fontanes had a strong touch of the epicurean in his nature, and had a good and "active" stomach (the adjective is his own), which he gratified by means of those varied and excellent repasts which a Frenchman in easy circumstances, who is not at the same time both *gourmand* and *gourmet*, knows so well how to order and procure. His touch of sensuality does not seem to have been entirely confined to good eating, for, as he dared to confess, "Je ne sais rien de plus agréable qu'un ballet bien indécent après un bon dîner." Sainte-Beuve quotes specimens of his poetry, written exactly in the tone and temper of Horace, yet quite his own. Here are three stanzas, beautifully finished in their way:—

Au bord de ce fleuve limpide,
Le long de mes prés toujours verts,
Si quelque rimeur insipide
Portait son orgueil et ses vers,
Qu'en faisant leur ronde fidèle,
Mes Fontanes en sentinelle
L'écartent d'un bras redouté
Même quand la troupe immortelle
Dans l'Institut l'eût adoptée.
Mais si Joubert, ami fidèle,
Que depuis trente ans je chéris,
Des cœurs vrais le plus vrai modèle,
Vers mes champs accourt de Paris,
Qu'on ouvre! j'aime sa présence;
De la paix et de l'espérance
Il a toujours les yeux serens.
Que de fois sa douce éloquence
Apaisa mes plus noirs chagrins!
Et si, de ses courses lointaines,
Chateaubriand vient sur ces bords,
Muse de Sion et d'Athènes,
Entonnez vos plus beaux accords!
Qu'au bruit de vos airs postiques,
Accueilli comme aux jours antiques,
Il prenne place en mes foyers,
Et loin des trahisons politiques
Repose eint de vos lauriers!

* Chateaubriand et son groupe littéraire sous l'empire. Par Sainte-Beuve. Nouvelle édition. Paris: Lévry.

The Joubert mentioned in the second stanza is the subject of one of Mr. Matthew Arnold's essays, and most readers who care for what is delicate and refined in French literature will be acquainted with the fragments of Joubert's writing which have been preserved and published by his friends. He also had an influence on Chateaubriand, but quite a different kind of influence from that which Fontanes exercised. The two friends are described as follows by Sainte-Beuve:—

Chateaubriand, jeune, marchait entre les deux. Jamais poète ne trouva deux critiques plus doués d'imagination eux-mêmes, deux critiques amis mieux faits en tous points pour se compléter l'un l'autre et pour le servir. Si l'un, tout classique, l'accompagnait et le soutenait avec un dévouement étonné, l'autre ne s'étonnait pas du tout, et devançait toujours. L'un, ferme et net, athlète au besoin, brisait des lances dans les mêlées pour son ami, et le couvrait de son bouclier; l'autre, vrai sylphe, pur esprit, presque sans corps, voltigeait en murmurant à son oreille des conseils charmants, *l'ami suave*. L'un, critique devant le public, plaidait, défendait, et gagnait une cause; l'autre, intime et inspirant au dedans, suggérait mille pensées et insinuait bien des hardiesses; et pour finir par un mot consacré, l'un était la bride et l'autre l'éperon.

Joubert was a perfect idealist, a man of weak unproductive temperament, fond of dreaming, and who had cultivated in himself the most sensitively delicate taste. "Ses jugements littéraires," says Sainte-Beuve, "étaient d'une ténuité, d'une subtilité, et d'une élévation qui, aujourd'hui même, pourrait faire frémir les classiques de seconde main." Sainte-Beuve calls him "Joubert le délicat," and in this single epithet characterizes him as accurately as one word possibly could do. Joubert was constantly occupying his mind with literary subjects, though incapable of the labour of composition, which fatigued him so much that he was obliged to limit his writing to occasional notes and memoranda. His power of conversation seems to have been considerably superior to his literary productions, for the most lively and intelligent men listened to him without impatience. There was in Joubert's mind that perfume of culture and taste which is always an irresistible attraction to men of genius, even when their genius is not so delicately fastidious as the taste whose criticism they value. It is more by the teachings of these rare spirits than by their own independent faculty that more vigorous minds attain to the appreciation of what is exquisite. They are like electrometers, or test-papers, which reveal what coarser faculties could not discover for themselves, and it is an important part of education to have known them:—

En avoir une fois connu un de ces esprits divins, qui semblent nés pour définir le mot du poète: *divina particulari aura*, c'est être dégoûté à jamais de ce qui n'est pas fin, délicat, délicieux, de tout ce qui n'est pas le parfum et la pure essence; c'est se préparer assurément bien des ennuis et bien des malheurs.

Another intimate friend of Chateaubriand was Chénedollé, to whom Sainte-Beuve gives, as it seems to us, a degree of space rather out of proportion to the interest of the subject. Sainte-Beuve's method of arranging literary material had sometimes the defect of displaying the material itself with too complete a forgetfulness of his own personal rôle as a literary artist, so that we have many pages in which the critic is scarcely apparent; and this is the more to be regretted since his own observations are generally much more interesting than the passages from letters and other compositions which he thinks it necessary to quote. Chénedollé was simply a man of refined and poetical tastes who led a philosopher's life, and knew some of the greatest literary people of his time. We confess to a great ignorance of his poetry, which is no longer read except by curious students of an age that has passed away, but the specimens of it here given are not especially encouraging. It is simply versification, seriously ambitious, yet not rising into poetry. We greatly prefer the verses of writers like Fontanes, who compose elegantly, and with a certain lightness of touch, though they may not have such exalted aims. There is a place in literature for the elegant and skilful versifier as distinguished from the poet, but there is scarcely room for the writer who aims at poetry and does not quite succeed. Chénedollé's verses pleased Joubert, but then Joubert was careful to say that they pleased him like moonlight. Yes, that is exactly the degree of heat and light they give. Compared with the work of men endowed with the true fire, they are as moonlight to sunlight, as water to wine. Of the passages quoted by Sainte-Beuve, the following description of a frost in April is the best. It is delicately true, and written by one who had lived much in the country, and taken a constant interest in rural things:—

Le froment, jeune encor, sans craindre la faucille,
Se couronnait déjà de son épi mobile,
Et, prenant dans la plaine un essor plus hardi,
Ondoyait à côté du trèfle reverdi;
La cerisaie en fleurs, par avril ranimée,
Emplissait de parfums l'atmosphère embaumée,
Et des dons du printemps les pommiers enrichis
Halalaient leurs rameaux empoivrés ou blanchis.
Mais du noir, tout-à-coup, les horizons rougissent,
Le ciel s'est coloré, les airs se refroidissent;
Et l'étoile du Nord, qu'un char glacé conduit,
Étincelle en tremblant sur le front de la Nuit.
Soudain l'âpre Gölée, aux piquantes haleines,
Frappe à la fois les prés, les vergers et les plaines,
Et le froid Aquilon, de son souffle aéré,
Poursuit dans les bosquets le Printemps éploré.
C'en est fait! d'une nuit l'haleine empoisonnée
A séché, dans sa fleur, tout l'espoir de l'année.

Sainte-Beuve thinks that Chénedollé's misfortune was to live too much away from Paris, because it is so difficult to make a literary reputation in the country. Books by themselves, Sainte-Beuve

says, are nothing or little towards the establishment of a reputation; the author ought to be personally present to sustain them, and dispose those who are indifferent to read them. In this perhaps there is some exaggeration of a kind natural to a Parisian, but there is some truth in it, especially in the case of men of mediocre talent, whose works are not strong enough to do without the help of *camaraderie* and the influences of drawing-rooms. By personal influence in the capital, a man of Chénedollé's talent might have won higher reputation, but the great poets may live where they like; their books make their fame for them. In our own country several poets of eminence have lived habitually out of London. A more serious objection appears to have been that Chénedollé was not lucky in the time chosen for the publication of his works. He did not publish till Lamartine and Victor Hugo had won the public ear, and it needed a stronger genius than his to contend successfully against these rivals. It is exceedingly interesting to study the cases of men who have been unsuccessful, and to ascertain the causes of their failure. Sainte-Beuve thinks that at least a remembrance is due to Chénedollé, and that he deserves some attention as "un homme distingué par le talent et par le cœur, qui eut en lui l'enthousiasme, le culte du beau, la verve sincère, les qualités généreuses, et jusqu'à la fin cette candeur des nobles âmes qui devrait être le signe inaltérable du poète."

Chénedollé, like the majority of poetical minds in the earlier part of this century, felt, in all its strength and novelty, that passion for external nature which has had so great an influence on modern literature. Like most of his countrymen, he enjoyed nature more from the classical and rural point of view than from that delight in uninhabited sublimities which has marked the English passion for noble scenery. His very name is that of a pond which he loved in childhood. He remembered later the entranced pleasure with which, at the age of nine, he would pass hours together on a balcony, looking at the slopes of Barcy. He observed nature with the most constant attention, and took an unfeigned interest in all rural occupations. The following is an extract from one of his note-books:—

J'aime tous les travaux champêtres; j'aime à voir labourer, semer, moissonner, planter, tailler, émonder les arbres, aménager les forêts.
Je jouis du blé vert, et j'en jouis en moisson.
En mars, je ne connais rien de beau, de riant, de magnifique, comme un beau champ de blé qui rit sous les premières haleines du printemps.
Depuis trente ans, je m'occupe de l'étude de la nature. Je m'observe sans cesse, je m'étudie sans cesse à la prendre sur le fait.

It was characteristic of Chénedollé that he congratulated himself on having learned Greek late in life:—"Cela présente la pensée sous de nouvelles couleurs et ouvre à l'esprit de nouveaux horizons. L'étude d'une langue, surtout d'une langue très-riche et qui a de belles formes, retrempe et rajeunit l'imagination."

Chénedollé knew several very interesting people, and amongst the rest he knew Rivarol, the astonishing talker. Nothing in the way of brilliant improvisation ever exceeded, if we may believe those who knew him, the torrent of talk that poured from this man's lips. Chénedollé Roswellized him a little, and has preserved specimens of his talk which unquestionably display great intellectual agility. Rivarol seems to have made regular discourses, giving himself a subject to start with, in the form of a defined proposition, on which he lectured with the greatest eloquence, and an absolute intolerance of every other talker. He must have been at the same time a remarkable intellectual curiosity, and a great bore. Here is a vivid description of Rivarol's manner, written by Chénedollé himself:—

Il commençait en effet, et se lança dans un de ces monologues où il était vraiment prodigieux. Le fond de son thème était celui-ci: Le poète n'est qu'un sauvage très-ingénieux et très-animé, chez lequel toutes les idées se présentent en images. Le sauvage et le poète font le cercle; l'un et l'autre ne parlent que par hiéroglyphes, avec cette différence que le poète tourne dans une orbite d'idées beaucoup plus étendue—et le voilà qui se met à développer ce texte avec une abondance d'idées, une richesse de vues si fines ou si profondes, un luxe de métaphores si brillantes et si pittoresques, que c'était merveille de l'entendre.

Il passa ensuite à une autre thèse qu'il posa ainsi: L'art doit se donner un but qui recule sans cesse, et mettre l'infini entre lui et son modèle. Cette nouvelle idée fut développée avec des prestiges d'éloquence encore plus étonnants: c'était vraiment des paroles de kérié. Nous hasarâmes timidement, M. de la Tremé et moi, quelques objections qui furent réfutées avec le rapide dédain de la supériorité (Rivarol, dans la discussion, était osant, emporté, un peu dur même)—"Point d'objections d'enfant," nous répétait-il, et il continuait à développer son thème avec une profusion d'images toujours plus éblouissantes. Il passait tour à tour de l'abstraction à la métaphore, et revenait de la métaphore à l'abstraction avec une aisance et une dextérité inouïes. Je n'avais pas d'idée d'une improvisation aussi agile, aussi svelte, aussi entraînante. J'étais toute oreille pour écouter ces paroles magiques qui tombaient en reflets pétillants comme des pierrieres, et qui d'ailleurs étaient prononcées avec le son de voix le plus mélodieux et le plus pénétrant, l'organe le plus varié, le plus souple et le plus enchanteur: j'étais vraiment sous le charme, comme disait Diotot.

Chénedollé had the fault of procrastination. He allowed himself too easily the dangerous luxury of leaving things half done in the expectation that they would be finished some time. "Chénedollé écoute trop le *Démon de la procrastination*, comme on l'a appelé. Il n'invoque pas assez la *Muse de l'achèvement*, cette muse heureuse, la seule qui sache nouer la couronne." This characteristic is the common one of second-rate intellects when not compelled to produce by the necessity for daily bread. They easily fall into habits of dreaming, not having the great productive energy of the real geniuses, and never feeling perfect confidence in the value of what they do. Chénedollé was in the French University, and first Professor of Literature at Rouen, after which he became *Inspecteur d'Académie* at Orléans. He knew Joubert well, and Joubert wrote interesting letters to him, in which were such

good and profitable things as Joubert could think and express better than anybody else. Here is a charming passage of a letter addressed to Chénedollé when he accepted the functions of Inspector. Joubert says that he would have preferred for his friend the uniform and fixed labour of a teacher, on account of the tediousness of detail in the work of an Inspector. However, he continues, there is a sure way of reconciling ourselves to our duties:—

Je vous préviens qu'il y a deux moyens infallibles de s'y plaire : le premier est de les remplir parfaitement ; car on parvient toujours à faire volontiers ce qu'on fait bien ; le second est de vous dire que tout ce qui devient devoir doit devenir cher. C'est une de mes anciennes maximes, et vous ne sauriez croire quelle facilité étonnante on trouve dans les travaux pour lesquels on se sentait d'abord le plus de répugnance, quand on s'est bien enquis dans l'esprit et dans le cœur une pareille pensée ; il n'en est point (mon expérience vous en assure) de plus importante pour le bonheur.

Again, towards the conclusion of another of his letters, he says, "J'éprouve que rien n'augmente le découragement autant que l'oisiveté."

Although Chénedollé had the greatest regard for Joubert, he did not see him frequently, and the last of their separations extended over the wide space of twelve years, Joubert dying immediately after. Chénedollé was very intimate also with Fontanes, who most kindly gave much time and trouble to the detailed criticism of his literary work before it reached the public. We get other glimpses of Fontanes through Chénedollé's letters. He speaks of his admirable powers of conversation, which was as fertile and abundant as that of Rivarol, yet in better taste. Fontanes allowed himself full play in his conversation, and tried his powers by talking before he sat down to write, when he became much more severe with himself, and obeyed the inward law of the strictest self-criticism. His friend observes that his mind threw off images and material most abundantly when he corrected the manuscript of some less experienced writer than when he composed on his own account. His notion of taste was so extremely delicate and severe that he became rather timid when he wrote his own poetry, but when he had only to suggest new matter to a friend, he was perfectly inexhaustible. "Barthe, en arrivant chez lui, lui disait : 'Je viens vous demander de la matière poétique ;' et Barthe avait bien raison, car il en donnait tant qu'on voulait." In conversation his audacity of imagery sometimes went rather dangerously far, and there is a capital anecdote in illustration of this. One day he was glorifying Paris and France, and exclaimed—

Babylone! Thèbes aux cent portes!—Londres n'est que la ville des marchands, ce n'est qu'un grand comptoir. Paris est la ville des arts et des rois. Babylone! Thèbes aux cent portes! Voyez-vous Louis XIV assis sur la plus haute des cheminées du palais de Versailles? Le voyez-vous qui commande à tout son siècle? Et alors il faisait la description la plus vive, la plus animée, des merveilles de ce règne, des arts, des talents des génies qui y rivalisaient d'éclat et de grandeur.

This image of Louis XIV. sitting on the top of the highest chimney at Versailles, and thence commanding "tout son siècle," is one of the most charming instances of ridiculous sublimity we ever met with. Yet the energy and conviction of a man like Fontanes are enough to carry off even such imagery as this. Chateaubriand and Chénedollé used to call Fontanes "le Sanglier d'Erymanthe," on account of his brusquerie and verve, and Chateaubriand declared that the wild boar in the garden of the Tuileries, le Sanglier de Culydon, was his portrait.

ROBY'S LATIN GRAMMAR.*

(First Notice.)

AFTER an interval of three years Mr. Roby has brought out the second and concluding part of his Latin Grammar. For an account of the first part we must refer our readers to the *Saturday Review* for September 30, October 7, and October 14, 1871. We there contrasted Mr. Roby's philosophical method of investigating grammar with the cut and dried style of the *Public Schools' Latin Grammar*, and the present instalment of the work fully bears out the opinion we expressed as to the comparative merits of the two publications. The Fourth Book, of which the present volume consists, is wholly devoted to Syntax, to which is added a long supplement which treats of prepositions and quasi-prepositional adverbs and particles, &c. But before we begin to give any account of it, we must premise that few people will find the same amount of interest in this as in the previously published volume. It required small knowledge of the language, or of its grammar, to follow Mr. Roby through his observations on orthography, and on the inflexions of nouns and verbs. But no one will find the Syntax to be easy reading, and even expert grammarians will often be driven to have recourse to the numerous illustrative examples which are added, before they will understand the full force of Mr. Roby's somewhat novel classifications. He is himself fully aware of this difficulty, and in view of it he says in his preface:—

I have desired to set example above precept, and to appeal to the intuition of my readers, rather than to their power of abstract grammatical conception. A writer on language has herein a great advantage over expositors of many other branches of science, that he can incorporate in his work

actual specimens of the natural objects. I have made full use of this advantage, and aimed at giving my book the form, not so much of a treatise as of a scientific arrangement of specimens interwoven with a *catalogue raisonné*. For this puts grammar in the proper light as an account of what men do say, not a theory of what they should say. Moreover, few except practised grammarians can get a clear conception from grammatical exposition except as a commentary on examples, and as a clue and justification for the arrangement of them.

The term *catalogue raisonné* is not well chosen as descriptive of the matter which is interspersed with the specimens; and though the writer regards the illustrative portion as given rather from an historical than a scientific point of view, we think we may safely say that it is all the more scientific because of the regard which has been had to the historical development of the language. For, as Mr. Roby justly observes, matters which appear utterly unintelligible when their historical pedigree is left out of the account unfold themselves naturally and simply "when we look along the line of growth."

The Syntax, which occupies the Fourth Book, that is to say, the greater part of the volume, is arranged in twenty-three chapters, which the author has further helped us in the introductory remarks prefixed to it to classify as follows:—

CHAR. I.-IV. describes the names and functions of the several parts of speech, the classification of sentences, the order of the words in a sentence.

CHAR. V. XIV. gives the use of noun inflexions, partly arranged so as to present a continuous reading of the text on the left hand side page, with the notes opposite to it on the right.

CHAR. XV.-XXIV. contains the use of verb inflexions, part of it being arranged in a similar manner.

There is perhaps no more difficult subject to treat in the way of laying down rules than the arrangement of words in sentences. It is here that refined scholarship is seldom at fault, but the best Latin writer would scarcely be able to give the exact reasons for a given order of words in a sentence he had written, simply because his choice had been guided by instinct and not by reason. The chapter which discusses this subject is perhaps one of the least satisfactory portions of Mr. Roby's Second Part. It scarcely exceeds six pages in length, and might perhaps with advantage have been supplemented with many more examples, especially under the head of Rhythm, which, at least in Cicero's orations, takes precedence of almost every other consideration. We have no right to find fault with an author for suggesting a division which is not strictly logical, when none could have been made which would rigidly answer to logical tests. Yet when, after stating that the order of words is not fixed by any invariable rule, Mr. Roby proceeds to mention the three requirements of "facility of comprehension, emphasis, and rhythm," we are tempted to demur to the distinction drawn between the first two; for though rhythm will sometimes require a different order from that which would best correspond to facility of comprehension, it is scarcely possible to detach the idea of emphasis from that of facility of comprehension, except indeed where emphasis is connected, as it so frequently is in Tacitus, with such omission of words as renders the sentence obscure. One instance of the violation of a rule which comes under this head of facility of comprehension, as given by Mr. Roby, will illustrate what we mean. Relative pronouns regularly stand at the commencement of their clause. This rule, by the way, seems to us somewhat superfluous, as no one would ever have imagined them ordinarily standing anywhere else. But he notices as exceptional the following instance of an emphatic word being placed before the relative:—

Roman quæ apportata sunt, ad ædem Honoris et Virtutis vidimus.

Now undoubtedly the word *Roman* is emphatic, but facility of comprehension is not violated, but very much increased, by the arrangement, which is evidently the most natural possible, there being implied in the word the antecedent of the relative *quæ*.

Under the first head we have no fault to find with the rules given, but the poetical exceptions which have been selected are a very inadequate representation of the mode in which the requirements of verse interfere in the Latin poets with the natural order of words as they would have been arranged in prose. The few instances adduced are not indeed badly chosen, but they give, and perhaps Mr. Roby meant them to give, examples of what may occur, and indeed must frequently occur, in the verses which boys make at school. *E.g.*

Ponitur ad patrios barbara præda deos

is of course quite a typical pentameter. So

Solus avem cælo dejecit ab alto

exhibits quite a common arrangement. But we should have been glad to see instances of the principle of arrangement as sacrificed in more glaring instances. Such, for instance, as Horace's

ludo fatigatumque somno ;

and, again, in the same ode two lines further on:—

texere, mirum quod foret omnibus.

Again, under the head of "facility of comprehension" we are told that "in many expressions the order of the words is fixed by custom." This is undoubtedly true; but it would have been more natural to make a separate class of arrangements which are customary rather than to class such expressions under the head of a rule of which it is difficult to say whether they are instances or exceptions.

As to the observations upon Rhythm and the illustrative examples, we can only say they fairly beat us. None of the examples selected appears to us to be particularly rhythmical, and

* *A Grammar of the Latin Language, from Plautus to Suetonius.* By Henry John Roby, M.A., late Fellow of St. John's College, Cambridge. In two Parts. Part II. containing Book IV., Syntax. Also Prepositions, &c. London: Macmillan & Co. 1874.

we scarcely see how they apply to the two general observations to which they are appended. We have no other means of judging, but they suggest to us that the author has not any very distinct perception of cadence. If he had transcribed the opening sentences of the speech for the poet Archias, his readers would have understood how, at least in an oration, attention to rhythm produces a most wonderful effect. And why he should have fixed upon certain adverbs, *nam, enim, &c.*, to tell us whether they may or may not begin a sentence, and omitted to notice others, as, for instance, the conjunctions *que* and *autem*, we are quite at a loss to determine.

On proceeding to the use of noun inflexions, which occupies the second part of the Syntax, we find the cases are separately treated, beginning with the nominative and ending with the genitive. We select the dative, not as being the most important point, but because it is not treated at such great length as the other cases are, and we shall be able to criticize it more easily within a brief compass. The two senses in which Mr. Roby says it is used are:—

- A. To express the *indirect object*, which is usually a person.
B. *Predicatively* in a quasi-adjectival sense.

Most readers will require some explanation of this distinction, and possibly it may be thought that it is a distinction, not indeed without a difference, but scarcely warranted by any advantage that accrues from its consideration. The difference of the relation in which the noun in the dative stands to the rest of the sentence from that in which the genitive occurs is most justly described, but it does not appear to us to bear out the text to which it is appended as a note. We do not see why the indirect object should be described as usually a person just because it is more often a person than a thing. But Mr. Roby shall speak for himself:—

A. (1.) The indirect object is the person (or thing) affected by the occurrence of an action or by the exercise of a quality, although not directly or primarily acted on (person from or to whom).

The word put in the dative belongs properly to the whole predicate (whether principal or subordinate), and not (as the genitive) to some particular word, though there is often some word in the sentence (e.g. verb, adjective, preposition in composition, substantive) whose meaning is naturally supplemented by such an indirect object.

The Augustan and later writers, especially poets and historians, often employed the dative to express loosely but vividly what as a more matter of fact would be more precisely expressed by a preposition with its case.

Now it seems to us that Mr. Roby, in describing this indirect object as usually a person, is straining a point for the purpose of exhibiting a distinction between this use and the other, which he has marked (B) and which he speaks of as a dative of the thing. The instances which he gives are numerous, and the dative of the person occurs more frequently than that of the thing, but no principle is involved in this fact, if fact it be. Take one of the instances he has himself given:—

Seire volam quantum simplex hilarisque nepoti
Discrepet et quantum discrederet paucis avaro.

Surely if the expression had been in prose instead of verse, and the comparison had been instituted in the abstract instead of the concrete, between the qualities instead of the persons possessing them, the same construction might have been used.

The other use of the dative is described as follows:—

B. Predicative dative: that which a thing (or person) serves as, or occasions.

And here the note of explanation is exact and philosophical:—

Usually a semi-abstract substantive, always in the singular number, and without any attribute except sometimes *magnus, major, minor, maximus, summus, nullus, tantus, quantus*, and (chiefly in Plautus) *bonus*. In this use the dative approximates to an adjective, the superlative of which is found by the addition of *magnus, &c.*

A personal dative is generally added (as indirect object). Instances of this use are arranged under two heads:—

1. With the verb *esse*, such as—

Nec tamen impeditur id rebus gerendis fuit.
Ea res nemini unquam fraudi fuit;

and

2. With *habere*, *dacere*, *dare*, &c., and (but *auxilio, praesidio, subsidio* only) with verbs of motion, &c., as—

Paupertas probro haberi, innocentia pro malivolentia duci cepit,

and

Equitatum auxilio Cesari miserant.

A distinction is drawn between this class of dative and one which occurs in a subdivision of (A), which is described as the dative "of work contemplated, chiefly verbal substantives, especially gerundival expressions dependent mainly on substantives or *esse*," of which the following are instances:—

Q. Fabius comitia censoribus creandis habuit
Hunc sibi domicilio locum delegerunt.

Now give it in Mr. Roby's own words:—

The difference of these datives from those of the class B § 1158 sqq., is shown by the fact that these (in theory at least) are convertible with genitives, those with predicative nominatives or accusatives. The former express a sphere of operation, the latter express the light in which a thing is viewed, or the character which is ascribed to it. Both are connected more or less with substantives in the sentence; but in the former their substantive is rather governing than governed (e.g. *dies colloquio*, a day for a conference, a conference day); in the latter, rather governed than governing (e.g. *navis exitio*, ruin or ruinous to sailors).

An illustration occurs in

Extremo prioris anni comitia auguris creandi habita erant,
where the genitive is actually used in place of the dative.

Our remarks on this small portion of the Grammar have extended to so great a length that we must reserve for a future occasion some notice of the verbal inflexions, especially those of the subjunctive mood, as well as some remarks on that part of the supplement to the Syntax which treats of propositions.

WOMAN 'S A RIDDLE.*

THERE are people who speak with thoughtless contempt of the ordinary novel-reader, and consider him a being for whom no fiction is too crude, no plot too absurd and unnatural. Yet there are moments when one is inclined to fancy that the students who read novels steadily, and read them all, must be the great unconscious poets of the human race. Nothing is a more certain mark of the poet than his power of bringing beauty and order to everything that he contemplates. He detects harmonies and contrasts, subtle tones and fleeting charms, invisible to the eyes of others. "I don't see that in Nature," some one said, who was watching Turner at his easel. "No, but don't you wish you did?" replied the painter. And just as Turner saw colours more glowing and shadows more evanescent than appear to ordinary mortals, the novel-reader must somehow out of his own abundance bring life to the most wooden characters, and consistency to the most incoherent plot. We wish we could see these things as he apparently sees them. This vision and faculty would make the reading of books like *Woman's a Riddle* a much less unpleasant task than it is at present. We might find ourselves interested in the characters, the first conception of which is not amiss; and in the plot, which has some elements of merit. In fact, we might be satisfied with those good intentions which the author, like Mr. Wilkins Micawber, has unfortunately failed to carry out in any one direction.

It was rather a happy notion to put the story of this book into the mouth of a governess and companion of the heroine's, a Miss Caroline Rudd. Miss Rudd describes herself as the Chorus of the tale, "whose business it is to make the actions of the personages of the story consequential," whatever she may mean by that. She certainly acts with energy on the Horatian maxim *consiliatur amice*, and she fills up every pause in the story with fluent moralizing and spurts of friendly advice. Her position is a peculiarly favourable one for dispassionate observation, and she is assisted by the extraordinary and inexplicable frankness with which all the characters confide to her their wishes and their secrets. She meets, at a house where she is governess, a certain Sir Gervase Warmstretey, a pompous and prosy old baronet. To see her is the same thing with Sir Gervase as to think that she would be the best possible guide and friend for his niece, and probable heiress, Katherine Ludlow, a young lady whose education has been absolutely neglected. As soon as he has engaged Miss Rudd, he lets her know that there is a blot on Katherine's birth, that she is the child of a *misalliance* on the part of his sister. Miss Ludlow is equally open. "I have low blood in me. My father wasn't a gentleman. He dropped his *k's*, and was very polite to his betters, which is a sure sign of low breeding." Next a Mrs. Carey, who wishes the baronet to marry her daughter, as good as confesses her designs to Miss Rudd the very first time she sees her. Their acquaintance has not advanced far before she tells her the tale of her daughter's previous engagement to a cousin, a Captain Tavenor, a man of the worst character. The daughter, who is described as a "tipping" and "nestling" creature, is equally gushing. She is scarcely married to the pompous Sir Gervase before she discusses with her companion the kind of heaven that may be expected to await her husband. It is to be "a paradise in those unexplored regions which lie around the North Pole. The several states of beatitude would be represented by various heights of icebergs." Yet Miss Rudd tells us nothing about herself to account for these unanimous bursts of confidence. She is not like Esther in *Black House*, who is always doing kind actions, and then wondering in a wearisome way why every one loves her so much. Miss Rudd never wonders, but takes all this respect and affection as her due. Yet, if we consider her merely as an instructor of youth, her language is the reverse of what might be wished. A governess might be expected to know that *du trop* is not French, and that to talk of the "Captain being round" is not a grammatical way of saying that the Captain paid a morning visit. These are only ordinary specimens of her slipshod style. Her moral qualities do not appear to have been attractive. There is something very spiteful in her account of the evil fates of the unpleasant children whom she was at first engaged to teach. And her own didactic language is as prosy and dreary as the baronet's, except when she snubs her pupil in this elegant way:—"Have done with your nonsense; you are like a sailor's parrot, only capable of speaking wicked words, or screaming nonsense." No wonder Katherine Ludlow said:—"You don't speak to me as I want to be spoken to."

It must be admitted, however, that Miss Ludlow was a very trying pupil. "There was something wonderfully beautiful in her eyes, untamed and composite as that expression was. In watching her sometimes Coleridge's strange line would come into my head, 'Woman waiting for her demon lover.' In her character, 'if there was much of coarseness, there was absolutely nothing of vulgarity.' This distinction does not seem to be based on any difference

* *Woman's a Riddle*; or, *Baby Warmstretey*. By Philip Sheldon. London: Henry S. King & Co. 1874.

in the case of Miss Ludlow, who calls the servants by such names as Swallow-tails, is on intimate terms with the housemaid, writes a letter in which she says that her uncle's wife is "high and mity," and generally behaves with incredible meanness and rudeness. The fact is that the author of *Woman's a Riddle* has failed in what looks like an attempt to copy the heroine of one of the most powerful and least pleasant of recent French novels. He has given Katherine Ludlow the dark "mesmeric" beauty, the passion, and the waywardness of Julia de Tréceur, but he has completely failed to draw a wicked woman who is a lady in spite of all her faults. It is true that he tries to show that Katherine's vulgarity was merely a form of perversity adopted to annoy her tediously polite uncle and guardian. But vulgarity is the essence of her nature, and she is even more offensive after Sir Gervase's death than she was when his prim formality provoked her impertinences.

When this young lady heard that her uncle was so disgusted by her many offences that he had determined to disinherit her and marry Miss Carey, her language was forcible and peculiar. "She said in a low voice, 'I wish God would strike my uncle dead.' 'And next,' she said, with striking intensity of articulation, 'I wish God would strike Miss Carey dead.'" It was clearly time that a girl who cherished sentiments of this kind should be separated from the people she disliked. So Katherine was sent to school, but no one could dream of parting with Miss Rudd, who remained at the Hall as companion to the wife of Sir Gervase. Miss Carey, now Lady Warmstreys, was greatly in need of what Becky Sharp calls a sheep-dog. Her angelic purity was such that she saw no harm in the most glaring and obvious improprieties. She is the favourite character of the author, who considers her very weakness amiable. But there is a difference between weakness and imbecility. No doubt there are women who are the more loved for their want of strength and need of protection. But Lady Warmstreys is represented as impossibly childish and feeble. Her home is most unhappy, for her husband is a martinet, who lives in obedience to the clock, and terrifies her with his demands that she should act energetically as mistress of his household. He has scarcely returned from his wedding tour when he forbids his wife's mother to enter the house, merely because she bores him as a mother-in-law. Lady Warmstreys pays secret visits to her mother's cottage, and there meets the cousin to whom she had been engaged. Her conduct at once becomes worse than silly. She says about her cousin:—

A face that we have not seen for a long time recalls those little poems which made the past melodious. My cousin has awakened the memory of one of those little songs in my heart, and its voice makes me cheerful.

It is in vain that Sir Gervase forces the mother to leave the neighbourhood, and forbids the cousin to enter his house. During her husband's absence in town, Lady Warmstreys takes solitary walks with Captain Tavenor, and enjoys a variety of little songs in her heart. Miss Rudd remonstrates, but is disarmed by her Ladyship's childlike innocence:—

"Do you think there is any harm in my seeing Philip in the same way as I saw my mother?"

"But your Ladyship doesn't place a cousin on the same level as your mother?"

"I wouldn't if I had mamma here. But next to her it pleases me to have Philip to talk to. You can't guess, Miss Rudd, how much we find to chat about. He remembers poor papa—you see his father was papa's brother—and was recalling just now some amusing traits in his character. He was also telling me what officers' wives do in India to pass the time; how dreadfully they flirt, and what a number of them run away from their husbands. Poor Philip, he certainly is very droll. He makes me laugh so that I am sometimes quite ashamed. He tells a story very beautifully; to listen to him is like reading a novel. I think him clever, Miss Rudd, don't you?"

So, in spite of her husband's commands, Lady Warmstreys went on passing the time in the same way as, according to Captain Tavenor, officers' wives used to do in India. It was plain to what Miss Rudd calls the "viewless eye of some Coming Event" that there must be an end sooner or later to this sort of thing. The pages in which we are told what that end was are by far the best in the novel. The situation is powerfully conceived, and worked out with unusual force, consistency, and feeling. If one situation could redeem a story, the description of the events which culminate in the death of Sir Gervase would give a tolerably high place to *Woman's a Riddle*.

Unfortunately, the writer falls into a more sluggish style after this effort, and Lady Warmstreys ceases to be touching, and returns to her normal silliness. She permits Captain Tavenor to join her mother and herself on the Continent, and when her mother dies she marries her cousin, and returns with him to England. At first her life seems to have every promise of happiness, but the real tragedy to which all that has gone before is only what Miss Rudd calls "a sketchy prelude" now begins. Captain Tavenor complains of the insults which Katherine Ludlow heaps upon him, and the author goes on with his coarse imitation (as it strikes us) of Julia de Tréceur. No one who has read that novel will be astonished when Katherine and the Captain elope together. But, as there is no hint of the growth of any passion between them, nor any token of that tragic fatality whose presence is felt through the whole of M. Fouillet's story, other readers may be a little surprised. Katherine was animated perhaps by her hatred of her uncle's widow, and her passion for revenge. But, as Miss Rudd herself remarks, "no theory of human wickedness that I could form seemed elastic enough to include the possibilities of such deliberate, naked, shocking duplicity as this man had been guilty of." That is exactly what we have to object to. No theory of human folly will account for the confusion in this

straggling and careless tale. It is not woman only that is a riddle in this book, but man, and even the solar system itself. Philosophers who think that the business of philosophy is to reconcile apparent contradictions will find some easy examples for beginners in *Woman's a Riddle*. How, for instance, did it happen that the moon, which in the evening was small-horned, delicate, and wan as a wreath of mist, by ten o'clock made the sky "luminous with white haze," and "sailed silvery and serene above the house"? How was it that Mrs. Carey came to ask a nephew whom she reprobated so strongly as she did Captain Tavenor to stay with her for a fortnight? How can Miss Rudd speak of "the furtive interest that is peculiar to me," and of her "decided aversion to seeking or finding excitement in interests that cannot by any known means be my concern." How could Sir Gervase be so anxious that his niece should be placid and lady-like, and at the same time wish his wife to "rate the maids for imaginary wrongs, and, in fine, develop or degenerate into something bustling, awkward, busy, and useless." Miss Rudd observes that Katherine Ludlow "would fib with happy dexterity, and maintain without flaw, by the aid of a memory singularly retentive and exact, the vraisemblance of her invention." It is a pity that the author of *Woman's a Riddle* has not the same happy dexterity. For lack of it, there is an entire want of *vraisemblance* in a story which, in spite of an unpleasant plot, might have been made powerful and interesting. As it is, the words of Mr. Tulliver, "Everything's a moodle," would make a better title to this book than *Woman's a Riddle*.

NEATE'S SPECIMENS OF COMPOSITION.*

THIS production of Mr. Neate is certainly not open to the imputation of being what the Greeks proverbially called *μυα κακόν*. But, though thus as far as possible from constituting a *μυα βέλιον*, its intrinsic merits are such that it cannot but rank much higher, in the opinion of competent judges, than many works of considerably greater bulk and noisier reputation. Mr. Neate introduces his little book to the public after this fashion:—

The following pages are intended chiefly as a preface or introduction to something which the author proposes to write on the important, and, as it soon will be, pressing question of the comparative value of ancient and modern languages as instruments for developing the faculties, and as means of imparting knowledge.

Mr. Neate adds that he ventures, as certainly without any presumption he may venture, to think that he is "entitled to speak as a witness on the comparative use of the French and Latin languages." Now, in looking upon this small volume as a preface or introduction to something else, we have only to say, So be it. Taking our own experience, however, as a guide, we have too great a reliance upon the instincts of human laziness to waste much faith upon this unexecuted promise—a promise to be fulfilled some time or other, in some shadowy division of the indefinite hereafter. Anything coming from Mr. Neate's pen will be cordially welcomed by us—as soon as it comes. In the meantime the preface or introduction to this unwritten work contains—first, specimens of Latin verse; secondly, specimens of Latin prose—a mastery over which such as Mr. Neate displays is, we need scarcely say, a much rarer accomplishment. Then we have passages of French prose, selected from a book published more than twenty years ago, in the shape of an imaginary dialogue between M. Guizot and Louis Blanc, "both of them being supposed, rather prematurely," as Mr. Neate remarks, "to be then politically dead." Finally, the author has added a specimen of his English writing, as "having some relation to the question of how far the Latin and French languages are conducive to the formation of an English style."

With these English specimens, as being, in our judgment, the least important and noteworthy subdivision of the work, we will begin. They do not, as far as we can see, throw any particular light upon the question which Mr. Neate by their help proposes to elucidate; and we should have much preferred to know what Mr. Neate could accomplish in the difficult art of French verse. The beauty of his Latin poems, taken in conjunction with his undoubted command over the French tongue, leads us to believe that any compositions of his in that kind would be well worth reading; but he gives us none. To return, therefore, to these English specimens. They are taken from a work published some years ago, advocating the abolition of capital punishment. Mr. Neate is never otherwise than a thoughtful writer, and thoroughly conscientious in the treatment of any subject that engages his attention. He has accordingly the merit of always originating what we read as his, and, if sometimes wrong, he is at least never commonplace. His arguments in support of his thesis appeal to us wire-drawn and over-refined. But then we belong to that thick-skinned class of philanthropists whose sympathies are reserved altogether for the maimed and murdered victims of the gentry on behalf of whom Mr. Neate is here holding a brief. We therefore leave the subject-matter of this essay to be weighed and valued by others, and only consider these specimens as what they here purport to be, specimens of English style. From this point of view we shall have little to say of them. The style is good enough; better than the average, one may fairly say, but still not exceptionally good; above all, we cannot discover a trace of

* *Specimens of Composition*. By Charles Neate, M.A., Fellow of Oriel College. Oxford and London: Parker & Co. 1874.

French inspiration from beginning to end. The sentences, if they had been composed as French sentences, would, we are sure, have been put through their paces with absolute neatness and precision. And is, some of them seem to straggle and sprawl a little. Moreover, they rather strike us as being, according to a common enough piece of slovenliness among English prose writers, somewhat *over-whipped*. However, in this we are perhaps too fastidious, some very great writers, including Macaulay, not being able to drive that pig-headed relative pronoun entirely to our satisfaction. We have therefore no wish to deny that the style upon the whole is good and the reasoning acute.

The Latin verses we shall take next in order; of them we can fairly say that they strike us as being of unusual merit. Mr. Neate has the power of varying his style; of giving us, when it is his cue to imitate Ovid, the slacker and more fluent versification of Ovid, whilst at other times the more massive periodical rhythms of Virgil and Lucan are reproduced with equal success. We quote six lines from some original verses in a poem on "the Heroism of Woman, a common story":—

Tallus exploras, Deus optime, pectora plagis
Femineæ, atque idem calesti lumine firmas.
Sollicit in duram suavis constantia sortem
His datur, atque animi virtus sine pulvere nostri;
Sit satis ergo viris muliculi corle supremum
Expectare diem, nec sponte lacessere fatum.

The speech of Moloch in *Paradise Lost* is very powerfully translated. We submit to our readers the end of it from the line—

What fear we then, what doubt we to incense
His utmost ire? . . .
Quid metuendum igitur, cur non extrema malorum
Sollicitare juvet? Sævis licet ultima tentet,
Aut nos in nihilum rediget Deus (unde Creatos
Jactat voce sua), quanto hoc præstantius esset
Quam nova perpetuis consumere secula penus—
Vel si etiam nobis virtus diviniore insit
Quæ non esse vetet, si qua asperiora supersint.
Hæc citra fines nihili consistere debent;
Æternumque licet, quod jam potius videmur,
Triatibus excubitis corrumpere gaudia cœli
Divinasque domos violare incuriosus, Ipse
Sit licet intactus, sed et Ipse dolebit, et postem
Fortiter ulcisci sua sit victoria victis.

But, as we have intimated above, Mr. Neate will find many more rivals as an imitator of Virgil and Ovid than as an adept in the diction of Cicero. The art of writing Latin prose, a very noble accomplishment, is not cultivated in this country as assiduously as it ought to be. Mr. Neate, however, is an honourable exception to this idleness and indifference on the part of our English scholars. In his dialogue between Cicero and Cleopatra—a dialogue suggested by the well-known expression "*Reginam odi*"—Mr. Neate has shown a dexterous scholarship and a power of dramatic representation possessed by few. The introduction in the style of one of Cicero's familiar epistles strikes us as being very like the original both in sentiment and style:—

Bene facis, me iudice, quod de me queris, quisnam fuerit ille meus cum Regina superbissimâ concursus, quem tam leviter et strictum scribendo attigerim. Amici enim est scire velle quod amicus aut dixerit aut fecerit aut passus sit, et posteris fortasse curæ erit audire, quousque et in ipsâ Româ et in virum consularum, ne plura de me dicam, illud tandem prorupit portentum Regiæ insolentia, &c. &c.

A comparison between Homer and the Nile belongs by right of prior occupation to De Quincey; but it is thrown into graceful and effective Latin; whilst Mr. Neate's manner of characterizing the art of Egypt seems to us excellent in point both of thought and of style:—

Interdum tamen contactu artis Egyptiacæ Sol ipse sit musicus, nec ullo Musarum comitante choro, solus autem et inivans, ut Deum decet, vasta locorum silentia lentâ divini cantus dulcedine perfundit. Incuriosum unum aliquid et *αἰσχροπρεπές* habet ars omnis nostra, quæ famæ et opinionis securâ, stabilitate suâ æternitatem sibi parit, nullisque mundi ætutibus non æqualis esse visa, fluxa humani gegeris secula, longasque, ut sibi videntur, spes hominum brevitatis simul et vanitatis arguit.

Cleopatra, moreover, not content with silencing Cicero, quotes, or at least all but quotes, Virgil—a great literary feat to be performed in the lifetime of Julius Cæsar. We have long known, of course, that Bacon wrote all the plays of Shakespeare; are we to learn further, in our old age, that the true author of the *Æneid* was Cleopatra? If Virgil had, by any accident, overheard the conversation here recorded, the line in the *Métromane*—"Ce sont des vols qu'ils nous ont faits d'avance"—would undoubtedly have come into his mind.

What we have said of Mr. Neate's Latin prose we must repeat, with even stronger emphasis, of his French dialogues. For men who might write Latin verses on good terms with Mr. Neate we should be fortunate in finding one to equal his imitations of Cicero and Seneca; but even the rare acquirement of writing excellent Latin prose is common and almost vulgar compared with a thorough knowledge of, and mastery over, French. Most of us possess a certain slovenly familiarity with that admirable language; but an Englishman who can write a French essay as if he were an educated Frenchman is almost harder to find than the honest man of Diogenes. Mr. Neate, however, has succeeded in his most arduous task. His political dialogues between Louis Blanc and Guizot gained the admiration of the distinguished interlocutors themselves. They both sought Mr. Neate's acquaintance, being struck by the fairness, eloquence, and mimetic power with which he had drawn their intellectual likenesses. Other eminent men also have followed that example, and have often expressed the

high esteem in which they hold this remarkable—we believe we might add, this unique—production. The French of these dialogues is excellent; but, even supposing that a keen critic from the Academy were to tell us that a certain turn of words here, a certain epithet there, betrayed the foreign origin of the work, we should fall back in full confidence upon the solidity of the thoughts, and upon the spirit, grace, and energy of the diction. We give one extract from the supposed Louis Blanc, and another from the supposed M. Guizot, and thus conclude, heartily recommending this little book to our readers. The first passage is put into the mouth of M. Guizot, and is meant to prove how nature herself eternally battles that envious longing after equality so deeply implanted at present in the French mind:—

Et si après tout l'inégalité des conditions vous répugne par son caractère fortuit, et parce qu'elle ne répond souvent à aucune différence de capacité ou de mérite, dites-moi un peu, la gloire que vous aimez tant et dont vous faites sonner le nom si haut, qu'est-elle sinon souvent la plus injuste, et toujours la plus grande des inégalités? Et la mort, cette roue dont vous ne pouvez briser le sceptre, dont vous cherchez plutôt à vous faire les ministres et les courtisans, quelle inégalité plus extrême, et, s'il est permis de le dire, plus intolérable que la siennne? Nivelez tant que vous voudrez les conditions de la vie, faites asseoir le pauvre à la table du riche, ou, ce qui vous sera plus facile, faites coucher le riche sur le grabat du pauvre, vous aurez peu fait pour égaliser les destinées des hommes, tant que vous n'aurez pas empêché la vieillesse et le vice de fouler la tombe de la jeunesse et la beauté.

We have not room to quote the whole of M. Louis Blanc's views about property, illustrated by a description of the Athenians, to show how slavery had its uses once, as property has now, and how to that slavery the Athenians were indebted for much of their civilization:—

Si nous voulons apprécier cette civilisation au point de vue moderne, c'est à cela, c'est à dire à l'esclavage, qu'il faut surtout attribuer ou imputer ces habitudes de grand seigneur, ces vices de bonne compagnie, cette insolence tempérée par la bonne humeur, cette faute assaisonnée par le bon goût, cette candeur dans la corruption, cette grâce dans la crapule, qui faisaient des Athéniens un peuple tout à fait comme il faut, un peuple Louis Quinze.

The value at which intellectual exercises of this kind are estimated will, of course, differ among different men; but every one, we think, must admit that those of Mr. Neate's are excellent of the kind.

GERMAN LITERATURE.

AT the very hour when thanksgivings for the happy attainment of the millennial anniversary of the old Norse colony were being offered in the churches of Iceland, Herr Konrad Maurer* dated the preface to a volume designed to serve as a permanent memorial of that striking celebration, from which the introduction of constitutional government will also be dated. The work is worthy of the occasion, and of the thirty years of research on which it is based. A dozen volumes, says the author, would have been needed to enable him to tell all he knows; but he has judiciously contented himself with condensing the most essential particulars into one. The history of Iceland is doubly interesting; first, from its romantic character, which has perhaps already received sufficient justice at the hands of historians; secondly, as an instance, during at least a considerable part of its course, of the development of a people in almost total seclusion from external influences. The chief exception is the introduction of Christianity into the country, which was undoubtedly a serious interruption of the national traditions. The most zealous Christian might find a difficulty in repressing the wish that the Icelanders had been left undisturbed for a thousand years, in order that it might be seen what form the Odin faith would have eventually assumed among a people of so much natural intelligence. Still, even as matters stood, the triumph of the new creed was in the main the work of native conviction; the Icelanders were neither enlightened and overmastered by the superior civilization of foreign instructors, nor coerced into conformity by such rough missionaries as Charlemagne. The evolution of political and legal institutions, however, is strictly indigenous, and furnishes a most interesting example of the national genius for organization. It forms the leading subject of Herr Maurer's work. He traces the germ of the Icelandic constitution to the sense of religious obligation which led the chiefs of the early immigrants to erect and endow temples. These gradually became the nuclei of communities, and as the need for a bond of union made itself felt, the conception of the religious congregation, and the authority of its head, were gradually extended to secular affairs. The administrative system thus gradually originated, the body of jurisprudence which grew out of it, the magistracy, the popular assemblies, the care of the poor, the modifications arising from the introduction of Christianity, the decay of national independence and the subjugation by Norway, are all made the subjects of minute but by no means tedious investigation. Interesting chapters are added on Icelandic literature, and on the industry and commerce of the island during its period of self-government. The entire absence of pretension serves to enhance our sense of the solid merit of the book.

The second part of the first volume of Fontane's history of the Franco-German war† brings the narrative down to the capitulation of Metz. Like the former part, it is full of matter, but rather adapted for reference than perusal. Heyde and Froese's history of

* *Inland von seiner ersten Entdeckung bis zum Untergange des Freistaats. Von Konrad Maurer. München: Kaiser. London: Asher & Co.*

† *Der Krieg gegen Frankreich, 1870-71. Von T. Fontane. Bd. 2. Hbd. 2. Berlin: Decker. London: Williams & Norgate.*

the investment of Paris* is a valuable work from the point of view of the military engineer, for whom alone it is designed.

Signor Massari† is a leading member of the Conservative section of the Italian Parliament; he was intimately acquainted with Cavour, and has every qualification for writing his life except a decided call to biographical composition. The absence of this renders his work somewhat tame; it is nevertheless enlivened by a good deal of personal anecdote, and will be found useful as a condensed account of the public life of the great Italian statesman. Signor Massari's work offends neither by shapelessness nor prolixity.

A just perception of the degree in which these faults deform the majority of modern biographies has mainly suggested Rudolf Gottschall's‡ project for the publication of a biographical series which is to be distinguished above all things by symmetry and conciseness. The idea is excellent, and the execution promises to be meritorious. The first volume contains four lives of notable personages by eminent writers—that of Luther, by H. Rückert; of Cromwell, by Reinhold Pauli; of Henry IV. of France, by M. Philippson; of Voltaire, by Rosenkranz. The choice of subjects, it will be seen, is mainly determined by the present circumstances of Germany; all bear directly or indirectly upon the national contest with Rome. The treatment of each subject is correspondingly influenced; Cromwell, for example, being regarded less from the English point of view than in the relation of his policy to Continental affairs. This, however, can hardly be censured under the circumstances, while the literary execution of the respective biographies fully justifies the professions of the prospectus.

Otto von Guericke§, burgomaster of the city of Magdeburg in the seventeenth century, was a man of versatile abilities, eminent in the conduct of local business, but chiefly distinguished as an inventor and experimenter in physical science. After the sack of his native city by Tilly, at which he was present, he entered the Swedish service, and was subsequently concerned in the unsuccessful negotiations through which Magdeburg sought to attain the rank of a free city of the Empire. In his latter years he produced a work in defence of the existence of a vacuum, and a history of Magdeburg, two-thirds of which are lost. His biographer claims for him the merit of having made the first step towards the construction of an electrical machine.

An account of the conclave which resulted in the election of Pope Innocent XIII.¶ (1721) is an interesting addition to the journals of the Conclavists. It is less fertile in scandals than the majority of such documents, party spirit not having run very high on this occasion, and intrigue being less busy than usual. The choice ultimately arrived at was unanimous, and encountered the utmost reluctance, real or affected, in the Cardinal upon whom it fell. The most dramatic incident of the proceedings was the appearance, under a safe-conduct, of Cardinal Alberoni, then an exile from Spain and persecuted by the late Pope. The narrative is translated from the Italian, and is couched in the conventional form of a letter to a friend. The translator has added a version of a MS. circulated before the Conclave, and treating of the prospects of the members of the Sacred College, or rather of the seniors among them; it being taken for granted that, the Holy Spirit notwithstanding, no one under sixty would have any chance. A warning of Pasquin is quoted, which has since been strikingly verified:—

Pietro, se dai le chiavi a Gesù,
Non sperar che te le renda più.

A biography of Uhland¶¶ by his widow is a valuable addition to the lives of the German poets. Like its subject, it is distinguished by simplicity and good taste. Uhland's life was not eventful, and nearly all the productive portion of it was comprised within a few years. During this period he was young and obscure; upon his attaining fame the source of inspiration dried up, and neither his tastes nor his social relations were such as to make him a potentate in the literary world. From purely patriotic motives he turned his attention to politics, and the vexations connected with an independent career at a period of severity and absolutism proved sufficient to extinguish any chance of his again finding utterance as a poet. He had, however, the consolation of attaining a high character for manly patriotism and incorruptible disinterestedness. The same national feeling which had led him to enter public life induced him to give great attention to the study of antique German poetry, to which his latter years were mainly devoted. This volume contains a considerable amount of interesting correspondence, and is altogether a worthy record of an admirable poet and exemplary citizen, too limited in his genius and sympathies to have largely influenced the literary history of his country, but occupying in it his own peculiar niche with such completeness as to have left no place for a rival or successor.

Porson's epigram on Hermann*, though itself but a plagiarism from the Greek Anthology, has made the name of his rival familiar to many who, though no philologists, will still be glad to know what manner of man this particular German was. Professor Köchly's biography enables us to define him as a philologist of the old school—a bookworm if you looked merely to the narrow range of his professional pursuits and his exclusive devotion to them, a man of the world in force of character and strength of understanding. Among his chief characteristics were acuteness, simplicity, honesty, and a sturdy love of truth. The latter he especially showed in the weight he accorded to the objections against the Wolfian hypothesis of the origin of the Homeric poems, of which he was nevertheless a decided partisan. His life was wholly uneventful, and entirely engrossed by philological and academic interests. One of his duties as Professor at Leipsic, it is astonishing to hear, was that of censor of *belles-lettres*, in which capacity he had to read all the novels and poems published at that enormous book-mart. He was a still greater exception to the ordinary pursuits of German professorship in his fondness for equestrian exercise. The simplicity of Professor Köchly's biography is fully in keeping with the subject. It is clear, concise, methodical, all digressions and illustrations being banished to the notes, which constitute a varied and entertaining appendix. Among other interesting particulars, the writer gives an account of academical education in Saxony in his own younger days, and seems inclined to doubt whether the system has been improved as a whole. He admits, however, that mathematics and modern languages were neglected. The volume is adorned by a splendid portrait of Hermann, and contains reprints of some of his minor writings, such as official discourses and copies of Latin verse.

The publication of the minor works of another illustrious scholar is at length complete. The fourth volume of August Boeckh's‡ academical dissertations at Berlin, being the seventh and concluding volume of his smaller writings, contains no less than sixty-six Latin disquisitions, almost exclusively on minute points of Hellenic philology or archaeology. The most important perhaps are those on the reputed, but, as Boeckh thinks, imaginary, enmity of Plato and Xenophon, and on the date of Plato's "Republic." They also include numerous illustrations of the Attic dramatists and orators, with a few academical addresses.

A treatise on Logic, by H. Lotze†, is designed as a prelude to a new system of metaphysical philosophy. Its scope is accordingly more extensive than that of a merely technical treatise on the subject.

The history of War to the death of Alexander the Great§ is substantially the military history of Greece, our information respecting the organization and campaigns of other ancient nations up to that date being very imperfect. Prince Galitzin, however, has appended a sketch of the Roman and Carthaginian military systems on the eve of the appearance of these States as first-class Powers. The work, though formidable in extent and somewhat heavy in style, is nevertheless highly instructive, and interesting as an example of the application of criticism grounded on the principles of modern tactics to the accounts of the ancient historians.

With the publication of a volume on the Upper Jura, Dr. Brauns¶ concludes his work on the geology and paleontology of the German portion of that range. From the geological period of the deposits, the book is necessarily in the main a contribution to fossil conchology.

Ernst Haeckel's long expected "Anthropogeny, or History of Human Development,"¶ is undoubtedly in some respects a great work. The leading conception of the human embryo as the miniature representation of the entire series of the development of life from the lowest to the highest animal organisms is lucidly expressed, vigorously enforced, and illustrated with a vast display of anatomical knowledge. The numerous defects of the work are perhaps reducible to the cardinal one of the author's character as a mere specialist, with no just appreciation of the problems which beset biological inquiry save in his own particular department of comparative anatomy. He has made out to his own satisfaction the anatomical links of affinity between the ascidian and the human race, and he seems to think nothing further necessary to justify the direct affiliation of the latter to the former. He does not consider that the gradation of forms is equally explicable on the hypothesis of an external agency working according to a preconceived plan, or of a plastic force immanent in all existence, and that if these, as must be conceded, are but precarious inferences from imperfectly understood phenomena, the capacity of anything to metamorphose itself into another thing is, until the transition has been actually observed, just such another questionable corollary. He would probably contend that Mr. Darwin's generalization has placed the matter on a different

footing; but it is the misfortune of his book that he is compelled to refer habitually to the Darwinian theory as an established truth, without having space, or, as we suspect, inclination, to combat the numerous scruples which must present themselves to those who are even slightly acquainted with the literature of the subject. Assuming, as he needs must, a practically infinite period of geological time, he ignores the arguments by which natural philosophers, better authorities on such a point than natural historians, have endeavoured to demonstrate the physical impossibility of the proposition. He does not remark that all the incontestable evidence we possess of the agency of natural selection in the production of species tends at the same time to show that the scope of this agency is restricted; that the birds of oceanic islands, however modified from the parent type, are still birds; that the clear proof of the derivation of the North Asiatic and North American trees from the same stock fails to connect either with the lichen and the palm. He treats the organic character of the *Trozon* as indisputable, though the controversy is notoriously in suspense. On the whole, the author's attainments fall short of the encyclopedic character which could alone have justified the extreme confidence and dogmatism of his language. As a contribution to a special branch of a vast investigation, his work is no doubt very valuable, and will probably tend to strengthen two growing convictions, that evolution actually is the key to the mystery of Nature, and that the secret of its application has as yet set human ingenuity at defiance.

E. Förstemann's history of the Teutonic family of languages* is divided into three sections—the first treating of the primitive Aryan language from which it took its rise; the second of the transition period previous to its definitive separation from the Slavonic branch of the family; the last of the language in its first recognisable Germanic form. The work is manifestly one of great research, and the author is a sound philologist, a pupil of Pott and Grimm. In his preface he speaks reprovingly of the speculative license indulged in since the death of the founders of comparative philology.

M. Hettema's dictionary of the Frisian language† is principally extracted from old literary monuments, especially collections of laws. The resemblance of Frisian to our own language renders the work one of importance for English philology.

Dr. Koerting's essay on the literary history of *Diety's Grotensis* and *Dares Phrygius*‡ is chiefly directed to the refutation of the now generally accepted theory that the Latin text of *Diety's*, the only form in which the book is at present extant, professedly a translation from the Greek, is in fact the original.

Dr. E. Schrader § follows up his valuable researches in Assyrian science by the publication of a German version of the Deluge tablet discovered and interpreted by Mr. George Smith, with a philological commentary, and some interesting and judicious observations on the character and probable date of the composition. Dr. Schrader is not only an ingenious but a sound and wary scholar, averse to all rash theories, and content to defer to the authorities who have made the Assyrian inscriptions, for years so unaccountably neglected in Germany, their study for a longer period than he has done. The hymns and metrical charms published in the second part of his volume have for the most part been already translated by Mr. Fox Talbot and others; it is his merit to have made them accessible to a wider public, and to have contributed to the elucidation of doubtful points. Their resemblance to the Hebrew Psalms, alike in form and spirit, must strike all readers.

The great advantage of Wessely's *Christian Iconography* || over former works of the same description is that, whereas the latter have merely indicated the symbols or attributes of saints or other personages represented in sacred art, Wessely's work adds the information where these delineations may be found, whether in paintings or engravings. The work is also far more copious than its predecessors; the author, however, modestly disclaims all idea of having exhausted his subject.

We have to record the completion, on a scale answerable to the magnificence of the beginning, of MM. Havard and Madou's admirable pictorial and literary illustrations of the architecture, costumes, and social life of the last four centuries¶, the commencement of which has been previously noticed by us. Another enterprising publication of M. Havard's is his collection of beautiful examples of domestic art, selected from the principal museums of Holland**, a book most beautifully executed, and of great interest to artists and amateurs.

It is remarkable that the editor of the "German Survey"††

should be able to describe his periodical as the first ever professedly devoted to the national culture as a whole, instead of to some special department. If this is really the case, it is high time that the deficiency should be supplied, and it is extremely satisfactory to find it promising to be supplied so well. Auerbach and T. Storni have contributed novelettes, the latter a work of real power. A narrative of the march of the German army upon Sedan is full of interest; and Professor von Sybel has written an account of the first partition of Poland, accurate in substance, but apologetic in tone. For this great political crime, as well as for all the other sins and follies of Germany, the Pope is made indirectly responsible. The most pleasing article of any is one embodying anecdotes and letters of the great painter Kaulbach, highly characteristic of his unaffected and independent character. Foreign disciples of Wagner will be interested by an account of the recent performance of *Tristan and Isolde* at Weimar. On the whole, the new periodical has made an excellent beginning, and only needs to be continued with equal ability to achieve a decided success. The weakest point of the present number is a tendency to indiscriminate panegyric in the literary notices, bearing a suspicious resemblance to *canon-radic*.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

ADVERTISEMENTS.

ST. JAMES'S THEATRE, King Street, Pall Mall, entirely redecorated, from Designs by J. T. Robinson, Architect, will RE-OPEN on SATURDAY next, October 25, with A GUARDIAN ANGEL, Comedietta by John Owenford and Joseph Hutton; and a new Comedy-Bouffe, in three acts, the Music by Charles Lecocq, the Libretto by H. B. Farnie, entitled THE BLACK PRINCE, supported by Mesdames Selma Dolore, Nelly Ironside, Emily Duncan, Louise Howard, Desse Hollingshead, Inez d'Aquilar, Linda Verner, Mamma John L. Hall, John Rouse, C. W. Norton, J. Layton, H. Clifford, and Mr. Chatterton, with full Chorus and Ballet, and specially selected Orchestra, conducted by Herr Schoening. New Scenery by Gieve. New Costumes by Madame L'Jee, Madame White, Gask and Gask, Poole, Skinner of Jermyn Street, Auguste et Cie, and May New Properties by Labhart and Henry Castle & Sons. A new Ball Entrance, a new Smokey Saloon, and a new Smoking Conservatory have been constructed. Box Office open from Ten to Five. Seats may also be looked at all Libraries and by letter. Private Boxes, 22 to 24, Stalls, 7s. 6d., 1st Dress Circle, 5s. 6d., 2nd Family Circle, 3s. 6d., 1st Amphitheatre, 1s.

DORE'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "The Dream of Pilate's Wife," "Night of the Crucifixion," "Christ's Martyr," "Francisca da Rimini," "Andromeda," &c., at the DORE GALLERY, 30 New Bond Street. Ten to Six.—Admission, 2s.

HYDE PARK COLLEGE FOR LADIES, 116 Gloucester

Termo, Hyde Park.

The SENIOR TERM begins November 2.

The JUNIOR HALF-TERM November 2.

Prospectuses, containing Terms, Names of Professors, &c., may be had on application to the Lady-Bursar.

MALVERN COLLEGE.

This College contains two Departments—the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head-Master and others of his Staff; a Gymnasium, &c.

Board and Tuition under Fourteen, £80; over Fourteen, £90. Non-Shareholders pay an extra Fee of £5.

Special advantages for Sons of Clergymen and Home Boarders.

For further information, apply to the Rev. ARTHUR FADEN, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 22 and 23.

MALVERN COLLEGE.

The ANNUAL EXAMINATION for SCHOLARSHIPS and EXHIBITIONS will be held on December 22 and 23. There will be awarded six House Scholarships of £50.

Four Founders' Scholarships of £20, and some Exhibitions of £30. The Awards will be for one, or for two years, according to merit, in Classics or Mathematics. For particulars apply to the HEAD-MASTER.

ELIZABETH COLLEGE, GUERNSEY.

Foster—The BISHOP of WINCHESTER.

Valuable University Scholarships and College Exhibitions, for annual competition.

Special attention paid to Modern Languages and the Preparation of Candidates for Woolwich, Queen's Hill, Control Department, Army and Navy, and Civil Service.

ARMY, WOOLWICH, COOPER'S HILL, MORGAN

JENKINS, M.A. (Worcester), assisted by an able staff of Graduates in First class Honours (including Second in First Class of Nat. Sci. Tripos), prepares Bachelors in Arts and NON-RESIDENT PUPILS for the above. Four out of Six sent up for Cooper's Hill the only Pupil for Woolwich, and Three out of Four for the last Latin Examination have passed.

Address, 30 Cornhill Road, Westbourne Park.

FOLKESTONE.—Mr. W. J. JEFFERSON, M.A. Oxon.

(formerly Principal of the Elphinstone High School, Bombay), with the assistance of a Cambridge Honour-Man, prepares PUPILS for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations. Terms and Fees on application.

STANFIELD HOUSE, Green Hill, Hampstead.—Mr. T. M.

JACOBIN, A.C.T., assisted by eminent Masters, receives into his house a very select number of PUPILS to Educate or to Prepare for the Public Schools, into nearly all of which Boys have been passed by him to high forms. The House and Grounds are spacious and healthily situated near the Heath. Highest references can be obtained from the Nobility and Clergy whose Sons Mr. JACOBIN has educated. Further particulars on application.

PRIVATE TUITION FOR ARMY, COOPER'S HILL, CIVIL

SERVICE, WOOLWICH, and UNIVERSITY.—Rev. Dr. HUGHES (Worcester) who has passed over 300, has VACANCIES. Also quite distinct young boys.—Loring, W.

DELICATE or BACKWARD BOYS.—A GRADUATE of

Trin. Coll., Cam., Married, an old Englishman, will have a VACANCY for ONE PUPIL, the middle of the present month. He offers Classics, Mathematics, French and thorough German, and every other kind of instruction for Delicate boys, and, if desired, Hunting, Shooting, and Fishing. Terms, £50 to £60 Guinea.—Address, Rev. R. H. L., Holgate Rectory, Much Wenlock.

TO PARENTS seeking the HIGHEST-CLASS EDUCATION

for their DAUGHTERS.—A GENTLEMAN, a scholar, at the Crystal Palace, offers a very superior House for 10 or 12 or 14 or 16 or 18 or 20 or 22 or 24 or 26 or 28 or 30 or 32 or 34 or 36 or 38 or 40 or 42 or 44 or 46 or 48 or 50 or 52 or 54 or 56 or 58 or 60 or 62 or 64 or 66 or 68 or 70 or 72 or 74 or 76 or 78 or 80 or 82 or 84 or 86 or 88 or 90 or 92 or 94 or 96 or 98 or 100 or 102 or 104 or 106 or 108 or 110 or 112 or 114 or 116 or 118 or 120 or 122 or 124 or 126 or 128 or 130 or 132 or 134 or 136 or 138 or 140 or 142 or 144 or 146 or 148 or 150 or 152 or 154 or 156 or 158 or 160 or 162 or 164 or 166 or 168 or 170 or 172 or 174 or 176 or 178 or 180 or 182 or 184 or 186 or 188 or 190 or 192 or 194 or 196 or 198 or 200 or 202 or 204 or 206 or 208 or 210 or 212 or 214 or 216 or 218 or 220 or THE PRINCE OF WALES IN FRANCE.

THE PRINCE OF WALES has been paying visits in France to one or two great Legitimist noblemen, and not even French journalists, who have no great objection to a little gossip, who can see the bad side of things readily enough, when duty calls on them to look through a millstone, and who know the value of scandal in the dead season, have ventured to hint that politics lie at the bottom of the Royal visit. The Duke of ROCHEFOUCAULD-BISACCIA is a Legitimist of the purest type, and was lately Ambassador in England, where he made himself agreeable and represented his country in a princely way. He was so great a man that he could ask the PRINCE OF WALES to come to stay with him in France and see how partridges are shot in a country where they are certainly cheaper, and therefore, we may suppose, more plentiful, than in England. The promised visit has been paid, and the PRINCE now knows whether shooting partridges is among the things that are better managed in France. Perhaps Frenchmen with all their love of equality may have some secret satisfaction in the thought that there are still to be found in France noblemen who have enough partridges, on estates sufficiently large, to enable them to offer an adequate kind of hospitality to the heir of the English Crown. Whenever Royal visits are now the topic of the day, it is scarcely possible that our old friend the SHAH should not in some way intrude himself into our memories; and there is a legend about that shining person that he was so struck with all he saw at Trentham, and so impressed with the dangers to Royalty which the existence of the owner of such a palace must cause, that he suggested to the future King of England the expediency of cutting off in time the head of a subject too great to be borne near the Throne. The beauty of the SHAH was that one story about him was just as good and as likely to be true as another; and at any rate, if not true, there could be nothing more pleasantly Mahometan and Oriental than a legend in which this mode of regarding the Duke of SUTHERLAND was depicted. The feeling, concealed perhaps by our habitual insular pride, but still the genuine feeling of most Britons who heard the story, was that of a legitimate satisfaction that we possessed and took as a matter of course the possession of noblemen whose grandeur would have been very soon ended in Persia by the bowstring. In every society man resembles his fellow-man, and it is difficult to suppose that the hearts of Frenchmen do not sometimes beat in unison with those emotions which set our organs palpitating so deliciously. If the cynical critics of Paris could have even made-believe to believe that the PRINCE'S visit had a political object, their patriotic indignation would have overcome every other consideration. But, as even people who might be supposed to accept as authentic the conversations between M. THIBES and the brigands could not be imagined capable of thinking that the PRINCE OF WALES went to France in order to gild the hopes of the Count of CHAMBORD, the arbiters of French opinion were left in a neutral and composed state of mind. To people in such a frame of thought the perception that France too could show noblemen whom the SHAH would have thought it prudent to exorcise was, we may venture to guess, not without a secret sweetness of its own.

Although, however, the visit of the PRINCE to France has no political significance whatever, he showed a dignified prudence in not absolutely confining his civilities to the representatives of one political party. Before he went to

kill partridges with his Legitimist friends he exchanged visits of politeness with Marshal MACMAHON, and he has subsequently accepted the hospitality of the great pride and mainstay of the Orleanists—the Duke of AUMALE. In all the little acts of Royal life discretion and tact are needed. Circumstances might easily be conceived in which it would have been very much out of place that the PRINCE OF WALES should go to stay with a Legitimist Duke. It is quite true that the PRINCE cannot commit England. Whether the PRINCE chooses to shoot partridges in one place or in another, the House of Commons, and through the House of Commons the constituencies, must determine the foreign policy of England; and if there is one thing certain in English politics, it is that ordinary English people have no sympathy whatever with a set of foreigners who propose to govern a great nation in the name of Divine right, and who are certainly the allies, and possibly the tools, of Ultramontanism. Had it been supposed that the PRINCE, by going to visit a conspicuous Legitimist partisan, meant to associate England with the intrigues of those who wish to put HENRY V. on the throne of France, there would have been a howl of mortification, and disappointment from one end of the country to the other. No objection can possibly be made to English Royalty paying visits of ceremony to the representatives of any foreign country, whoever they may be. If the PRINCE had gone to stay with Marshal MACMAHON there would have been nothing in the visit except a mark of attention to the actual representative of France. But to stay with the representative of a particular party in a foreign country is only defensible when the circumstances happen to be such that the visit has in point of fact no political significance. No one could possibly say that it would be right at the present moment that the PRINCE OF WALES should pay a friendly visit to the brother of Count ARNIM. The PRINCE cannot dissociate himself from England. He would not in any case make the foreign policy of England different from what it would be if he stayed at home. We should, in fact, disavow the PRINCE OF WALES if he gave it to be supposed that he was furthering the plans of any foreign party adverse to those of an existing Government. But it would be a great misfortune that we should have to wash our dirty linen in the eyes of Europe, and disavow the representative character of the heir of the Crown. It is all a question of time, of discretion, of good sense, of tact, whether the visit of the PRINCE to a nobleman conspicuous in the ranks of a foreign party is defensible or not. The PRINCE may be quite trusted to know when to pay such a visit and when not. Under a different set of circumstances, for the PRINCE to have visited the Duke of ROCHEFOUCAULD-BISACCIA might have been a political mistake. Under existing circumstances it was a natural and harmless mode of getting amusement and giving pleasure.

Why is this? The DUKE is not only a Legitimist. He is a Legitimist who was lately Ambassador in London, and who was dismissed from his high office because he suddenly left London, appeared in the Assembly, and there uttered a Legitimist manifesto in flagrant contradiction to the views of the Government he was serving. To honour such a man by a Royal visit within a few months, it may almost be said weeks, after he thus defied the ruling authorities of the country he represented in England, might have seemed a sign of encouragement to one French party as against another. Why does no one think that the visit of the PRINCE has any political meaning? The answer is very simple, and it is one which French Legitimists may

profit by considering. The reason why it does no harm to be civil to the Legitimists is that they are not important enough to make it of any moment whether they are encouraged or not. They are mere nullities. They are out of the running. They are only gentlemanly isolated people with whom France declines to have anything to do. They every now and then start a candidate—just as the dandy in one of Miss BURNLEY'S novels said that he went to the theatre—to show that they are alive. But that is all. No one wants them, or believes in them, or admires them. A year ago they were busy active people with hopes and plots, and with a fair prospect of success to enliven them. Their castle in the sand was washed away and the tide of indifference sweeps over the ruins of the Fusion. They are relegated to the shooting of partridges, and the destruction of those innocent birds cannot now be made the cloak for combinations designed to upset the tranquillity of France. Perhaps Legitimist Dukes are as well satisfied as any one else that things are as they are. Just as their beloved Prince was supposed to be loth at the critical moment to quit the familiar tranquillity and safety of exile and to rush on the perilous grandeur of Royalty, so they may be not so very sorry to be left to lead a life of peaceful and dignified luxury without the weariness of having to uphold a Court detested by the majority of their countrymen. They have really done all they could, and have earned their ease. They have worked their very hardest for their august master. They have insisted in season and out of season that he alone could save France. They have voted this way and that in obedience to the mysterious dictates of his Royal pleasure. They have quarrelled with every one for his sake. They have some of them even gone pilgrimages in the general furtherance of his interests. They have done all they could think of, or that he could suggest to them, that seemed calculated to make France believe that they and their friends were the truly national party, that the people were with them, and that three-halppence was the right change for a shilling. They have failed, but they have honestly deserved to enjoy all that can mitigate failure—local grandeur, the luxury of discontent, the interchange of confidential bitterness, excellent shooting, and even visits from English Royalty.

THE GOVERNMENT OF LONDON.

ALTHOUGH it is impossible that a Bill for establishing a municipal government in London should be carried by a private member, the promoters act in conformity with precedent in inducing Lord ELCHO to take charge of the measure in the first instance. If the Government determines on effecting the proposed change, it will probably meet with little opposition except on the part of the City of London. Legislation is never so facile as when it coincides with the current of commonplace opinion. To those who have never thought on the question, as well as to some who have more or less fully considered it, the apparent paradox of leaving the greatest of all civic communities without a municipal government may perhaps seem a conclusive argument against the continuance of the present system. The reasons in favour of corporate organization are so plausible that it is scarcely worth while to rely on fallacies and errors of fact. Mr. BEAL, who has for several years taken an active part in the movement, lately complained in a letter to the *Times* that the proposal of the Metropolitan Board to deal with the question of London gas supply is beyond its statutory powers. If the Board had statutory power to supply gas, it would scarcely ask Parliament to pass an empowering statute for the purpose. The same disability extends to all existing Corporations in places where, as in London, the statutory power to supply gas is vested in one or more Companies. Mr. BEAL further states that, while "Bills affecting the metropolis are in every Session presented to Parliament, no municipal authority is authorized to appear in the interest of the ratepayers, the Metropolitan Board having only specific powers to deal with certain questions." Mr. BEAL is apparently not aware that, under the Standing Orders of Parliament, the Metropolitan Board is allowed a *locus standi* on every Bill affecting the district under its jurisdiction. Probably few inhabitants of London know more about the existing civic administration than Mr. BEAL; and Mr. BEAL seems to know very little. The

statement that "the mutual antagonism of the Metropolitan Board and the City Corporation is most costly to the ratepayers" requires proof which it would perhaps be difficult to supply. The representatives of the City sometimes differ from their colleagues at the Board, but their antagonism costs nothing to the ratepayers. In the proposed Municipal Council or Board there may perhaps not always be perfect unanimity.

The evils which it is proposed to remedy become less alarming when they are enumerated in detail. A common impression prevails that the traffic of the streets would be less frequently interrupted if the management of the water, the gas, and the sewers were vested in the same hands. The alleged inconvenience has frequently been urged before Parliamentary Committees as an argument for the transfer of powers from Companies to Corporations; but on fuller investigation the supposed mischief generally collapses or disappears. As long as gas and water pipes and sewers are constructed in the present manner each kind of work must be separately repaired as defects are discovered. The construction of subways or large tunnels under the streets would render the disturbances of the surface unnecessary; but it is highly improbable that a Metropolitan Corporation would enter on so costly an undertaking. The second annoyance which troubles the minds of Londoners is that different rates are collected at different times by separate officers. There would be perhaps a saving of trouble, though not of expense, if all rates were paid together to a single collector. The occasional disturbance of the pavement, and the division of rates into dribbles, will be found on reflection to exhaust the grievances of the metropolis. If the gas works and water works were to pass into the possession of the present Board of Works and the Corporation of the City, or of a future municipality, the consumers would never be conscious of the change. The Government would incur grave and merited censure if it consented at any time to transfer to a municipal body the control of the metropolitan police. A disciplined force of eight thousand men, forming at the same time the reserve of the police of the kingdom, cannot safely be at the disposal of any authority but the Government. In other districts, and in London itself, the local organization of the police seriously diminishes its efficiency. The inability of a policeman to interfere with crime committed a short distance beyond the border of a county or borough is a greater evil than any result of the want of municipal government in London.

It is well that the institution of a great and perhaps a hazardous experiment will be vigilantly watched by a jealous and powerful body. The Corporation of the City of London will not surrender its cherished privileges without a resolute struggle. It may possibly be for the public interest that the opposition of the City should be overruled by Parliament, but it is always desirable that important legislative measures should at the instance of adversaries be subjected to strict inquiry. The Court of Aldermen, the Common Council, and the Livery are not likely to be deluded by the insinuating suggestions of the promoters of any Municipal Bill. Mr. BEAL eloquently promises that, "if the City was amplified, the roof of the Guildhall lifted over the metropolis, its wealth, its prestige, its municipal experience, the glory it sheds over our municipal life, would become the property of the developed municipality." In the same sense Lombard Street and the Bank of England might be amplified if their wealth were to become the property of a developed multitude of shareholders. Owners of wealth are unfortunately for the most part selfishly unwilling to admit a developed proprietary. The citizens of London will assuredly object to be amplified by admitting Lambeth and Finsbury to a share in their corporate possessions. The roof of Guildhall shelters them sufficiently; nor is it easy to foresee the consequences of figuratively lifting and enlarging it so as to cover the metropolis. Except one or two constitutional monarchs, no potentate has ever been known so splendid, so useful, and so harmless as a modern Lord Mayor. It is not certain how his place might be filled by an amplified and developed successor. The device of bribing the Aldermen to consent to the abandonment of the property and privileges of their constituents would be transparent if it were addressed to children. The present Aldermen are to have seats for life in the new governing body, where they will form a small minority. Vacancies, as they occur, will be filled up by the vote of a constituency in which the liverymen will find themselves an

insignificant fraction. The members will only have seats in the new Corporation during the residue of their term of office; but they have less to lose than the Aldermen, and some of them probably hope to be returned by direct election.

It would at present be premature to form a decisive judgment on a great question which has never been sufficiently discussed. It is necessary for the moment rather to call attention to the importance of the proposed experiment than to determine its merits. The municipal organization of provincial towns has on the whole been successful and advantageous, although the system of election has been in some respects unsatisfactory. The statutory powers of the Corporations are strictly limited, though they are extensive, and on the whole they have been honestly exercised. As in all matters of government, the less conspicuous elements of municipal organization are often the most operative. The Town Clerk, and in some cases the Surveyor, exercises the influence of a sagacious man of business over the fluctuating democracy of the Town Council; and, as a general rule, professional men are in their own department not guided by factious motives. Sufficient securities are provided by law against the corrupt application of municipal funds; and the majority of the corporate body, though it seldom consists of the principal inhabitants, is almost always respectable in character and independent in circumstances. The magnitude of London, and the entire absence of local unity or patriotism except in the City, largely affect the conditions of corporate organization. London is six times as large as Glasgow, seven times as large as Manchester or Liverpool, twelve or fourteen times as large as Birmingham, and nearly twenty times as large as Leeds. In all those towns the inhabitants know much of one another, and they are commonly united by the interest affecting their special industry. In London no man knows his neighbour, and the wealthier residents would be equally unwilling and unable to obtain the suffrages of the constituency. A traveller might drive during the whole of a long summer day through streets and squares in which not a single house is occupied by residents below the rank of the upper middle class. If he could ascertain the opinion of the inhabitants, he would probably find neither a municipal candidate nor a municipal voter who cared to exercise his franchise. One of the greatest difficulties of modern organic legislation is the conventional impossibility of creating power, except in the form of household suffrage. The amplified and developed Corporation will simply represent the majority of the rate-payers. The largest town which at present enjoys the blessings of a popular municipality is the city of New York. No French Government has found it possible to entrust exclusively to elected representatives the local control of Paris. At present there would be no danger in London of the supremacy of a PÉTIOT, a FERNANDO WOOD, or a TWEED; but the security against the despotism of demagogues is more complete in the absence of a municipality. The allegation that the cost of professional service would be reduced by the substitution of a single government for a variety of local authorities may perhaps have some foundation; but the possible and doubtful saving in the salaries of engineers, clerks, and lawyers is a matter of secondary consideration. It is to be hoped that members of Parliament, and more especially that Ministers, will not make up their minds in a hurry.

SPAIN.

IT is impossible to calculate with any reasonable confidence the balance of probabilities in Spain. English newspaper Correspondents in foreign countries are almost always both honest and intelligent, but they can only report what they hear from informants who are often inaccurate and sometimes mendacious. The rumour of the plot against Don CARLOS now seems to have been unfounded, and although it is highly probable that a part of the population of the Northern provinces is becoming tired of the war, there is no reason to believe that any conspiracy against the Pretender has been formed. The civil war in the last generation ended with the treasonable surrender of Maroto in the Convention of Vergara. History seldom exactly repeats itself after so short an interval. The appointment of several Italian princes of the House of BOURBON to commissions in the Legitimist army indicates, although

it may be otherwise unimportant, an expectation that the war will continue. Don CARLOS himself has hitherto displayed no military ability, but it is impossible to deny that the claimant of a throne is in his proper place when he is even nominally at the head of his army. It now seems probable that the Carlists will be able to maintain their positions during the winter; and it is impossible to foresee the changes of circumstances which may occur in the course of a few months. The Government of Madrid has hitherto been unable to provide sufficient reinforcements for the army, and its finances will scarcely be re-established by the aid of the projected German loan. Berlin capitalists are not, as a rule, venturesome or speculative; and any sympathy which may be felt for the cause of the Madrid Government will scarcely assume the form of pecuniary contributions. At present the civil war threatens more than at any previous time to become chronic; and perhaps Don CARLOS may be the most efficient supporter of the power of SERRANO. As long as the war continues it will be necessary to retain a soldier at the head of the Government; and the contempt and hatred which the Republicans have fully earned will not subside during the continuance of the struggle for which they are principally responsible. If the son of Queen ISABELLA had attained full age, he would perhaps be preferred by the chiefs of the army to one of themselves as titular Chief of the State. For the present SERRANO has no competitor to fear, and SAGASTA relieves him of the details of administration. Unlike Marshal MACMAHON, whose position is in other respects similar to his own, the President of the Government in Spain is not troubled with the management of Parliamentary parties. The French Assembly has, in spite of external attacks and of divisions within its own body, steadily maintained for nearly four years the supremacy of the Legislature over the Executive authority; but in Spain successive Cortes have been at the disposal of any Minister by whom they were summoned. Whatever may be the true policy of the Spanish Government, there is at least nothing to be gained by a new appeal to the ridiculous decision of universal suffrage. If Don CARLOS were, in defiance of probability, to succeed in his enterprise, he would find the way to the establishment of absolute monarchy smoothed by the utter failure of representative government. The only Parliamentary quality to be found in Spain is copious eloquence unaccompanied by any portion of statesmanlike wisdom. At present generals are more in demand than orators, and they are more difficult to find, yet it is possible that the inability of LASERNA and MORENO to make any impression on the enemy may be caused rather by the insufficiency of the materials at their disposal than by their own incapacity. CONCHA seems to have been the only general who had the gift of inspiring the troops with confidence. Since his death nothing important has been done, and the season is becoming too late for active operations in a mountain country. A year has now elapsed since the recommencement of the war.

The reasons for addressing the recent remonstrance to the French Government have not been disclosed; and the Duke DECAZES has judiciously withheld an immediate answer. If the object of the Government of Madrid was to gratify Germany by displaying an unfriendly disposition towards France, it is not easy to understand how their deference is to find a reward. The formality of recognition by the majority of European Governments was the only service which any of them can render to Spain. Diplomatic newsmongers have since affected to explain the interference of the German Government in Spanish affairs by a supposed divergence of its policy from that of Austria and Russia in relation to Servia or to Turkey. It is more probable that the recognition was accorded as a warning to Don CARLOS in consequence of the murder by his officers of Captain SCHMIDT. The suspicious advocacy of foreign intervention by a Madrid newspaper which is in the confidence of the Government appears to have been rather a hint or invitation to Germany than the disclosure of a secret. It was, in fact, absurd to expect that the German Government would wantonly engage in a remote quarrel with the ulterior purpose of encountering France on the most unfavourable ground. In ordinary circumstances a reasonable estimate of the interests of States forms a better guide to their policy than reliance on professedly confidential information. It happens from time to time that, like NAPOLEON III. in 1870, Governments suddenly plunge themselves into unnecessary and inextricable difficulties; but, as a general rule, risks are only

undertaken in the hope of advantage, and nothing is to be got by meddlers in Spanish complications. Forty years ago England and France were induced by plausible reasons to support the dynasty which was then supposed to be identified with the cause of constitutional government. It is possible that LOUIS PHILIPPE may even at that time have contemplated a matrimonial alliance for one of his sons. Lord PALMERSTON pursued a systematic policy of raising barriers against absolute monarchy, which he regarded, perhaps on insufficient grounds, as antagonistic to English interests. Since that time experience has in some degree confuted the theory that similarity of domestic institutions tends to promote sympathy between nations.

The domestic affairs of Spain have now for nearly two years diverted attention from the distant conflict which has nevertheless contributed largely to increase the embarrassments of successive Governments at home. There has been no cessation of the drain of troops to Cuba; and it is probably thought expedient to select regiments which are comparatively veteran for colonial service. Shortly before his abdication King AMADO was supposed to have expressed an intention of proceeding to Cuba for the purpose of combating the insurrection in person. After his departure, the anarchical Governments which succeeded had enough to do in attempting to reconquer Cartagena, and in dealing with the commencement of the Carlist rebellion. SERRANO on his accession to power was compelled to provide for the military wants of the colony; and at a later period he appointed General CONCHA as Captain-General of Cuba, at the same time at which Don MANUEL CONCHA assumed the command of the army in the North. Since that time little has been heard of the insular campaign; but it is known that it still continues. The affairs of Cuba appear of late to have excited little interest in the United States; but perhaps the latest intelligence may tend to revive the sympathy for the rebels. General CONCHA has announced that in future all insurgents taken in arms will be shot. It is possible that his determination may have been anticipated in practice, for Spanish officers and soldiers seem ready on the slightest occasion to disregard the modern customs of war and the restraints of humanity. General CONCHA probably wishes to produce an impression that there is no longer any regular war, so that insurgents in arms may properly be regarded as ordinary criminals. If the insurrection could be finally suppressed, even by excessive severity, the restoration of peace on any terms would be in itself beneficial, but society in Cuba is too thoroughly disorganized to allow of prolonged tranquillity. When there is again a question of incurring the sacrifices by which alone Spanish sovereignty can be maintained in Cuba, it may possibly be found that domestic disorder has abated the sensitive patriotism which has hitherto rejected all proposals for the abandonment of the island. American politicians who desire the annexation of Cuba will best promote their object by abstaining from all announcement of their wishes. More prudent statesmen are well aware that the colony is a dead weight on the mother-country, that it is incapable of governing itself, and that it would be an undesirable acquisition to a foreign Power.

OPPOSITION CRITICISMS.

THE holidays are so far over that the proceedings of the next Session are beginning to attract the attention of the political world, and the Opposition, which is free from responsibility, is naturally on the alert, and seeks to say all it can say as early and as forcibly as possible. The *Edinburgh Review* publishes the regulation party manifesto. Mr. GOSCHEN has lectured at Bath on the duties and powers of Liberals, and Mr. BOUVIER has had at Glasgow that opportunity of expounding the sentiments of a judicious Whig which the ungrateful electors of Kilmarnock have denied him in the House of Commons. Most of these utterances of Opposition criticism are rather true than new. It is quite right they should be made, but they are not entertaining. Every one can see at a glance that they are superficial, dealing only with small things and never going down into the depths of Liberal difficulties. Still it is quite within the province of an Opposition to pass such criticisms. The check upon each successive Ministry in turn is that it has to stand the test of such criticisms, and knows that its conduct is keenly watched and its blunders faithfully recorded by its adversaries. An Opposition which did not make

the most of every Ministerial blunder, and seek every sign of dissension in a Cabinet, would not generally be understood to be an Opposition. Parties must have something to live upon; and when a party is in office it lives on tramping its own achievements, and when it is out of office it lives on ferreting out the errors of the Ministry. There are circles, we may suppose, in which each new number of the organ of sagacious Whiggery is greeted as an oracle of instruction for those Liberals who want to wound their enemies without committing themselves. If the Liberals of Bath took the trouble to go through all the mournful weariness of a public festival and ask Mr. GOSCHEN to visit them, they want some little matter for laughter to cheer them, and would feel a legitimate disappointment if he did not enliven the evening by poking some sort of fun at the Conservative Cabinet. For this sort of political writing and speaking Mr. DISRAELI's Ministry has, it must be owned, furnished a considerable amount of material. It did not get on very well last Session. It took up measures and dropped them in a curious haphazard sort of way. It got into a mess with the Licensing Bill. It failed through its own fault to carry some measures on which it had laid great stress. It showed that in a new Cabinet all did not think exactly alike. It committed unquestionable mistakes. No impartial Conservative can deny that it was a mistake to interrupt all legislation at the end of the Session in order to propose the Endowed Schools Bill if the Bill was not worth insisting on, or that Mr. DISRAELI was both unjust and uncivil in making Lord SALISBURY the mark of the mirth and contempt of the House of Commons, for using expressions which Lord SALISBURY had never used at all. These were mistakes, and it is as much a duty as a triumph to the *Edinburgh Review* and Mr. GOSCHEN to make the most of them. Perhaps even it may be allowed that the *Edinburgh* is right in the curiously minute way in which it tests the proceedings of the last Session by referring them to the Queen's Speech on the opening of Parliament. Here is a measure, it points out with rapine, put in the Queen's Speech and not carried. Here is another carried and not put in the Queen's Speech. Are these the men to govern a great country? This is, it must of course be owned, not the very highest style of party warfare. It is akin to the glorious excitement with which an attorney's clerk, perusing a draft lease sent for approval by an opposition firm, cries out to a brother-clerk, "By Jove, they have put in 'cavaliers' and left out 'waste-pipes.'" But still these things are good in their way. If leases are to be framed, let them be framed correctly. If Queen's Speeches are to be penned, let the Ministry pen them carefully, and leave itself as many loopholes as possible.

It is a source of more serious satisfaction to Liberals to discover that the present Ministry has hitherto found itself obliged or willing to walk in the paths chalked out by its predecessors, to recognize Liberal victories, to yield to that moderate Liberalism of the country which never substantially wavers, and to own that there might easily be a Liberal reaction if due account were not taken of public feeling. Nor is it only in the larger questions of politics that Mr. GLADSTONE and his colleagues have had the triumph of seeing their successors justify them. Mr. GOSCHEN especially has had a great triumph, and has won a victory which he is entitled to find peculiarly gratifying. He was at the head of the navy for some years, and his administration was the constant theme of Conservative taunts. His successor, Mr. WARD HUNT, entered on office with the firm persuasion that Mr. GOSCHEN had done everything wrong, and that he was going to put everything right. He convinced himself that the service was going to the dogs, and the navy of England was a mere phantom. It was in this spirit that he spoke when he proposed his Estimates, and then he was challenged to prove what he said. Argument succeeded argument, and he was fairly talked down. His colleagues refused to support him, and he had to own that he should be quite content if a very few more thousands of pounds were spent on the navy. Later in the Session the Opposition as a whole won a decisive battle, in spite of the fowness of their numbers, by compelling the Ministry to abandon the Endowed Schools Bill. Mr. GOSCHEN is quite right in saying that the main business of the Liberal party at present is to take care that their opponents shall be really Liberal, although they may call themselves Conservatives. This is an effort which each party makes in turn, and the Conservatives not only tried but managed

to make Mr. GLADSTONE's Ministry, especially in its later days, much more Conservative than it wished to be. But many Liberals seem inclined to fulfil the task of keeping the present Ministry Liberal by insisting on a very dangerous argument. They insist that the present Parliament is bound by all that its predecessor thought, or did, or said. They regard all the utterances and wishes of Mr. GLADSTONE and his supporters as binding on the nation by a solemn and eternal compact. This is really Conservatism of the most stupid sort. It is to chain a living Parliament to the body of a dead Parliament. The nation lives, and grows, and thrives, and it must do for itself the best it can under every fresh change of circumstances. Some decisions, indeed, to which our Parliament has come cannot easily be reversed. No Conservative Ministry could now restore Protection, or re-establish the Irish Church. But there are many matters of detail which may be decided in one way or in another way according as may seem best, and the Conservative Government is perfectly entitled to decide them in its way if it thinks it wise to do so. What the Liberals have to do is to prove that their way of deciding them is the best, to argue, to reason, to convince the nation if they cannot convince Parliament. If the present Government deals with University Reform, and deals with it in a fashion agreeable to Conservatives, will the Liberals of a future Parliament hold themselves bound by a solemn and eternal compact never to upset any portion of the arrangement? We may be sure they will not, and that Liberals will not have the slightest notion of doing as they now ask to be done by. They will use their power when they get it, and the real check on them will then be exactly the same as that which now operates on the Conservatives—the feeling of the country.

To criticize the blunders of the Ministry, and to keep a Conservative Government as Liberal as possible, are highly proper functions for the Opposition to discharge; but sensible Liberals must be aware that the most perfect discharge of these duties will do very little to repair the smash of the Liberal party. On the contrary, the more that salutary criticism keeps the Ministry from blundering, the more that Liberal reasoning makes the Ministry Liberal, the longer will the Liberal party be excluded from office. If any one doubts it, he may be invited to study Mr. BOUVERIE's instructive speech. Why is Mr. BOUVERIE no longer member for Kilmarnock? Mr. BOUVERIE tells us—and he certainly ought to know—that he lost his seat because he spoke and voted against the Irish University Bill. There were enough Irish Roman Catholics in his Scotch burghs to turn the scale against him. Here is a perfect specimen of the difficulty which besets all moderate Liberals on the Liberal side. They have got to please somebody or some clique whom it revolts their good sense and conscience to try to please. To keep his seat Mr. BOUVERIE would have had to vote for a Bill which he thought very dangerous to the Empire. In one shape or another most Liberal candidates have to go through the same thing. They have to reckon with the Permissive Bill clique; or the Contagious Diseases clique, or the Women's Rights clique; or they are called on to forget Political Economy, and go in for some form of Socialism. The plain fact is that the nation is moderately Liberal, and moderate Liberals are now in power, whereas they would not be in power if Mr. GLADSTONE and his colleagues came into office. On both sides there is an extreme party, but it is practically much easier to make extreme Conservatives follow a Liberal lead than to make extreme Liberals follow a moderate lead. Take away the cliques, and the Irish Catholics, and the Home Rulers, and the Socialists, and the Liberal party is all head and no tail. This is not the kind of party which the nation wishes to see in office. Mr. BOUVERIE would evidently prefer to be out of Parliament and see the present Government in office to regaining his seat, and being invited to join a new Cabinet as the price of having to sell his independence to sets of people whom he dreads or despises. And Mr. BOUVERIE is a very fair type of moderate Liberals generally. They care for things much more than for names, and as long as the present Government fairly represents their views, they are very indifferent to the Government calling itself Conservative. The dissensions of the Conservative party are very much exaggerated; and if Mr. DISRAELI's attack on Lord SALISBURY showed that there are dissensions, Lord SALISBURY, by remaining in office, showed that Conservatives have enough public spirit to overlook great provo-

cation in order to do what they consider the best for the country. The Conservatives, although they differ, belong to what may be termed the same set of people, whereas Mr. BOUVERIE no more belongs to the same set as an Irish priest or Mr. BRADLAUGH than an Ashantee belongs to the same set as an Esquimaux. The Conservatives can therefore be much more easily brought to consider what is best on the whole for their party or for the nation. If the substantial unity of the Conservatives is compared with the substantial unity of the Liberals, there will be found good reason to suppose that the period during which the *Edinburgh* will have to occupy itself with checking off QUEEN'S Speeches, and Mr. GOSCHEN will be engaged in keeping Ministers straight, will be one of considerable length.

THE FRENCH ELECTIONS.

THE French Government have on the whole acted wisely for their own purposes in taking the elections piecemeal. Some surprise has been expressed that they should have wished to spread the political excitement which these contests necessarily keep alive over several months, instead of taking them all at once and getting the annoyance over. But the effect of successive elections and of a large batch is not quite identical. In the latter case it is the general result that attracts attention, and the more so when that result is exceedingly decisive. Ten or twelve elections going in favour of the Republic on a single Sunday would have been a very great shock to the Septennate. When they come three at a time, the details of each event are more closely looked into; and in the present state of France there is usually some feature of an election with which the victorious party has no great cause to be satisfied. On Sunday the most interesting contest took place in the department of Seine and Oise, and if a large number of elections had been decided on the same day, the result would probably have been accepted alike by friends and foes as an unalloyed triumph for the Republicans. M. SENARD has polled 15,000 votes more than his opponent; what more can a successful candidate wish? The Republicans have carried the day, and carried it by a respectable majority; short of a unanimous election, how could they have done much better? But though M. SENARD has polled 60,000 votes, his adversary managed to carry off 45,000, and when it is considered who and what his adversary is, this is a very startling fact. Amidst the confusion of many contemporaneous elections, this part of the case might have been passed over. Now there has been time to remember that the Duke of PADUA is at this moment quite a typical Bonapartist. There is about him something of the champion and something of the martyr. He has fought and he has suffered. He has defied the Prefect and the President, and he has in consequence been banished from the noble army of Mayors. In Seine and Oise, therefore, there are 45,000 actual voters, representing probably a considerable number of silent electors in addition, who are ready to support as pronounced a Bonapartist candidate as could possibly have been brought forward. They know what the Duke of PADUA wants, and they have discovered that they want the same thing. This would have been a remarkable fact in any incident of France, but it is especially remarkable in a department which was the chief theatre of the Prussian occupation, and suffered more perhaps than any other in the war which till lately it was the fashion in France to charge wholly upon the Empire. There must have been a very great change in public opinion before an Imperialist candidate can have found 45,000 avowed supporters in Seine and Oise. It is true probably that these 45,000 voters were not all declared Bonapartists. The clergy took the side of the Duke of PADUA, and their journals urged the electors not to adopt the policy of abstention recommended by some of the organs of the Government. It may be supposed that the Orleanists themselves did not entirely hold aloof from the contest, and if they voted at all there can be little question that they voted against M. SENARD. Whether, if they had now to make a final choice between the Republic and the Empire, they would give the lie to all their antecedents and prefer political stagnation to political excitement, is perhaps not certain, but it is clear that for the present they are perfectly willing to do so. It may be that they are only finessing, that their object is to use the Imperialists to beat the Republicans, in the hope that they will then be strong enough to beat the Imperialists, and that, if they find this

last hope disappointed, they will be ready in the last resort to ally themselves with the Republicans against the Empire. But this deduction from the Bonapartist strength is more apparent than real. It is now that Orleanist and clerical support is of most value to the cause of the Empire, and, provided that it is forthcoming now, the Bonapartists will not care much under what circumstances it is withdrawn. The sick man is fast recovering, and, provided that he can have a stick to help him when he first begins to walk about, it is all the same to him whether it is his own or borrowed. By the time that the Orleanists have discovered that the Empire is a more formidable danger than the Republic, the Imperialists will be in a position to care very little what the Orleanists think. The nation will have grown accustomed to regard them as the party which is best able to give France a settled Government, and when once this conviction has been established it will be strong enough to override all opposition.

On November 8 three more elections come on. In the department of the Oise the Duke of Mouchy presents himself as the Imperialist candidate. Unfortunately he is opposed by two Republican candidates, and there is reason to think that neither of them is likely to give way. The Republican party has of late avoided with commendable prudence those internal divisions which are almost inevitable when men of widely different opinions are united in pursuit of a common end. Under the influence of M. GAMBETTA the extreme Republicans have virtually abdicated their claims to guide the counsels of the party. They have accepted the leadership of M. THIERS in the Assembly, and they have voted for moderate candidates in the elections. They now appear to think that they ought to be allowed to impose a candidate of their own upon the united party, and accordingly they have brought forward M. ANDRÉ ROUSSELLE in the Oise. They urge in his favour that at the last election in the department he was only 6,000 votes behind the successful candidate, and that, though his election to the Council-General has been twice set aside, he has a third time been elected. The moderate Republicans propose M. LEVAVASSEUR, on the ground that, in presence of so dangerous an opponent as the Duke of Mouchy, it is essential not to alarm the more timid Republicans, who may easily be driven into not voting at all, even if they do not vote for the Duke of Mouchy. It is naturally difficult to persuade an extreme section that it is their duty to yield on all occasions to the moderate section. They are disposed to plead that one good turn deserves another, and that, considering how often they have voted for moderate candidates, the moderate section ought now to be willing to vote for an extreme candidate. Of course this reasoning leaves out of sight the exceedingly important fact that, whereas the extreme Republicans would rather see a moderate Republican returned than an Imperialist or an Orleanist, the moderate Republicans are not able to return the compliment. Probably many electors in the Oise who, if the contest lay between the Duke of Mouchy and M. LEVAVASSEUR, would vote for M. LEVAVASSEUR, would unhesitatingly vote for the Duke of Mouchy if the contest lay between him and M. ROUSSELLE. Without in the least comparing M. ROUSSELLE to Mr. BRADLAUGH, the circumstances of the Oise election may be compared to the circumstances of the recent election at Northampton. You might have preached to Mr. FOWLER's supporters for ever without bringing them any nearer to withdrawing their candidate in favour of Mr. BRADLAUGH. Indeed, if Mr. FOWLER had withdrawn, it would not have benefited Mr. BRADLAUGH in the least degree. The voters thus set free would either have voted for Mr. MEREWETHER or have stayed at home. There is this important difference, however, between the two cases—Mr. BRADLAUGH did not care one pin whether Mr. MEREWETHER or Mr. FOWLER got in. He regarded them both with impartial dislike. Consequently it was of no use to prove to him that, if two nominally Liberal candidates went to the poll, the result would be to seat the Conservative candidate. He would have answered that from his point of view there were two Conservative candidates and only one Liberal; and if the Liberal candidate was beaten, it was immaterial to which of his adversaries he had to give place. M. ROUSSELLE does not take this line. He and his friends admit that their principal anxiety is to get a Republican candidate returned, and that, though they would prefer to have a representative exactly of their own way of thinking, they would very much rather be represented by M. LEVAVASSEUR than by the Duke of Mouchy.

After all, however, the controversy is of less importance under the French electoral law than it would be if it related to an English election. It is essential of course that M. LEVAVASSEUR should not withdraw, since this might throw a large number of his supporters into the arms of the Imperial candidate, who might in this way secure the requisite majority at the first ballot. But it is not essential that M. ROUSSELLE should withdraw, because, if both he and M. LEVAVASSEUR stand together, the Duke of Mouchy must have a majority over the aggregate votes given for them in order to secure his election on the 8th of November. Assuming therefore that, if M. LEVAVASSEUR stood alone, he would beat the Duke of Mouchy, the same result will be obtained if M. LEVAVASSEUR and M. ROUSSELLE between them beat the Duke, and M. ROUSSELLE then retires before the second ballot. It may be said that this is only to postpone M. ROUSSELLE's sacrifice and that if he is in any case to withdraw in favour of M. LEVAVASSEUR, he may as well do it first as last. But this way of stating the case is not strictly true. M. ROUSSELLE will have been allowed to ascertain whether his influence with the constituency is sufficient to carry him at the first ballot, and, if he afterwards has to retire, whether he or M. LEVAVASSEUR get most votes, it will be because he can count upon transferring all his votes to M. LEVAVASSEUR, whereas M. LEVAVASSEUR could not be sure of transferring all his to M. ROUSSELLE. In this way the advanced Republicans are to some extent the sufferers by their superiority of discipline over the moderate Republicans. M. GAMBETTA's troops will serve under M. THIERS's flag, but M. THIERS's troops cannot be trusted to pay similar obedience to M. GAMBETTA. But the fact that the advanced Republicans have so often been willing to make concession shows a great advance in their aptitude for practical politics. If they persevere in the same course, they will do more to establish the Republic than they could effect by any number of electioneering victories.

POLITICS IN AMERICA.

THE American autumn elections involve little difference of principle; but the advantages which the Democratic party has already gained may not improbably modify the policy of the still dominant Republicans. Two important States, Ohio and Indiana, have given majorities to the Democratic candidates for Congress. The Pennsylvania election will not take place till November; and its result may probably be affected by the decisions of other principal States. In New York the actual Governor, General DIX, seeks re-election with all the advantage derived from a high personal character and from a term of successful administration. The anxiety of his supporters is shown by their eager revival of the scandals which were perpetrated a few years ago in the city of New York by their political adversaries. It is admitted that Mr. TILDEN, the Democratic candidate, enjoys an unimpeached reputation; but the Republican canvassers remind the electors that he bears the same political designation with the former managers of Tammany Hall. The truth is that TWEED and his accomplices were essentially swindling adventurers, and only by accident Democrats. If the Irish rabble of New York had chosen to call themselves Republicans, the demagogues would have changed sides without hesitation. As both parties are represented by creditable candidates, the election will be a fair trial of strength; and probably the result of the last political contest may be reversed. The Democrats were strong enough to carry the State in the most depressed condition of their party soon after the close of the war; and the election of General DIX may probably be attributed to the reaction against TWEED and his confederates. In New York, as in some other parts of the Union, the Republican party is becoming unpopular in consequence of its long possession of power. For fourteen years the Democrats have ceased to control Federal policy, and consequently they are not responsible for the scandals or the disappointments which have since occurred. The elections which have already taken place reduce the Republican majority in Congress below the proportion of two-thirds which enables it to propose Constitutional Amendments or to pass Bills which have been disapproved by the President. It happens that no such Amendment is at present contemplated; and the recent veto of the President on the Currency Bill was not overruled.

An approximately equal balance of parties tends to make the possessors of power more scrupulous. Prudent Republicans are beginning to disclaim complicity with their disreputable allies in the Southern States. The party still thinks itself bound to sustain the PRESIDENT in his determination to support the authority of the State Government of Louisiana; but the Republican newspapers contain significant admissions that KELLOGG and his proceedings are a dead weight which it would be desirable to remove from the shoulders of the party. There can be little doubt that the PRESIDENT judged rightly in repressing by force the irregular assumption of the government of Louisiana by the more respectable inhabitants. It would be an intolerable nuisance that in any State of the Union there should be a pretended Government *de jure* contending with a Government *de facto*. It was better to take any side than to remain neutral, and it would have been a proof of weakness to disavow the Government which had already been recognized at Washington. KELLOGG himself has, since his reinstatement in office, published an apologetic statement which illustrates both the political morality of the whole community and the real character of the local contest. He boasts that, with the unanimous approval of both parties, he has reduced the State Debt from twenty-five millions to fifteen millions of dollars by the simple process of inducing the Legislature to repudiate two-fifths of the amount. The Conservative party, while it cordially concurred in the fraud on the public creditor, objected to a Constitutional Amendment by which future loans are prohibited. It is difficult to assign any reason for a measure which, if the law is observed, will place difficulties in the way of schemes for obtaining further subsidies from credulous capitalists. KELLOGG defends the validity of his own election by a curious argument. Assuming that he received the votes of all the coloured electors, and of a few thousand white renegades, he contends that he must have been duly returned. He admits that the white inhabitants of the State form a numerical majority of the population, but he alleges that many thousands among them are disqualified as aliens. Without pretending to any knowledge of the statistics of Louisiana, strangers may conclude with perfect confidence that a white majority, with or without legal right, will find means to assert its own supremacy over the coloured minority. Even if KELLOGG were the most upright of politicians, he belongs to the weaker party. The increased strength of the Democrats will encourage the whites in all the Southern States to exert themselves in recovering political power.

The only political issue which concerns the remainder of the Union is the question whether the PRESIDENT is to be re-elected for a third term. The rule which is derived from the counsels and practice of WASHINGTON is a remarkable instance of the tendency to affix traditional interpretations to the most explicit and authoritative documents. The framers of the Constitution had only a few years before the retirement of WASHINGTON deliberately left the people of the United States at liberty either to return a President for a single term of four years or to re-elect him as often as they might think fit. It has not since seemed necessary to provide by an Amendment of the Constitution for the perpetuity of the custom which has been pursued for eighty years. After the commencement of General GRANT's second term of office it occurred to his personal supporters, and perhaps to himself, that no constitutional impediment would prevent a second re-election. Republican managers began to consider whether a novelty in the selection of a candidate might not please the popular fancy. Their opponents indeed declared that a President holding office for twelve years, and perhaps for life, would be a dictator and a CÆSAR; but the people of the United States well know that General GRANT is quite unlike JULIUS CÆSAR, and that the Republican form of government is not in the smallest danger. The only consideration which is likely to weigh with the Republican party is the probability of electing their candidate. For the present they shrink from committing themselves to a choice which might perhaps be fatal to their cause. The Republican Convention of Pennsylvania not long since started a local candidate of their own whose claims have not hitherto been sanctioned by the party in any other State. It was asserted that the delegates to the New York State Convention were privately inclined to support the candidature of General GRANT, although they ostensibly contented themselves with the nomination of General DIX for the office of Governor of New York. When a considerable number

of persons agree to keep a political secret, it may be inferred that in their judgment a disclosure of their real purpose would not be advantageous to their cause. For the immediate object of the contest in New York it is deemed expedient to disclaim any intention of disturbing the ordinary practice. It was even thought worth while to induce a member of the Cabinet to assert in a public speech that General GRANT had no intention of offering himself for re-election; but the general incredulity with which Mr. ROBESON's statement was received is not less significant than a disavowal which is perhaps literally true. General GRANT will not be a candidate unless he is invited by the party; and the Republican managers will not make up their minds until they have ascertained the prospect of success. If the established practice is opposed to General GRANT's pretensions, his superiority in reputation or in notoriety to any competitor may perhaps be thought a counteracting advantage. The political condition of America is singularly unfavourable to the production of statesmen or eminent men. General GRANT possesses considerable acuteness, he has now acquired experience in administration, and, above all, his services as a soldier greatly outweigh the performances of any mere politician. No one has thought of choosing General SHERMAN or General SHERIDAN, and the claims of any other military leader would be far inferior to those of General GRANT. It has happily become impossible to make General BUTLER the candidate of the party, although the allegation that he had received a bribe from KELLOGG failed to affect a reputation which has long since been incapable of deterioration. Mr. SCHURZ, who is the best speaker and perhaps the ablest politician in the Senate, has on more than one occasion deviated from strict Republican orthodoxy, and he is by birth a foreigner. General GRANT would probably have a larger following in the Southern States than any other Republican candidate; but it is almost certain that there will be a formal contest for the Presidency between the two great parties. At the last election the Democrats, with the aid of a disaffected section of Republicans, obtained two-fifths of the total number of votes, although General GRANT was chosen by a large majority of States. The nervous alarm of the Republicans is founded on sufficient grounds.

A PHILOSOPHER'S LEGACY.

IT might almost be imagined, from the sort of excitement which has been got up by some of the newspapers in regard to the publication of Mr. MILL's posthumous essays, that the whole nation had previously been waiting with breathless anxiety for the disclosure of this wonderful bequest. Country newspapers make desperate efforts to get an early copy of the precious work, and flood their columns with anticipatory extracts from it. The *Times* has a leader about it which in its ingenuous simplicity reminds one amusingly of the Palmerstonian theology; and of course the *Daily Telegraph* follows suit, though without rising to that romantic fervour with which it is in the habit of celebrating the two great festivals of the Christian year. One can conceive the bewilderment of foreigners on finding in what they call "the journal of the City" a leading article on Religion, Nature, and Revelation. They will be led to suppose that Mr. MILL was surely a great prophet who was worshipped by his countrymen as an oracle of perfect and unfailling wisdom, and whose final utterances were awaited with reverent awe and pious expectation. This may have been so, but we are bound to say that we had not previously discovered any trace of the fact. Mr. MILL acquired his philosophical reputation by his writings on logic and political economy, which are remarkable rather for lucid interpretation than original thought. His entrance into public life was hailed with ridiculous, and to some extent factitious, enthusiasm by a little knot of fanatical admirers, and also by politicians who trusted that their party would profit by his advocacy in the House of Commons; but most people were at least hopeful that he might have something useful to say on the special subject of his studies. The unfortunate deficiencies of his character and mental constitution were, however, soon displayed. An impulsive sentimentality which, cruelly repressed in youth, revenged itself by returning with spasmodic force in later years, gave an eccentric direction to his logical speculations, and his ignorance of human nature and want of practical wisdom betrayed him into fantastic projects and dangerous alliances. His political career was a failure, and the

weaknesses which it disclosed justly diminished his scientific authority. The publication of his *Autobiography*—the most pathetic confession of our time—revealed the abnormal experiences through which he had passed, and explained the wayward twists and caprices of a disordered mind. It was announced at the same time that he had left behind him a series of essays in which were embodied his final and matured conclusions on the gravest of all subjects; but the announcement was received with little curiosity and not much hope. The tree is known by its fruit, but the character of the tree also enables one to judge what sort of fruit may be expected from it. In this case it was foreseen that the apple would be sour and cankered, with a worm at its wasted core.

The dulness of the season probably accounts for the absurd importance which has been attached to the publication of a work the interest of which had already been discounted by the painful disclosures of the writer's autobiography. It appears that two of the essays contained in this volume were written between 1850 and 1858, and that the third was written between 1868 and 1870. Mr. MILL had thought of publishing the first of these—that on Nature—in 1873, but deferred doing so. It is not stated whether he desired the posthumous publication of these papers, but there can be little doubt that it will be injurious to his memory. They are marked by crudity, and even incoherence, as well as by flagrant faults of temper. The editor describes them as “the carefully-balanced result of the deliberations of a lifetime”; but the last of them, at least, has rather the aspect of casual and hasty reflections on a subject which the writer had previously not had leisure or inclination to attend to. The first essay is an animated, and even vituperative, attack on the system of nature. Mr. MILL is not the first philosopher who has said to himself that it would have been well if he had been consulted when the world was made. He is shocked at the “ignominious failure,” and can hardly find words strong enough to express his contempt for “so clumsily made and capriciously governed a creation ‘as this planet and its inhabitants.’ Everything is more or less mismanaged. Even the human body is a blunder, for it is too complicated, and wears badly. Blind partiality, atrocious cruelty, and reckless injustice abound to excess in the commonest phenomena of nature. All that man is continually trying to do to make this wretched world decently fit to live in is a practical accusation against nature, who, we are told, stands to man in the position of an enemy from whom he must wrest by force and ingenuity what little he can for his own use. Mr. MILL, we gather, would have begun by relieving man from the necessity of exerting himself in this way. The world would have been provided at the outset with bridges, embankments, breakwaters, lightning-conductors, and, we suppose also, electric telegraphs, railways, steamboats, and lucifer-matches. It is known that Mr. MILL was learning Greek at three years old, but if he had only been his own Creator he would have taken care that little boys should be born with a ready-made knowledge of Greek and everything else; or rather that there should be no little boys at all, but that men should come forth at once full grown and fully endowed. The forces of nature seem to have inspired Mr. MILL with a childish feeling of hate and terror. POPE’S “Shall gratification cease when you go by?” may, he says, be a just rebuke to any one who is so silly as to expect common human morality from nature; but if the question were between two men, instead of between a man and a natural phenomenon, this would be thought a rare piece of impudence. “A man who should persist in hurling stones or firing cannon when another man ‘goes by’; and, having killed ‘him,’ should urge a similar plea in exculpation, would ‘very deservedly be found guilty of murder.’” In short, he adds, nearly all the things which men are hanged or imprisoned for doing to one another are nature’s everyday performances. The philosopher would evidently have liked to hang nature if he could, but natural phenomena are unfortunately beyond the reach of the criminal law. The general conclusion at which he arrives seems to be that the Principle of Good would long ago have broken down in a hopeless struggle with the maleficent powers if the Creator had not been helped by his creatures to do what he could not do for himself, and that it is high time that men should recognize their own merits, and worship themselves as the real saviours of the world.

There is, of course, nothing new in the tirade against the injustice and ferocity of nature. It has been often

heard before, and will often be heard again, and a philosophy which can only repeat the stale indictment is not much to be thankful for. In the first essay there are evident traces of the influence of the Manichean convictions of the elder MILL. In the second, while it is acknowledged that Christianity has rendered a great service in establishing a system of pure and exalted morality, it is urged that this has now become the property of mankind, and that the supernatural character which was at first attributed to it, and which was perhaps necessary in order to secure its general acceptance by mankind, may be safely abandoned. There is an obvious flaw in the logic of the argument that, because Christianity has achieved so much, it would now be well to give it up and try a substitute of a novel kind. But the admission is significant that a substitute is indispensable. If Mr. MILL had lived less in the closet and more in the world, he would perhaps have understood the hopelessness of attempting to lift the world to the highest point of spiritual effort by means of that vague interest in “the universal good” which is called the religion of humanity. So far his system would seem to be a sort of compromise between the views which he derived from his father and the theories of COMTE. In the concluding essay he is disposed to surrender the immortality of the soul, but at the same time pleads for the systematic cultivation of hope “in ‘the region of imagination merely.’” Here, again, ignorance of human nature is betrayed in the supposition that hope will ever operate as powerfully as actual belief, or can be sustained without confidence in its realization. Humanity is not very likely to be kindled to enthusiasm by the process of allowing “the imagination to dwell by preference on those ‘possibilities which are at once the most comforting and ‘the most improving, without in the least degree overrating’”—that is, really believing in—the solidity of the grounds ‘for expecting that these rather than any other will be the ‘possibilities actually realized.’” Mr. MILL in effect says, “The only way of alleviating the great, and to a large extent inevitable, misery of existence, is by indulging in ‘dreams of possibilities which, however, you must be ‘careful in your waking hours not to expect to happen.’” In other words, existence is to be divided into two parts, in one of which man is to be oppressed by the desolation of reason, while in the other he is to console himself with the fitful satisfactions of the opium-eater. Mr. MILL’S own writings illustrate the natural results of the experiment. On the whole, these essays will be disappointing to those who expected much from them; but after reading the *Autobiography* the expectations of most persons must have been exceedingly moderate.

THE SCOTCH EDUCATION REPORT.

THE Board of Education for Scotland have presented their Report for 1873 to the Committee of Council. The first meeting of the Board was held in October 1872, but they were not able to begin regular work until the close of the year, so that the period covered by the Report is really identical with the first year of the Board’s existence. There has hitherto been a very general impression that, in the rural districts at all events, the Scotch provision for education is very much in advance of the English. The Report seems to show that this impression rests on nothing much better than assumption. In many parishes the school buildings were found to be quite inadequate for the children requiring education; in others they were almost in ruins; and, “notwithstanding the stringent provisions ‘of the law as it existed prior to the passing of the ‘Education Act, there are a number of parishes in which ‘heritors had neglected to provide either a school-house ‘or teacher’s dwelling.” The Board estimate that there are more than 70,000 children for whom there is at present no school accommodation. To meet a deficiency of this kind is a work of much greater difficulty in Scotland than in England. In many Highland parishes “the inhabitants are congregated in small groups many miles ‘asunder, and on islands separated by a wide extent of ‘open sea from the mainland or any other island.” Children cannot go to school if they have to cross mountains and lochs to get there. Education must be brought within their reach, and the consequence of this necessity is that schools have to be very much more numerous, very much smaller, and therefore very much more costly, than in Lowland parishes. In Gairloch, in Ross-shire, for ex-

ample, there are only 850 children of school age, or just the right number for one good school. But they are scattered along a seaboard ninety-six miles in length, and ten schools will be needed to take them all in. In Applecross there are only 443 children, but eight schools must be set up before they will all have a school within a possible distance from their homes. On one of the islands at the extreme south of the outer Hebrides there are thirty children of school age, and the lowest estimated expense of building a school and teacher's house is 800*l.* The annual cost of carrying on the school after allowing for the expected Government grant will be over 100*l.* a year. The whole annual rental of the island is only 57*l.* 7*s.* In a fairly well-to-do parish it is calculated that a threepenny rate will raise 7*s.* 6*d.* for each child in average attendance at school. But in Orkney a threepenny rate would only raise 1*s.* 11*d.* for each child, while in Shetland it would only bring in 1*s.* per child. It is clear that some special provision will have to be made for the children living in these parishes. The Scotch Education Act recognizes this necessity to some extent, but not apparently to an extent at all commensurate with the necessity of the case. By the 67th section a Parliamentary grant not exceeding 300*l.* may be made towards building a school in any parish situated in certain counties in which a school rate of not less than ninepence in the pound has been levied. But in many parishes a rate of ninepence in the pound, with 300*l.* thrown in from the Parliamentary grant, would not go more than half-way towards providing the school, and then the current expenses would remain to be met. In one Shetland parish it would take a rate of four shillings in the pound to carry out the provisions of the Act.

Professor RAMSAY has made a special report to the Board on the educational circumstances of Orkney and Shetland. He suggests that in some of the poorer districts the school might be carried on by a pupil teacher from a neighbouring school. This pupil or assistant teacher might live with the teacher of the chief school, and the expense of building a teacher's school house would thus be saved. The younger children would attend the subordinate school, while the bigger boys might get as far as the principal school, and the teacher of the latter might take his assistant's place one day in the week. The instruction thus provided would be better, Professor RAMSAY thinks, than it would be if a third-rate grown-up teacher were employed. In some of the islands, however, there will be no larger school within reach. A pupil teacher, for example, could hardly be detailed for service in Fair Isle or Foula, two islands containing between them about eighty children of school age, but situated forty miles out at sea, and maintaining no regular communication with the mainland. These are extreme cases, but there are many small islands which, if they had to depend on the visits of a teacher living on the mainland or in another island, would go without schooling many days in every year. Professor RAMSAY thinks that this case may be met by the employment of female teachers. The School Boards, he says, have, as a rule, a strong prejudice against this plan, "simply because they have 'never had experience of any female teachers but 'decrepit old women who have in neglected corners set 'up adventure schools of the most wretched kind.' The experience of America shows that there is no reason why women should not teach boys as well as girls with complete success, and it will probably be found very much more practicable to maintain trained teachers in remote islands if women are substituted for men. There will remain the islands in which there are only five or ten children to be taught and no day school for them to be sent to, unless one is specially set up for them. It appears that the School Boards are of opinion that it will generally be practicable to make arrangements for having these children boarded out among relatives or friends near some good school for as many months as will make up the 150 attendances required by the Code for children living more than two miles from school.

Professor RAMSAY'S Report also deals with the application of compulsion to these island districts. As regards actual distance from school, he does not think that it will be found a serious obstacle. The vast majority of the children of Orkney and Shetland will have a school within two miles of them. But the weather through which they will often have to go to school will be a very great obstacle indeed. During many months of the year "terrible gales sweep 'over the islands, and the rain comes, down in cold 'solid slices, at a cutting angle.' In winter there will

often not be six children in school out of sixty in general attendance. This especially applies to the younger children. As regards the elder boys, their labour is wanted during a great part of the year on the crofts or in fishing. "It is a common thing to find two crops of 'children attending a school during the year'—the younger coming in summer, when they are not kept at home by stress of weather; the elder coming in winter, when they are not kept at home by stress of employment. Professor RAMSAY rightly says that, as the compulsory clauses will have to be worked so as not to seriously interfere with the habits of the people, 'under no circumstances will it be possible for all the 'children of school age to be attending school at one time.' He has accordingly recommended School Boards in Orkney to be satisfied when there is school accommodation for four-fifths of the children requiring education, and School Boards in Shetland to be content with providing accommodation for three-fourths. In the Lowlands the Board of Education report that the operation of the compulsory clauses has on the whole been satisfactory. The mere announcement that the powers entrusted to the School Boards were about to be put in force has usually been sufficient to bring the majority of the defaulters to confess and promise amendment. In one district in Glasgow the School Board found more than 1,400 children not under instruction. Of these 1,090 are now at school, and in only six cases has it been necessary to take legal proceedings. In another district there were nearly 3,000 children not at school. Of these 1,400 have been got hold of without difficulty, and it is expected that another 1,000 will be sent as soon as accommodation can be provided for them.

HYPOTHETICAL HISTORY.

THE great question, what would have happened if something else had not happened, has exercised the ingenuity of many historians, and, but for a certain sense that it is not likely to lead to very profitable results, might have been a very popular amusement. In that day, which some thinkers profess to anticipate, when history will be reduced to a science, the problems thus suggested will doubtless receive more attention. The students who undergo the examinations of the future will be asked to sketch the history of England on the assumption that the Conqueror was beaten at Hastings, that the Spanish Armada had effected a landing, or that a bullet had gone through Cromwell's heart at his first skirmish. Knowing all the elements of the problem, and being provided with a perfect calculus of human nature, our omniscient descendants will be able to work out the results just as an astronomer could determine the motions of the solar system on the hypothesis of the planets having been placed at other than their actual distances. For the present our knowledge of such matters is so limited that it is useless to launch ourselves without chart or compass on the boundless sea of conjectural inquiry. Such questions as we have suggested have generally been put by those historians who delight in the maxim that great events spring from trifling causes; and who therefore contemplate history as the record of a series of accidents rather than of a regular evolution. If the world is but the scene of a great game of chess, the smallest alteration in the position of a pawn may bring about changes of the utmost importance. An inversion of the issue of any of the "fifteen decisive battles" might have radically altered all later history, and a bullet or an arrow might therefore have done the work. The historian, on the other hand, who attends exclusively to the deeper forces which are at work beneath the surface of society, is inclined to regard such events as only affecting the superficial order of occurrences, and determining rather the mode in which the result is attained than the result itself. The issue of a particular battle, he would say, may be determined by chance; but the issue of a struggle between two different races or civilizations will depend upon more permanent and ascertainable causes.

Except as bringing out such differences of principle, the discussion of the "might-have-been" is rightly assumed to be a rather childish amusement. But, though sensible men do not waste their brains over such profitless inquiries, a tacit reference to hypothetical history is exceedingly common, and affects a good many popular theories. All criticism of political action of course involves some tacit assumptions. If you say that a given line of policy would have produced a certain result, you assume that the policy was in some sense practicable, and this assumption frequently involves a great deal more than is at first sight obvious, and not unfrequently amounts to simply begging the question. If Louis XVI. had been a man of genius and courage, it is suggested, the catastrophe of the French Revolution might have been superseded by a gradual reform. This statement assumes that the social order was sufficiently sound to admit of a calm reconstruction; for the most intelligent architect cannot build an enduring edifice out of rotten materials. The whole question would therefore turn upon an estimate of certain facts as to which it is difficult, or rather impossible, to obtain at

the present day any conclusive information. When it is further attempted to draw some conclusions for our present guidance from such speculations, we find that the neglect of the necessary conditions has frequently made the whole argument worthless. Let us take, for example, a line of reasoning which is extremely popular with Mr. Carlyle and his disciple Mr. Froude. They are constantly pressing upon us the doctrine—a doctrine with which in this form we are certainly not disposed to find fault—that no policy can be permanently satisfactory which is not founded upon the eternal laws of justice, and which does not imply profound respect for facts and contempt for shams. The last ruler of England, they proceed to say, who acted in that spirit, was Cromwell; and all the evils from which we have since suffered would have been avoided if only we could have had an unbroken series of Cromwells from the days of the Commonwealth to our own. If it is replied that Cromwell's policy is condemned by the fact that it brought about the reaction under Charles II., they simply reply that Charles II. ought to have been another Cromwell. English policy in Ireland, as Mr. Froude has been recently telling us, has produced all kinds of mischief in both countries because we did not carry out the Cromwellian policy. If, instead of adopting the Parliamentary system with all its corruptions, we had uniformly done what was right with a strong hand, Ireland would long ago have been a Protestant, and therefore a loyal, country, and such things as Fenianism, Home Rule, and agrarian agitation would have been killed at the root. If we grant for the sake of argument the assumption upon which the whole argument exists—namely, that Cromwell was really the most upright and intelligent of rulers—it is obvious that the speculation is still worthless, because it involves an unjustifiable excursion into hypothetical history. If we are permitted to assume such a miracle as a continuous succession of perfectly pure and intelligent absolute rulers, why may we not make any other assumption which suits our case? Why may we not say, for example, that the system of policy actually adopted would have produced the most inestimable results if only the Irish Parliament had been always independent, intelligent, and honest? Once assume that any series of men, or of bodies of men, will always do exactly what is right, and you can have no difficulty in showing how Utopia may be at once realized even in Ireland. The answer which would be made to this objection would no doubt be that the constitution of the governing body was such as necessarily to generate corruption and incompetence. That, of course, was the case, because we know what actually happened. The experiment was tried, and the failure condemned the policy adopted. But then we have clearly no right to assume that an experiment which was not tried would have succeeded any better; whilst it might possibly have led to still more disastrous results. It is at least conceivable that a Cromwellian system of government in the hands of such men as ruled England during the eighteenth century might have produced an amount of corruption and oppression unparalleled in the history of the world. It is easy to give absolute power in imagination to a set of rulers, but the question as to the use which they would have made of it is one which would have to be determined from a careful examination of their disposition, and which is certainly not answered by the bold assumption that they would always have done right. And yet it is only by tacitly making this assumption that any colour of plausibility can be put upon the conclusions deduced for our benefit. If the British Empire were always under the government of a Cromwell everything would go right. This may or may not be true; but, true or false, it belongs to the domain of hypothetical history which has no points of contact with the actually existing world, and may be left for the consideration of persons who like to indulge in an idle play of the imagination.

It would be easy to illustrate the same fallacy from theorists of different schools; as in fact it is merely one version of the maxim common to all bold theorizers, *tant pis pour les faits*. The revolutionary party, for example, used to assure us, as the coarser exponents of their doctrines continue to assure us, that all tyranny was produced by the wickedness of kings, that superstition was invented by priests, and that women have been enslaved by the brutality of men. Abolish kings and priests, and give women equal rights, and all these evils will disappear. Once more we are in the region of hypothetical history. We are tacitly assuming that loyalty and faith were mere superficial fashions, and that the subordination of the weaker sex depended upon nothing but the physical strength of males. If those doctrines are true, mankind may be suited for a free and equal republic without a church and without marriage. But the advocates of such theories never trouble themselves to explain how, if mankind were naturally perfect, lying and bullying came to have such force, or how, if they are naturally imperfect, those powers of evil are to be suppressed for the future by a simple abolition of existing institutions. If we insist upon admitting facts and framing institutions for men as they are and not as they ought to be, we are indeed met by one difficulty. Are we not, in fact, drifting into a kind of political fatalism? Assume, it may be said, that whatever is could not have been otherwise, and of course all hypotheses will be purely frivolous. A bullet, it may be, has changed the course of history; but then the bullet could no more have taken a different path, or the man whom it hit have been standing an inch further to the right or the left, than a government could have been composed exclusively of virtuous persons, or than the earth could have followed a different orbit. It is therefore just as frivolous to say what would have happened had the

smallest conceivable change been made in the conditions of the problem as to say what would have happened if virtue and intelligence had been universally substituted for vice and stupidity. But to accept this doctrine would be to abolish all attempts to modify the course of human affairs, and to permit the great machine to go on grinding out happiness or misery, consoling ourselves as well as we can with the reflection that whatever is is right.

We shall certainly not discuss the everlasting problem of necessity *versus* free-will; but it is easy to observe that upon any hypothesis this is not the legitimate conclusion. Nobody disputes that our will, whatever may be the precise meaning of the word, and whether or not it may rightly be called free, can modify the course of human affairs within certain limits, which, moreover, may be very strictly defined. There are many things which a wise statesman can do, and many more which are entirely beyond his power. He cannot, for example, produce a spasmodic change in human character or in human beliefs; and he cannot foresee the future except in the most imperfect and conjectural fashion. If, therefore, according to the old phrase, we consider history as "philosophy teaching by examples," it may be profitable to consider what would have been the results of such a policy as could have been adopted by a statesman of the time, working with such materials as were at hand and upon such information as was then open to him. Directly we transgress these conditions we get into the unprofitable regions of pure conjecture. For example, it might be a profitable inquiry whether, if the policy advocated by Burke had been adopted, it would have been possible to save the British Empire in America. It is true that even such an inquiry involves some rather bold assumptions. It assumes that the English Government of the day was sufficiently enlightened, not indeed to be generally as intelligent as Burke, but to be capable of appreciating his wisdom. This is a bold hypothesis, but it is not beyond the region of the fairly conceivable, and therefore not beyond the range of combinations which may be expected to occur at some future time. By working it out we might derive some useful hints as to the colonial policy of the future. But it would be not only useless, but might very possibly be mischievous, to inquire what would have happened if all Englishmen and Americans in those days had been perfectly reasoning animals. It might, we say, be mischievous, because it would encourage the common fallacy that we may neglect the most essential condition of all political problems—namely, the stupidity and selfishness of the average human being. The hypothetical mode of reasoning is tempting, because it enables its author to take an apparently high moral point of view. He insists with great emphasis on the doctrine that a political system is good in so far as it is just and veracious. He becomes so eloquent upon this topic that he thinks himself entitled to pass over as degrading the subsidiary but all-important questions by what means veracity and a sense of justice can be cultivated amongst human beings, assuming them to be such as they actually are. He despises all questions of machinery as only worthy of grovelling utilitarians, and thus unconsciously slides into the immoral doctrine that the end justifies the means. He assumes that the shortest mode of arriving at perfect justice must be the best, and therefore takes for granted the existence of a virtuous despot or a purely reasonable democracy, as if such things were to be had for the asking. Undoubtedly short cuts to perfection are very tempting in every branch of speculation; but, if politics are ever to be made an experimental science, the first condition of successful inquiry must be to start from actual facts, and summarily to put aside as irrelevant all speculations which assume as their basis a state of things of the possibility of which we have no guarantee, and which all experience teaches us to reject as visionary.

MR. RUSKIN ON MR. RUSKIN.

MONTAIGNE begins his famous essay "Of Coaches" with Lucretius, and ends it with Atahualpa. But he is not more discursive than Mr. Ruskin, who ranges in a few pages of *Fora Clavigera* from Croydon to Assisi, and from his aunt at Perth to Ariadne in Naxos. Yet comparing Mr. Ruskin with Montaigne would at first sight appear like drawing a parallel between Socrates and the author of the maxim about men who have brains and no money. Mr. Ruskin has, however, in an eminent degree one of Montaigne's most prominent characteristics. He can interest a wide circle of readers in mere personal details. He can write long passages with no very apparent drift, yet be sure to be read to the end. He carries you back and forward in time, and up and down on the earth, at his will. Almost everybody disagrees with him. It matters little to him, though he sometimes refers to the fact with regret. He is, in one sense, as egotistical or self-satisfied as Montaigne. Mr. Ruskin uses himself, his peculiarities, his tastes, his misfortunes, his disappointments, his pleasures, his recollections, as the one never-failing source of illustration for whatever subject he may discuss. In this he has caught to a nicety the manner of the French essayist, and we have no fault to find with him for it. Mr. Ruskin is an interesting person, and sooner or later what he does will have to be recorded with care, and will form a subject for the writers of important books. It is well, therefore, that he gives us fragments of autobiography in his lifetime. Would that Mr. Mill had done the same! But Montaigne apart from his essays was nobody. He cannot have felt in his lifetime that the account

he gives of himself would ever be very interesting to any one except as illustrating the matter in hand. With Mr. Ruskin it is different. He is already a man of sufficient mark to make it a subject of considerable interest to a large circle to know whether he takes sugar in his tea or likes cats. He must be quite aware of this. We cannot tell whether *Fors Clavigera* has a wide circulation, and is a great success, commercially; indeed, we more than suspect, and Mr. Ruskin all but tells us, that it is not. But it has a circulation, and a certain number of people take it and read it with avidity. Mr. Ruskin perhaps feels like the curate whose congregation on a wet Sunday amounted to two people, and who gave them his best sermon, feeling they were entitled to it for their zeal in braving the rain. But Mr. Ruskin's audience crave for personal knowledge of the object of their admiration. They wish to know all about his birth, parentage, and education. They desire information as to his fortune, and like to hear how his money is invested. They would pry into the origin of his family and inquire after his maternal grandfather. And the supply equals the demand. Mr. Ruskin is indulgent. He gives them, to use his own words, so much of autobiography as it seems to him desirable to write. *Fors Clavigera* is the acknowledged channel by which the appetite he has created is to be appeased; and we need make no apology for venturing to recall what he has so far made known, and for endeavouring to place these autobiographical notes in a chronological and regular order. They are scattered through the forty-six numbers which up to the present time have been published. They occur *à propos* of art, science, history, religion, and political economy. They are not dragged in, but seem to come naturally and as if by virtue of a fixed law. When at Christmas he laments the excessive infant mortality of our large towns, and quotes newspaper statistics to show the effects of employing women in factories, he incidentally informs us that his mother soothed his youthful slumbers with "Hush-a-bye, baby, upon the tree top"; and he adds a memory of the dawning intelligence which objected to a defective rhyme in the first two lines. So, too, when in August he copied a part of a fresco by Simon Memmi in the Duomo of Florence, he took occasion, as he described the King, the Pope, and the Emperor, to tell us that his maternal grandmother's inn bore the sign of the "Old King's Head." It is while lecturing squires that he informs us that his mother was a sailor's daughter, and his aunt a baker's wife. A year ago, writing of Sir Walter Scott's early training, he told us how he himself was taught to read; and, a month ago, he described the pleasure he derived from lingering in his aunt's bakehouse, and said he was reminded of it by the Sacristan's cell at Assisi. Mr. Ruskin talks constantly of himself, yet he is not selfish. His egotism is like the innocent egotism of a child which always supposes the whole world to be concerned in the sad story of a bruised elbow or a broken toy. We must all sympathize with the inevitable "least shade of shyness" which increasing prosperity drew between Hunter Street, Brunswick Square, and Market Street, Croydon; and we cannot but rejoice when the family goes again to visit the homely aunt, to walk "on Duppas Hill and on the heather of Addington."

Mr. Ruskin's father, he tells us in the tenth number of *Fors*, began business as a wine merchant with no capital and a considerable amount of debt bequeathed by his grandfather. He paid his debts and made money, and his son has written on the granite slab over his grave that he was an "entirely honest merchant." There is a charming passage about his travels through England with his father, the books he used to read, the pictures he used to see, and how early he discovered the political truth that it was better to live in a small house and have Warwick Castle to be astonished at than to live in Warwick Castle and have nothing to be astonished at. Indeed, he goes further in this connexion, for he adds that he is obliged to refuse many kind invitations to America because he could not, even for a couple of months, live in a country so miserable as to possess no castles. In his twenty-fourth letter we have an account of his surname. He does not like the look of it, he says, because, as he apprehends, it is only short for "Rough Skin" in the sense of "Pig-skin;" and he cannot find historical mention of any other form of the name, except in a place to which he has lost the reference, as that of the leading devil of four, Red-skin and Blue-skin, and he forgets the skins of the other two, who performed in a religious play of the fourteenth century. This derivation can hardly be taken seriously, but Mr. Ruskin gives no indication in the context of any intention of joking. If there is any doubt that Ruskin means "little Russ," or Russian, it may be derived from a diminutive of Ralph, innumerable forms of which exist. Mr. Ruskin's father had a taste for art, and as to his other relations, we read that, besides the baker's wife of whom we have spoken, he had an aunt married to a tanner; and that there used to be a greengrocer of his name in a small shop near the Crystal Palace. His maternal grandfather went to sea at Yarmouth, and was killed when two-and-thirty years of age "by trying to ride instead of walk into Croydon; he got his leg crushed by the horse against the wall, and died of the hurt's mortifying." He was engaged, as Mr. Ruskin believes, in the herring trade, but we are not told his name. He appears to have entertained the prevalent notions of his day as to matters of family discipline, for though he spoiled his two daughters when he was at home, he could not forgive any tendency to equivocation, and the future Mrs. Ruskin, having once told him a lie, was whipped with a bundle of new broom twigs; but we have the satisfaction of knowing that it did not hurt her, though she "thought a good deal of it." There is also an aunt of whom he

tells, in Letter X., that she lived in the town of Perth, gave him cold mutton on Sundays, but had a garden full of gooseberry bushes. What this last particular implies can only be known to those fortunate persons who have tasted gooseberries where they grow in perfection. If nightingales are only to be heard south of the Trent, gooseberries can only be eaten north of it. He adds:—"My mother, indeed, never went so far as my aunt, nor carried her religion down to the ninth or glacial circle of Holiness, by giving me cold dinner, and to this day I am apt to over-eat myself with Yorkshire pudding, in remembrance of the consolation it used to afford me at one o'clock. Good Friday also was partly 'inter-meddled,' as Chaucer would call it, with light and shade, because there were hot-cross buns at breakfast, though we had to go to church afterwards." Mr. Ruskin's recollections of Sunday do not appear to be of a pleasing character. He asserts that he lost the pleasure of three-sevenths of his life because of Sunday, that he always had a way of looking forward to things, and that a lurid shade was cast over the whole of Friday and Saturday by the horrible sense that Sunday was coming and inevitable.

He very early made up his mind on certain metaphysical questions. Before he was ten years old he had settled for himself responsibility and free will by jumping up and down an awkward turn of four steps, and considering whether it was likely that God knew whether he should jump only three or the whole four at a time. Having settled it in his mind that God knew quite well, though he did not, which he should do, and also whether he should fall or not in the course of the performance—though he was altogether responsible for taking care not to fall—he never troubled his head more on the matter. In another place he gives some description of what he calls strong associative fancy about words. When he was a child the word "crocodile" always seemed to him very terrific, and he would even hastily in any book turn a leaf in which it was printed with a capital C. He complains that no one told him that crocodile only meant "a creature that is afraid of crocuses," but he intends to buy in Paris an artificial crocodile, and to show it to the first lizard he meets in Italy, to see what it thinks of it.

With regard to money matters Mr. Ruskin is most explicit. He had, when he wrote Letter XVIII., fifteen thousand pounds in Bank Stock, for which he got seven per cent.; but this particular source of income seems to cause him some uneasiness, as he feels sure it represents usury, and the Directors never ask his advice as to their investments, or solicit his superintendence of their affairs. Mr. Ruskin in the Bank parlour is a frightful vision, although he seems able to manage his house property at Greenwich on intelligible principles, and complains just like anybody else at the lawyer's delays in selling some houses. As to his disposal of his income he is equally open. He not only speaks of his seven thousand a year, but tells what he would like to do with it. We really feel a certain hesitation when we come to these pages. He complains that the Americans will not sell him a black girl, and mentions his wish to buy a white one with a title. No doubt he can obtain many if he goes the right way about it; but he seems to think he has not money enough left after he has fulfilled charitable obligations, and "white girls," he reflects, "come dear, even when one buys them only like coals for fuel." He regrets that he did not live in the days of Joan of Arc, as he would have been willing to give more than ten thousand pounds for her, and would not have burnt her. Many other traits of character he gives us in these notes as to his disposal of money, and on the whole we can say little in disapproval, except of one passage, which is certainly demoralizing according to our modern lights. He dare not, he says, give a penny to a beggar unless he is sure no clergyman is in sight.

We have no intention of sneering at *Fors Clavigera*, but it is impossible to judge of Mr. Ruskin on ordinary grounds of criticism, literary or moral. He takes up a position wholly outside the pale of everyday thought. Much of what he says is interesting only because he says it. Many of the anecdotes are important only as betraying the bent of his mind. Whole pages are occupied with disquisitions which have no bearing on any question but that of Mr. Ruskin's standing as an English writer. On the other hand, there are passages full of poetry, of philosophy, of religion, and of art, passages such as no other living author could compose, eloquent and full of meaning, stirring men up to exertion, raising them above sordid considerations, brightening their hopes, and guiding their aspirations. Then, suddenly, comes some remark so exceedingly trivial, or some piece of political or social economy so exceedingly visionary, that the whole of what goes with it is murred and tainted. It is often difficult, and sometimes impossible, to see why discordant notes are introduced into the piece. It is not easy to say what purpose is served by recording that Mr. Ruskin likes to have two servants with him when he travels, that he is fond of a dish of game, that he eats strawberries and cream with pleasure, that he once learnt twenty-six chapters of the Bible, and that he contemplates the use of a hair shirt with disfavour. Many people who admire or wonder at his writings will like to know that Mr. Ruskin is fifty-five years of age, that he eats his breakfast skulkily when correcting final proof sheets, and is not able to correct them at all within hearing of a steam whistle or within sight of a rainbow. But it is a question how far he is right in gratifying this kind of curiosity. He ministers to a depraved taste in doing so. People are self-conscious enough, and meddling enough, at the present day, without encouragement from one who assumes to teach everybody. He tells us that he has endeavoured in vain to

read a sensational novel on strikes; that when an old woman sold oranges at three a penny he gave her a penny a piece; that gas makes his headache, a peculiarity which he shares with all Londoners, we suspect; he declares himself to be misunderstood, which we do not doubt; to be ill-tempered; to have few early friends remaining; to be discouraged and disappointed. His servants make him enormous fires on warm days, and he is unable to persuade his cook to concoct the famous goose pie after the old recipe, "written purely from practice and dedicated to the Hon. Lady Elizabeth Warburton," in 1791; one day she wants a new oven, another day she has conscientious scruples as to the extravagance of the pie, and a third she does not feel well enough to undertake it at all. So much the better for Mr. Ruskin's digestion, as any one will agree who reads the prescription given in the twenty-fifth number of *Fora*. Mr. Ruskin is also greatly exercised because Messrs. Howell and James sent him circulars about silks which they have to sell at an alarming sacrifice; because penny cookery-books come to him by post, and, above all, because an old friend asks him to read a text every morning in what he calls a Sausage-book. In the eleventh letter he gives a full account of his residence at Denmark Hill, including a statement of the rent he paid, the number of men he employed, the shrubs he grew, and the azaleas he presented to young ladies. He tells his readers several things about his character too, some of which they could hardly have guessed; but one such note deserves, from its wholly unexpected nature, particular observation. In the number of *Fora Clavigera* which opened the present year we read that Mr. Ruskin considers himself a very different person from what most people, even of his friends and admirers, would suppose. His great difficulty—these are his own words—of late, whether in lecturing or in writing, is in the intensely practical and matter-of-fact character of his own mind, as opposed to the loquacious and speculative disposition, not only of the British public, but of all his former friends.

THE LESSON OF THE REGENT'S PARK EXPLOSION.

NOW that the inquest on the three men who were killed by the explosion on board the *Tilbury* in the Regent's Canal is concluded, and that the materials for a complete review of all the circumstances of the case are before us, it may be worth while to draw some practical lessons from the occurrence, and to consider in what manner London and other towns may be best preserved from a repetition of the disaster.

As to the cause of the accident, there is no reason to doubt that the verdict of the jury is correct. A strong chain of circumstantial evidence enabled the fact to be brought out very clearly that a few moments before the great explosion, there had occurred in the cabin of the *Tilbury* a sort of modified explosion or rapid burst of blue flame, not at all resembling an explosion of gunpowder. This, it was explained and experimentally demonstrated, was without doubt due to the ignition, by the lamp or fire which were proved to have been present in the cabin, of some vapour which, having escaped from a leaky or defective cask of benzoline—deposited by the care and foresight of the Grand Junction Canal Company among the powder—had percolated through the air-holes in the bulkhead separating the cabin from the stowage space. The fire thus established rapidly communicated with the cargo, the benzoline vapour acting as a "flame carrier," and exploded the powder. This explanation of the accident can hardly fail to commend itself to the acceptance of every one who takes the trouble to read the evidence, and it would be mere waste of time to set forth in detail the various points and proofs upon which it rests. It is more profitable to turn from this particular accident and its cause to the general question of the carriage of explosives through populous places, a point upon which the facts which were elicited at the inquest have thrown a great deal of unpleasant light. In the first place, it was very frankly stated by the Traffic Manager of the Grand Junction Canal Company that, if they are to carry gunpowder and benzoline at all, it is inevitable that these articles should frequently travel in the same boats; and on a subsequent occasion he stated, with equal frankness, that it was inevitable that the boats carrying the gunpowder and the benzoline should also have fires and lights on board. In the second place, we have the evidence of a petroleum merchant that the leakage or evaporation of benzoline and similar volatile substances forms an appreciable and recognized annual loss in the trade; and this evidence was strongly confirmed by that of Mr. Keates and Dr. Taylor, who both testified to the almost impossibility of preventing the escape, even at natural temperatures, of the volatile vapour from packages containing benzoline. In the third place, we have the undisputed and indisputable evidence of the scientific witnesses, and the more palpable evidence of ocular demonstration, that this vapour is of a highly inflammable character, that when diluted with certain proportions of atmospheric air it forms an explosive mixture, and that it can be ignited at "an indefinite distance" from the source of supply. This being the case, it seems to follow, on the authority of the Traffic Manager of the Grand Junction Canal Company, that every Canal Company which undertakes the transport of gunpowder and benzoline necessarily and unfailingly does so under conditions which may at any moment cause an explosion, and which in course of time must almost inevitably do so. This point being established, it is interesting to turn to the statistics of this trade. In reply to some questions by Major Majendie it was

elicited that the Grand Junction Canal Company alone had carried from the City Basin along the Regent's Canal in the three months preceding the explosion about two hundred and thirty-three tons of gunpowder, the consignments varying from nine tons downwards; and during this period about one boat per diem was despatched carrying benzoline, naphtha, and "things of that sort" with the powder. As these boats had also fires and lights on board, we arrive at the comfortable conclusion that the Grand Junction Canal Company have maintained a well-appointed and extremely efficient daily torpedo service through the Regent's and Junction Canals, which service, it seems, is only temporarily suspended in deference to the present unreasonable ebullition of public feeling, and which, it would appear from Mr. Hughes's evidence, will be resumed as soon as people have come to their senses again, and have ceased to take a stupid exception to a practice, simply because it has for once unfortunately chanced to give rise to some inconvenience. But the fact that the Grand Junction Company has made this temporary concession to popular clamour affords no guarantee that the traffic will not continue to be carried on with increased activity by other Companies, one of which at any rate, if we may judge from some recent proceedings in Bow Street, is well qualified to take the place of the Grand Junction Company in this business; and if the torpedo boat does not start daily from the City Basin, we see no reason to doubt that, weather permitting, it will take its departure quite regularly from some of the other wharfs in the metropolis.

It is not uninteresting to consider some of the other details of management of the London gunpowder traffic as revealed by successive witnesses at the inquest. The lamps which are provided by the Grand Junction Company for the cabins of their torpedo boats are unprovided with a shade of any description; but it is fair to observe that the Company do not bind their bargemen to the use of any particular pattern of lamp, and would therefore perhaps not absolutely forbid a glass shade if the "captain" of a barge chose to provide one. Naked candles also are not contrary to the regulations. The boats themselves are not specially fitted or furnished for the carriage of gunpowder. The metal work is of exposed iron, and no precautions are taken by the laying down of cloths under the powder-barrels to prevent contact of grains of escaped powder with the iron and grit. In the case of the *Tilbury* it seems from Dr. Taylor's evidence that special care had been taken to provide an efficient means of igniting the gunpowder by friction in the shape of sheets of emery-paper. The casks "are sometimes bad," and when the powder escapes it is gathered up and shovelled into the cask again, forming a pleasant mixture of gunpowder and grit for subsequent introduction into a magazine. No precautions are taken to prevent the bargemen who are stowing the powder from having matches in their pockets—"we don't trouble much about that." They wear their ordinary iron-shod, gritty boots while stowing the powder, there is no order against having fires on board while loading gunpowder, and the adjoining boats may equally have their fires alight at this time; indeed, as no one seems to know much of what is on his boat or his neighbours', it is quite clear that no orders upon this point could very well be attended to. The business of loading is carried on at crowded wharfs in densely populated parts of London, as at the City Basin and elsewhere. All attempts to obtain from the witnesses a statement as to any single precaution which was taken or directed to be taken with gunpowder specially—for which, by the way, an extra rate of about one hundred per cent. seems to have been charged—failed signally. One witness made a feeble attempt to produce the impression that it was the practice to water the boats before putting powder on board, but he was promptly disposed of by the evidence of succeeding witnesses, who were quite emphatic as to the absence of any superfluous precaution of this sort; and there seemed to be no serious disposition to question the fact that gunpowder is habitually handled and despatched by the Grand Junction Canal Company exactly as if it were so much flour or soap. No notice even of the consignment is required from the powder manufacturers, so that an indefinite quantity of gunpowder may arrive at the wharf at any moment, and there lie among the other miscellaneous stores, or in the so-called "magazine" (which has been condemned by an officer of the Metropolitan Board of Works as wanting in every element that a magazine should possess), until a boat happens to be going to the particular place to which the powder is consigned. "The tarpaulins occasionally fly open," but the Company "have issued no special orders for the proper securing of tarpaulins." Such, on the evidence of their own officers and workpeople, are the conditions under which the gunpowder and benzoline traffic has hitherto been carried on in and through London by the Grand Junction Canal Company.

What prospect we have of any improvement in the business, when the Company resume the trade on the subsidence of the existing alarm, may be gathered from Mr. Hughes's statement, which he repeated on re-examination, that the Company "could not alter their system of carrying gunpowder, nor could they see any way to improve it or make it safer"—which there is too much reason to fear is only a sample of the state of things elsewhere. That such a state of things should exist, and that, being known to exist, it should be possible for it to continue for a single day, is, we do not hesitate to say, simply disgraceful. But it is now almost exactly ten years since the whole system of the transit of gunpowder and the absence of supervision and proper legislative precautions with regard to its transport were formally and strongly condemned by Colonel (now Major-General) Boxer. And yet during this lapse of time successive Governments

have done no more than nibble at the subject, or set officers to accumulate additional evidence as to the necessity for the amendment of the law relating to explosions. Whoever will take the trouble to refer back to certain papers on Gunpowder which were presented to Parliament in 1865 will there find the strong representation addressed to the Government of that day by the Coroner's jury on the Erith explosion as to the inadequacy of the existing law; he will find the subject carefully gone into by Colonel Boxer, and the dangers to which the public are exposed, especially in connexion with the transport of gunpowder, elaborately explained; he will find a number of miscellaneous reports all pointing in the same direction; and yet during these ten years this dangerous traffic has been allowed to continue, and no fresh statutory powers of supervision or regulation have been asked for—a neglect for which successive Governments must share the blame. It is not the least unsatisfactory part of the whole affair that the public alarm consequent on the Erith explosion, which was not less intense than the alarm that at present prevails, should have evaporated without producing any results; but perhaps the true explanation of this is the one suggested by Major Majendie in his Report of 1872, that while it has been to the interest of the trade to “let sleeping dogs lie,” the public “have since 1864 continually anticipated some revision of the Gunpowder Acts, and treated as imminent their promised amendment.” However this may be, it is beyond doubt that public opinion will now demand, and properly demand, the strict fulfilment of promises of legislative reform too long postponed; and the question arises what form should this action take specially in relation to the transit of gunpowder.

We come now to a consideration of the remedies to be applied. The favourite remedy at the present moment seems to be a complete annihilation of the powder-carrying trade, for practically that is what the proposition to forbid the carrying of gunpowder through London would amount to. As was pointed out by Major Majendie in his evidence on Monday last, if you stop the carrying through London, you must, to be consistent, “stop it all over England in towns and populous places, or between river banks and raised canals, where inundations would do terrible damage; and if you do that,” he added, “you strangle the trade.” A little consideration will serve to show that this must be so. There is no more reason for singling out London for entire immunity from this traffic than there would be for singling out Manchester, or Glasgow, or Leeds, or Birmingham. So that legislation which proceeds upon the principle of never allowing gunpowder to be where an explosion would cause serious damage would involve as one of its consequences the stoppage of all traffic in this article through every town in the kingdom. Obviously this is impracticable. Many of the large towns are directly nourished by industries, such as the iron and coal trades, which depend for their very existence upon gunpowder. It would be easy to multiply arguments to show that such a course as this would be absolutely impracticable.

It has been suggested that all places at which gunpowder above a certain quantity is loaded or unloaded should be registered or licensed, and that the Secretary of State or other authority should have power on cause shown to forbid the use of any wharf or place for this purpose altogether. But this power is one which would have to be very carefully guarded and very cautiously exercised, to prevent undue injury to a necessary and very important trade, and serious injury to individual traders; and in every case of this sort full opportunity should be given to the Companies concerned of showing that there is no other wharf or place away from any centre of population which they could substitute for the one objected to. But this modified power of interference in extreme cases is the nearest approach which we conceive would be admissible to the proposition to get rid of powder altogether from populous places. And, even with this power in operation, there is no doubt that the presence and passage of explosives in and through populous places would still remain the rule—the protected places would be the rare exception; and it is, we consider, essential that legislation with regard to the matter should be based upon the acceptance of this fact. The further fact must also be faced and accepted, that the amounts of powder from time to time present in and passing through populous places will, notwithstanding such regulations as may properly be applied for the minimizing of the quantity present at any one time or place, and notwithstanding such precautions as it may be practicable to enforce for localizing the effects of an explosion, be sufficient in the event of an accident to cause serious damage to life and property. And this brings us to the conclusion that the value of any legislation upon the subject must in the long run depend upon the extent to which that legislation is adequate to prevent accidents, rather than upon the extent to which it aims at limiting the effects of any possible accident. There is of course no reason why attention to the former of these principles should involve neglect of the latter; the two should go as far as possible hand in hand. But while the latter result can at best be only very partially and imperfectly accomplished, the prevention of accidents is a matter in which an approximation to an entirely successful result may be much more practically achieved, and that at a minimum of inconvenience and injury to the trade. We are, therefore, of opinion that legislative action in regard to explosives, while not ignoring the important question of the minimizing of the effects of possible accidents, should be mainly directed to the enforcement of proper precautions in the packing, handling, storing, and transport of the explosive materials.

Nor would these precautions need to be as numerous or difficult as is commonly supposed. In dealing with gunpowder pure and simple we have the confident and assured knowledge that it is free from the remotest liability to spontaneous ignition. Consequently, so long as you guard the powder from all external sources of danger, you have a perfect confidence that your cargo is *per se* no more dangerous than one of flour or soap. The first element in securing the safety of the powder is the provision of thoroughly good and sound packages. So long as powder is packed in cases which permit of no leakage—a very important source of danger—the risk of explosion by friction or by an accidental spark is disposed of. And we trust that no pains will be spared in forthcoming legislation to secure the uniform adoption of packages from which no escape of the powder shall be possible. A remarkable instance of the efficacy of a good case as a protection for powder against even formidable adjacent fire and explosion is afforded by the circumstance that several tin canisters containing powder were blown out of the *Tilbury* and afterwards recovered. Assuming that we have our powder in proper packages, we have next to consider its stowage in vehicles or vessels which are themselves free from elements of accident, and under conditions which will render the approach to it of fire in any form impossible. Here we touch upon the question of mixed cargoes; and most persons will probably agree that gunpowder should not be carried under any circumstances with miscellaneous cargoes of a highly inflammable character, and not even with miscellaneous cargoes of non-inflammable character, unless the powder be placed in a separate part of the vessel. The regulations should extend also to the forbidding of fire or smoking at certain times, and of any acts tending to cause accident; and regular powder huges ought, we should say, to be provided with lightning conductors. When these precautions have been taken, and when provision is made by an efficient system of local registration and inspection for the due observance of all the rules, all reasonable risks will be eliminated as far as the transport itself is concerned. The shipping and unshipping of the explosives are matters not so easily regulated, as each case would to a certain extent have to be considered on its merits in relation to local circumstances. This should be provided for, as recommended by the Select Committee on Explosives, by requiring such shipment to be carried on under by-laws to be approved by a central authority. Such, in outline, is the sort of form which legislation on this subject should take—temperate, well-considered statutory rules for the general regulation of the traffic, properly approved by-laws for the local regulation of the shipment or unshipment, and an efficient system of registration, inspection, and control. When these safeguards are adopted, the people who are now fleeing from their houses in the Regent's Park may venture to return to them; but until some such amended legislation is introduced, they will perhaps be acting more prudently in remaining away from them.

MUCH WENLOCK.

THE traditional schoolboy is no doubt well versed in the history of Shropshire. He knows the origin of the toast of “All friends round the Wrekin,” he knows the height of that hill, the name of the village that gave birth to Wycherley, and the age of Old Parr when he died. All this and still more he may have at his fingers' ends, but we venture to say that he knows nothing at all about the borough or the town of Much Wenlock. Members even of Brooks's and the Carlton are ignorant on this important subject. One man thinks the place is in Cornwall; another believes that it was disfranchised in 1832; while a third inveighs against it as a constituency which ought at least to have lost one member in 1867. As correct views should prevail, and as public attention will, for perhaps one day, be directed to Much Wenlock on the occasion of the vacancy in its representation, we propose to say a few words about it.

The first thing to do is to distinguish between the town and the borough. Before the existence of the line of railway connecting Wellington and Craven Arms, few towns were more out of the way, and the natural access was by a twelve miles' drive from Shrewsbury or Wellington. Yet, whatever might have been the difficulty of the journey, the traveller would have been repaid for his trouble. The town, numbering some 2,400 inhabitants, lies in a little hollow on the tableland which is reached by the ascent of Wenlock Edge, and is not visible from any side until it is almost reached. There are no straggling houses, all is grouped together—its two main streets in the form of a T, and the little station which might serve for a vicarage during the long intervals when no train is to be seen. Westward lie the parish church, rich in Norman as well as Perpendicular details, the ruins of the stately Abbey, the fifteenth-century uniformity of the Abbot's house with its double cloisters rearing its head above the fragments around it, and the gable of the southern transept which displays in its proportions work of the finest time in English architecture. At some future day we may perhaps say something about these remains, which early in this century served as the quarry from which all the building stone required in the repairs of the walls and cottages in the town was taken. Charming as the scene is now, the tourist of the past does not seem to have been always captivated by it. “It has,” says a writer of the town in 1769, “two ill-built streets, and, standing low, is so dirty that strangers by way

of derision call it Muck Wenlock." Dr. Johnson when he passed through it in 1774 called it "a very mean place, though a boro'." He probably cut his name in the chapter-house of the Abbey, and broke off a crocket by swinging his stick round; unless indeed the comforts of some among the innumerable public-houses which, judging from present analogy, must have existed at that time, proved too strong for him and kept him indoors. Once Wenlock was great in affording facilities for drinking beer. It was said that the answer to a newly appointed vicar who inquired whether the water was good was to the effect that the oldest inhabitant had never tasted it. One of these veterans, on being asked whether the story could be true that a German had drunk ninety measures of ale in one day, replied that he hardly knew, but that certainly eighty-four might be drunk, which conclusively proved the possibility of the accomplishment of the German feat. Those days are however passed, and there are now sad gaps in what once presented an unbroken line of beer-shops and taverns. The houses have been so frequently repaired and altered that the archaeologist could rarely guess their age. Sometimes a seventeenth-century date is seen between two windows of the Georgian era, and a sleek plastered house ends in a huge chimney carried up externally, probably coeval with the Abbey. Here and there stand what once were manor-houses of some repute, but now fallen from their old estate and converted into shops. One bearing the date of 1681 has a quaint balcony with spiral columns between its two projecting gables, though whether it was intended for ornament only or as a kind of *tinghiera* is not very evident. Another old house has a stone arched gateway, and is no doubt of early sixteenth-century work. The town is full of mediæval relics, of wells with saintly names and holy memories, built like miniature crypts in days when stonemasons did not grudge their work, and nothing was so mean as not to admit of beauty. In all the glories, however, of the nineteenth century Wenlock has but little share. Much or Great she can only be called in contradistinction to Little Wenlock, which nestles at the south-eastern foot of the Wrekin. Famous she may be, as in Camden's time, for limestone, but neither trade, nor railway, nor a National School, nor telegraphy has increased her population during the last decade. There have been but few tourists since M. Jorevin de Rochefort's visit in 1672, who was a good deal troubled by the nomenclature of the place, and registered it at last as *Menchoueniat*—at least this is the only possible interpretation we can suggest of this eccentric spelling. The engine puffs once or twice a day, but it conveys no passengers. There is no noise, no hurry, no confusion. Never do to-day what you can do to-morrow, and never do yourself what you can get any one else to do for you—such is the little town's motto, as she tries to remember that Henry VIII. is dead, and that the monastery is dissolved. But with the dissolution went her real reason for existence, and she must submit to be spoken of by Murray "as now little more than a village." She belongs to the past, to be outstripped in the race of life as much as the fossils in the primary rocks around her. Americans often complain that in our zeal for improvement and our democratic rage we shall leave them no quiet place to take refuge in; we can, however, safely promise that centuries will succeed one another without disturbing the repose and the beauty of Wenlock, and that with "Clunford and Clunbury, Clugunford and Clun," she will long boast of being one of the "quietest places under the sun." She must not, however, be exposed to the harassing cares of two elections within the year, to public addresses, and such like; otherwise a taste for knowledge will creep in, a gazette or a journal will be established, and her privacy destroyed.

But it is time that we should turn to the borough, which has a population of more than 21,000, and numbers 3,541 electors upon the present register. The borough is a county in extent, and is nearly identical with the ancient possessions of the Abbey. The Severn divides it roughly into two equal parts as regards population—the part which lies on the right bank numbering 1,711 voters, the majority of whom are occupied in agricultural pursuits, and present a strong contrast to the inhabitants of Coalbrookdale, of Ironbridge, and of Madeley, who are chiefly engaged in the coal and iron trades. To give a description of the constituent parts of the borough would be to write a history of South Shropshire. The polling district of Much Wenlock includes secluded villages in Apedale, nine miles distant, whence comes an array of agricultural labourers whose political opinions are not much unlike those of Wilfred Galskistone, who, it will be recollected, fell at Proud Preston fighting with great bravery, though he was never able exactly to understand the cause of the quarrel, and did not uniformly remember on which King's side he was engaged. From Apedale the canvasser will make his way to the more outlying parts of the borough across Wenlock Edge, a long range of hills which runs from Buildwas in a south-westerly direction, a distance of over fifteen miles. Few districts were wilder than this fifty years ago, and crags project from its terrace where ravens not long since built their nests. There is little in the brushwood which clothes its banks to recall its existence as part of the Long Forest, though here and there an oak remains to attest its former magnificence. We know hardly any view in England of so great beauty and interest as that from any point along the northern extremity of Wenlock Edge. On the north is the Wrekin, which, in spite of its conical and unmajestic outline, possesses a kind of literary sentiment and personal attraction which many a hill that is far higher is quite without. To the west, Shrewsbury, "inlaid" by the Severn, is seen, and beyond the far range of Welsh

hills, running up behind Chirk into Flintshire. A little to the left are the lovely slopes of Acton Burnell Park, and in the distance Loton, at the foot of the Broidden; while to the south lies the valley of Apedale, sheltered by hills known best to Drayton and Sir Frederick Murchison, and sadly neglected during the interval which elapsed between these two writers. On the east, some ten miles distant, are those "loving twins" the Clees—the higher of the two, the Brown Clea, rising to a height of more than eighteen hundred feet. On its northern slope is situated the village of Ditton Priors, recently made a polling district, and including for that purpose the villages of Stoke St. Milborough and Monkhepton. Here are goodly fellowships of farmers, influenced more by personal than political considerations, to whom a change of temperature is more important than the fall of Cabinets, and whose mode of life has not been materially altered by the Irish Bills of '70 and '71. Nature never intended that the slopes of the Brown Clea should enjoy the blessings of the franchise. Beautiful as are the gullies and ravines which separate farm from farm, they are serious obstacles in the way of canvassing. The tenants are never at home, and are probably pointed out to the candidate ploughing in some field a mile off, to which there is no road, and between which and himself flow becks of various sizes over which there are no bridges. There are, however, two hundred voters in the polling district, who, we imagine, could hardly communicate with one another or the outside world by means of the Post Office under a week, and to whom therefore the fact of the existence of a contest should be made known orally. With the remaining polling districts the public is probably more conversant. Broseley, Madeley, Ironbridge, and Coalbrookdale are all centres of some commercial activity. Three of these have their attendant hamlets, and Coalbrookdale has Little Wenlock attached to it, a village which does not require its prefix to add to its perfect obscurity. The character of the country on the left, or English, side of the Severn presents a striking difference to that which we have been describing. The banks rise rapidly and precipitously from the river; the houses are perched one above another like those in some Italian village, though, with the exception of Madeley Court, there are no buildings which date back more than a century. The population is employed in the iron works of the Dale, in mining, and in the china works at Coalport. For a distance of some three miles down the river the refuse of abandoned pits is visible on all sides, and the traveller might almost fancy that he was in an advanced outpost of the Black Country. But after Coalport is passed woods again clothe the banks, receding to some distance from the river, when Apley Terrace is reached, where the red sandstone crags and glorious timber add a special feature to one of the most beautiful of English parks.

It is in Madeley that the chief interest in politics centres. Coal and iron rapidly familiarize men with the most prominent questions of the day, and opinions of some kind or other are sure to be held with regard to them. Capital and labour here have had their disputes, which as yet the agricultural interest has been able to avoid. Political crochets do not abound; wandering fanatics have never made the borough a base for their operations—not, we dare say, from any want of will on their part, but from a complete ignorance of its existence. The curious obscurity of the borough must not be lost sight of in discussing it, and yet, owing to the special enactments by which it has been excepted from legislation, sufficient trouble has been given to cause it to be remembered. If it only had some salient historical incident to boast of, if Charles II. would only have climbed an oak in Shirlet Forest instead of at Boscobel, all would yet be well. Men fought at Worcester, at Bridgnorth, at Craven Arms, and Shrewsbury, yet no skirmish of importance seems to have taken place in a constituency which extends over more than thirty thousand acres. No murder of peculiar atrocity has been committed, no saline spring has been discovered, and the reversal of Dr. Johnson's sweeping criticism must be trusted to time alone. With regard to the political history of the borough there is not much to be said. In the old descriptions of Parliamentary property the borough was entered as belonging to Lord Forester and Sir Watkin Wynn, the latter of whom sold his Wenlock estate in the year 1858. In the election of 1832 an attempt was made to return a Liberal; 635 electors voted; Mr. Bridges polled 307 votes, the late Mr. Milnes Gaskell received 330, General Forester obtaining 447. In 1835 Sir William Somerville contested the seat, but polled 99 votes less than Mr. Milnes Gaskell. After this no contest took place, and no change in the representation of the constituency until 1868, when Mr. Milnes Gaskell retired, and Mr. Brown obtained the vacant seat as a Liberal. In the election of last February General Forester and Mr. Brown were returned, the independent Liberal only polling some 800 votes. By the death of Lord Forester a fortnight ago, General Forester has succeeded to his brother's title, and a representative career of forty-six years has come to an end. In the absence of other data, future compilers of history might imagine that so long a tenure of power must have enabled its possessor to have influenced in no slight degree public opinion and to have left his mark upon contemporary politics. What advantages so long an insight into Parliamentary usages should give! What generalizations might be prompted by witnessing the fall of so many Governments! What might not dogged perseverance alone have effected? A sense of the shortness of life prevents many men from undertaking schemes which they cannot expect to carry into effect. If, rising year after year, General Forester had devoted himself to the attainment of any one object,

of any chimera, however wild, what might not the House of Commons have granted at the expiration of his annual motion in his forty-sixth Session? Peace, however, to General Forester's Parliamentary ashes! He belongs to other days, which we have no wish to criticize. If it was a time when a member of Parliament gave but little, little was required from him; and if men thought crudely, or ill, or not at all, they at least contentedly acquiesced in an aristocracy of speech.

We feel now that we have given as much information about Wenlock as the ill-prepared mind of the public can digest at one meal. The contest which is at present proceeding will enable the reader to continue his studies; it is one which fulfils all the conditions essential to the ideal contest. It is a fight between Whig and Tory, and belongs to pre-Reform Bill days. Lord Forester has by far the largest acreage in the borough, but Lord Wenlock stands next. The first is represented by his nephew, the latter by his son. The one will make "the consolidation of the Liberal party" his first object; the other will give a general support to the present Government. There is but one seat, there are no side issues, no elaborate computation of split votes. The lookers-on have nothing to divert their attention. We confess to a satisfaction in seeing the two largest landed proprietors fighting out a political fight. It is a relief for once to be without the ex-mayor, the provincial newspaper editor, or the tramp with his local dialect and vestry-complexioned mind. In the days when Lord Liverpool was Consul such a contest as this would have burdened the Willey and Bourton estates with a special mortgage for the occasion. Politicians of the past may indeed take comfort in the thought that Wenlock is among the few boroughs which enjoy the proud privilege of conveying voters to the poll, but, even with the happy addition of this item, the expenses of both candidates cannot exceed a few thousand pounds.

SACERDOTALISM.

IT has been observed that, if disputants would only give themselves the trouble to define their terms, more than half the controversies in the world would at once be settled, while the remainder would be seen to involve differences too fundamental to admit of adjustment. Disputes are in most cases interminable because neither party understands clearly either his opponent or himself. It is the way of boys to be inaccurate, and no blame to them; but the majority of men in some respects remain boys all their lives. Take, for instance, an argument in a debating society as to whether slavery is consistent with Christianity. Nine-tenths of the speakers will have no exact idea of what they mean by slavery, still less of what they mean by Christianity; and most of them will be almost equally vague in their use of the connecting term, "consistent." The reasoner who was brought to explain that, when he said "religion," he meant "the Church of England," was so far definite enough, but then his explanation of the underlying and not very obvious sense in which he used a word open to many other interpretations was only elicited by gradual stages, under severe pressure of Socratic cross-examination. Many of our readers will be familiar with the inimitable description of young Mr. Brown's matriculation in Dr. Newman's *Lectures on University Subjects*, which admirably illustrates our point, but is much too long to be quoted here. The habit of translation from one's own language into another, or *vice versa*, especially if it be a dead language, is perhaps one of the best correctives of this fatal inaccuracy of thought. The fact that so few Greek or Latin terms convey precisely the same meaning as their English synonyms, when they happen to have one, is in itself a salutary lesson in the careful use of words. And what is true of disputes in general is pre-eminently true of theological disputes, four-fifths of which have been declared by a high authority to consist of misunderstandings and logomachies.

There is no term to which these remarks are more strictly applicable than one which has been in everybody's mouth and on everybody's pen for the last six months or more. We mean the word "sacerdotalism." It needs but a cursory glance at the various speeches and articles in which it has figured so conspicuously to be convinced that, like the term "Ritualism," it is employed in at least half-a-dozen different senses, sometimes by the same speaker; while many of those who are so glib in their denunciations have evidently never condescended to reflect whether it has any meaning at all. It is rather less offensive and considerably more vague than the older term "priestcraft," for which it has been made to do duty in recent controversy. And, like priestcraft, it is never employed except with a more or less opprobrious intention. Of the two leading significations attached to it, and inextricably confounded in popular phraseology, everybody would disclaim the one as a description of his own views, while those who accept the other would call it by a different name. "Sacerdotalism" and "sacramentalism" are related to each other very much in the same way as "deist" and "theist." To call a man a deist is to charge him with rejecting Revelation; to call him a theist is to assert his belief in a Personal God. The same fact is in either case alleged, but it is viewed under a different aspect. And, in like manner, those who attribute a mysterious efficacy to sacraments would probably not object to be styled sacramentalists; but to stigmatize them as "sacerdotalists" is to fix attention exclusively on the circumstance that they ascribe that efficacy to sacraments administered by them-

selves, or by the order which they favour, if they do not personally belong to it. Often, of course, a great deal more than this is meant to be conveyed, but we are here dealing with the term in its least obnoxious application. There is therefore at best a certain unfairness about it; but an unfairness which seems to be found practically inseparable from religious controversy. To give a bad name to a dog which terrifies or offends you is rather like fighting with poisoned arrows, but the temptation generally proves irresistible. The early Christians were called "atheists"; Tories were at one period "the malignants," at another "the stupid party"; High Churchmen have had successively four or five sobriquets—all on various grounds more or less offensive—during the last forty years, and the latest of them is "Sacerdotalist." Perhaps it may console them to reflect that, according to the more commonly received view, the disciples were first called Christians, not by themselves, but by their opponents.

We should be loth to charge so respectable an authority as Lord Coleridge with confusion of thought, and it is certain that he is incapable of intentional unfairness. But it must be allowed that in his recent speech at Exeter he has not kept as clear as could be desired of the prevalent vagueness of phraseology on this subject. After dwelling at some length on the Public Worship Act and on Mr. Gladstone's article on Ritualism, he proceeds to observe that what is at the bottom of the controversy, and causes its tension and bitterness, is the conviction avowed on both sides that "the one great doctrine" at stake "is what may be termed the sacerdotal principle." When we first read this passage, we seemed to ourselves to be hailing the first gleam of daylight on a subject almost hopelessly obscured by words without knowledge. It would have been very interesting, whether we were eventually able to agree with him or not, to learn from a man of Lord Coleridge's eminence what, in his opinion, "the sacerdotal principle" really is. But we were doomed to speedy and complete disappointment. Without a word of explanation the speaker goes on to say that, while he himself delights in magnificent architecture and splendid ritual (which many persons think very sacerdotal) as most useful aids to devotion, he yet had rather worship in the barest possible barn and with the meanest ceremonial "without this sacerdotal principle" than in the noblest cathedral with it. Be it so, but still what is "this principle"? We are next informed that the Church of England is a legal institution, and has certain legal documents, comprised in the Prayer Book, "by which every one of its members is bound," and that no one with a fair and candid mind can doubt that in several parts of these documents "there is to be found this sacerdotal principle," by which therefore, on his own showing, Lord Coleridge must be himself bound. This looked still more perplexing; but as he refers specifically to the Ordination, Visitation, and Communion Services, we can hardly be wrong in understanding the sacerdotal principle here to mean pretty much what we just now called sacramentalism. The next sentence indeed puts this beyond a doubt, for it speaks of the "startling" language about Confession and the Eucharist used by several of the Reformers, and even by Manton, chaplain to Oliver Cromwell. He finally draws the very natural and just inference that those who take their stand on these documents, and maintain the opinions which they do maintain—meaning, if we rightly understand him, sacerdotalism—have a perfect right to do so. It would almost seem indeed to follow from what he said before that they are bound to do so. So far, if Lord Coleridge's view is not very explicitly drawn out, it is tolerably intelligible and consistent. Personally he dislikes "sacerdotalism" extremely, though he is very partial to some of its ordinary adjuncts, but it is unmistakably taught by the Prayer Book and by the most "thoroughly Protestant" of the Reformers, and therefore all who are bound by the Prayer Book have a perfect right to teach it. But then, all of a sudden, he turns round and presents the other side of the picture to our view. Anybody who can read the signs of the times must perceive that "at this time of day men will not submit to sacerdotalism from anybody whatsoever." Again no explanation of the term is vouchsafed to us, and in view of the wide influence still exercised by the Roman Catholic Church, to say nothing of the Orthodox Eastern, and the "sacerdotal" section of the English Church, this statement rather puzzled us. Nor is it very clear what the signs of the times and the spirit of the age can have to do with the truth or falsehood of sacramental doctrines. But a "closing observation" is subjoined, which does help to solve our difficulty, only by showing—what we implied just now—that Lord Coleridge has fallen into what logicians call "the fallacy of undistributed middle," using a term in one sense in his premises and in another in his conclusion. The clergy, he tells us, have, and deserve to have, the greatest amount of influence of any class of men in the kingdom, but they will not preserve it "unless they cease to grasp at power, for power is one thing and influence is something totally different." From which we are compelled to infer that sacerdotalism here means grasping at power. No doubt the present age is very little disposed to listen to the pretensions of Hildebrand, but sacerdotalism of that kind "is something totally different," to adopt Lord Coleridge's phrase, from the sacerdotalism taught in the Prayer Book, and he need hardly retire to worship in a barn in order to escape its inroads. It is this equivocal use of what may be called burning words—words which are potent to fan the religious passions of the multitude into a flame—that we deprecate. And we complain of it the more in a speaker of the high distinction and well-deserved influence of Lord Coleridge; though we were not at all surprised to

find the *Times* reckoning it a chief merit of his speech that "he does not attempt to define the meaning of the term." Nor can it be said that the various correspondents of the *Times* who have commented on this speech have done very much to enlighten us. There is a vagueness about Mr. Llewelyn Davies's oracular statement that sacerdotalism is "not a theory but a habit of mind"—namely, "the habit of substituting the visible for the invisible, the audible for the inaudible, the carnal for the spiritual." Still less can be learnt from Mr. Voysey's passionate appeal to the "abhorrence" of Englishmen for "Ritualism, Romanism, Priestcraft, and Sacerdotalism." And Mr. Blomfield's more precise definition of "the essence of the theory," which he explains to be "that the earthly minister is a mediator between God and man, *without whose intervention man cannot be saved*," labours under the grave practical disadvantage of enunciating a "theory" which no sane man dreams of maintaining.

There is of course one, and only one, plausible reply to these remarks. Sacerdotalism, it may be argued, whether taken in the sense of sacramental belief, or in the broader sense of priestcraft—that is, lust of priestly power—is simply the same idea viewed under different aspects; sacramental doctrine is maintained, as it was first invented, for the exaltation of a priestly caste, and those who believe, or affect to believe, in the one are sure to be aiming at the other. There are many persons ignorant or malicious enough to say all this, and there are a great many more only too ready to believe them. The answer is very simple, and is happily quite independent of the theological bearings of the controversy. Sacerdotalism in its Hildebrandine sense, which in modern parlance would be more appropriately designated Ultramontaniam, has, or certainly had, its good side; and impartial students of history will probably acquiesce in the conclusion arrived at by leading critics of very opposite schools, that, in the long and complicated mediæval struggle between the *Sacerdotium* and the *Imperium*, the former was on the whole more largely and more often in the right. But the social and political conditions of our own day are totally different, and those claims of mediæval sacerdotalism are manifestly out of date. Not so however sacramentalism, which, whatever may be its theological merits or demerits, must obviously be just as true or just as untrue in one age as in another. It has nothing to do with that particular aspect of the Church of Rome, touched upon in the paragraph of Mr. Gladstone's recent article, which has kindled Catholic Ireland into a blaze; indeed it has no exclusive connexion with the Church of Rome at all. Sacerdotalism in this sense is at least as rigidly maintained by the Orthodox Eastern Church, and the various Nestorian and other heterodox bodies which have broken off from it—such as that, whichever it be, presided over by the "Patriarch of Antioch" who occupied so prominent a place at the Brighton Church Congress—as by the Roman Church herself. It is equally maintained by the Irvingites, and we believe by the Moravians. Yet none of these communities are usually reproached with hierarchical ambition, or supposed to excite the sort of hostile and suspicious feeling to which Lord Coleridge ascribes the passing of the Public Worship Act. We end therefore, as we began, with insisting that the word sacerdotalism, like other "isms" freely bandied about in controversy, requires to be more accurately defined. And we will add that, while in this, as in many other cases, more accurate definition might go far to bring the controversy to a close, until some fixed sense of the term is generally agreed upon, the sooner it is banished from polemical use the better.

TRÈVES.

AN observant traveller is always finding fresh occasion to ask himself why everybody goes to one place and nobody goes to another which he finds far more interesting; and nothing is more likely to occasion such a question than a visit to Trèves. Few places can have more striking historical associations; for it is the oldest city in Germany and was once the greatest city in Gaul; it is full of superb remains of its Roman grandeur; it lies in a charmingly pretty country, with all sorts of delightful walks and excursions hard by. Yet nobody goes to it. If our countrymen are in a hurry to reach their beloved Alps, they go straight by Dijon to Geneva, Basle, or Neuchâtel; if they are newwangled tourists, who desire to fulfil all the righteousness of a tourist, they ascend the Rhine from Bonn in a crowded steamboat. Some few have of late years taken the route of the Great Luxembourg Railway, *via* Luxembourg and Saarbrücken, but, as Trèves lies a mile or two off this line, they do not see it; and scarcely any one thinks of turning aside to examine the oldest, and in some respects still the grandest, of the Rhineland cities. Still less, of course, do Americans resort thither; and though the proportion of native German visitors is larger, it is much smaller than one would have been prepared to expect, for the modern German's holiday is almost always taken at a Bad, or, if not, then in the Alps or Welschland; and he has not much more interest in the antiquities of his country than the average Englishman.

By way of excuse for such ignorance in this instance, it must be admitted that Trèves has now for a long time allowed herself to be forgotten by the active world. She fell out of the line of great and powerful cities earlier than most of those Roman towns which have continued to be cities at all. Lyons and Bordeaux, however inferior now to Paris, did not yield to her till the end of the middle ages, and have grown absolutely, if they have declined

relatively. The stately Vindonissa, on the other hand, has perished utterly; and the other Roman Rhine towns, such as Coblenz, Strasburg, and Basle, were not really considerable until well down in the middle ages. Trèves, however, never fully recovered from the Germanic invasions of the fifth century; or rather perhaps we ought to say that, when she was fast recovering, rival cities arose whose more fortunate position enabled them to outstrip her in the race. In the eleventh and twelfth centuries trade began to revive, and the Rhine was of course its great highway, as rivers must necessarily be in an unsettled state of society. Now Trèves lay too far from the Rhine to benefit by the commerce that flowed along it as did Strasburg, Worms, Mentz, and Cologne; while her own Moselle, which was not only a much less easily navigable stream, but, so to speak, led nowhere, was not fitted to become a commercial route. Trèves moreover never managed to grow into a self-governing municipal community, like so many other West German sisters. Ever since the departure of the Emperor and his lieutenants, the greatest man in the city was the Bishop; and by the twelfth century he had become far too potent to be restrained by the strength of the commonalty. The same thing, to be sure, happened in Mentz and Cologne. But Mentz and Cologne lay upon the great river, in the main track of commerce; and though the former city could never succeed in throwing off the yoke of the Bishop, while the latter had eventually to submit to him, the greatness of neither seriously suffered. Mentz indeed, as the ecclesiastical capital of all Germany, was probably greater even as the patrimony of a prelate than she would have been had she remained the centre of the league of the free cities of Western Germany, while Cologne drew almost as much gain from those who flocked to her sacred shrines as from the merchant ships that thronged the Rhine wharfs. Never since the days of Constantine and Julian has Trèves had an historical part to play comparable to that of the two other great archiepiscopal seats; and even in the long line of her prelates we find no names to compare with some of those which they furnish—no saint like Boniface, no statesman like Anno. Nevertheless it was only to Mentz that Trèves yielded precedence; and the title which her Bishop bore, of Archchancellor of Gaul and the kingdom of Arles, recalled down till the Peace of Lunéville the days when she had been the residence of the heads of the world, the proudest seat of power on this side of the Alps. As an ecclesiastical city, the capital not only of an ecclesiastical province, but in later days of a large and wealthy principality, Trèves was from the fourteenth to the eighteenth century a place of consequence; yet even this was waning before the fatal blow came; for in 1786 Clement Wenceslas, the last Elector Archbishop, removed his residence to Coblenz. Eight years later came the French revolutionary soldiers with fire and destruction in their train; the Elector disappeared with his brethren west of the Rhine in the new arrangements of the Peace of Lunéville, and Trèves was reduced to the *chef lieu* of the department of the Saar; until in 1815 the flood finally receded, and the treaties of Vienna added her and the surrounding territory to the Prussian kingdom. The Electorate of course no one dreamt of restoring; there was no longer a King of the Romans to be elected, and ecclesiastical potentates had been found unsatisfactory in both their capacities. But the archiepiscopal chair might at any rate have been set up again, and the historical associations of the cradle of Teutonic Christianity respected. Practical convenience was, however, suffered to prevail, and when even the primatial see of Mentz was degraded to a simple bishopric, Trèves could scarcely expect to receive better treatment. It is now a fairly prosperous, quiet, old-fashioned town of 22,000 souls, with a body of Roman remains far more numerous and varied, if not individually more striking, than any other place north of the Alps can show.

Of these the largest and best preserved is the famous Porta Nigra, a splendid double city gate, surmounted by towers, which, after having been turned into a church, and so used for eight centuries, was restored to its original purpose by the Prussian Government soon after they became masters of Trèves. One may remark in passing that they have shown a great deal of taste and judgment, as well as of antiquarian interest, in their dealings with the city buildings. It is a noble piece of work in every way; its great scale, contrasting strangely with the houses from among which it rises, is the best witness to the majesty of the capital of Gaul in the second century. Certainly none of the present gates of Rome or any Italian or French city is equally imposing; even those of Carcassonne, though not less beautiful, are at any rate less massive. Most of the cathedral is Roman, and, according to tradition, the work of Constantine the Great; and although it cannot be called a beautiful building, the great variety of its styles, and the curious way in which each one is superinduced upon that which had preceded, make it extremely interesting to the student of architecture. Then there are Roman baths; a Roman amphitheatre, less perfectly preserved than those of Arles and Verona, yet whose parts are still all easily recognizable; a basilica which has now been restored into a majestic church, too large for the scanty Protestant flock that uses it; and many other fragments of Roman work scattered here and there in and round the city. More remarkable than any of these is one which lies about four miles off in the direction of Luxembourg. This is the famous Igel Skûle, or, as the country folk call it, the Tower of the Heathen (Heidenturm), a monumental column, 71 feet high, of elegant design, and covered with spirited bas-reliefs. The passion of the Romans for size, solidity, and pomp in their monuments to the dead is hardly more strikingly illustrated by the tomb of Cæcilia Metella or the pyramid of

Caius Cestius than by this tall and graceful pillar, which has stood for seventeen hundred years to commemorate the unknown parents of two wealthy citizens of Augusta Trevirorum.

Although the Roman buildings are the great glory of Trèves, it is not without other attractions, and might be commended to a leisurly traveller as a pleasant place to spend a week or even a longer time in. There is the same sort of air of dignified repose and old-fashioned respectability about it which one knows so well in some of the cathedral cities of England; and, as here there is really a past to repose upon, this air is more elevated and impressive than in any of them. The country round is extremely pretty in a quiet sort of way. The Moselle, not blue, indeed, but yet by no means so dirty as the Rhine, flows in an open, well-cultivated valley, hills of sandstone enclosing it on either side, whose tops occasionally rise into picturesque ranges of miniature crags; and upon one of these immediately over against the city a statue of the Virgin has been lately erected by a bishop (the same, we believe, as he who discovered the Holy Coat), and, the never-failing Restauration and Bierlokal having sprung up hard by, it has become a favourite place of resort for citizens and strangers. Although the height is not great, being some 300 or 400 feet only above the river, the view is extensive and singularly beautiful, what with the striking old town below and the warm tint which the prevalence of red sandstone rock gives to the whole landscape. A little below Trèves begins the finest part of the Moselle scenery, which well deserves to be enjoyed more deliberately than one can enjoy it in passing swiftly down to Coblenz by steamer. To our mind it is superior to that of the Rhine, though this is a point on which tastes naturally differ very widely. The stream is of course by no means so large and strong; instead of towns, one has only villages, and by no means such a wealth of castles, ruined and other, as line the shore of the more famous river. But the Moselle scenery is the more gracious and softer in lines and tints; the hills are better wooded, the rocks less stern; the whole effect is, in the strict sense of the term, more picturesque, and reminds one frequently of that most picturesque of rivers, our own English, or Welsh, Wye. And it is no small additional source of pleasure that one can admire the beauties of the Moselle, like those of the Wye, at one's ease, instead of in the midst of a jostling crowd. North-east of Trèves, and all along the north-western bank of the river, lies an extremely pretty country, into which one may make pleasant little excursions; and if there is time to lengthen them, one may pass on into the Eifel region, with its extinct volcanoes and wood-embosomed lakelets filling old craters, one of the most primitive and least visited parts of Germany.

THE PARIS STAGE.

IN the early part of October, when the theatres of London are in the full swing of a new season, little change is generally observed in those of Paris. The true Parisian public does not return until the middle or end of the month, and the provincials who flock to the capital at its beginning are well enough satisfied with the old pieces, which to them are new. As, however, at the best theatres of Paris as much care is bestowed by the actors upon an old as upon a new piece, it is the part of the house in front of the footlights which suffers most from this state of things. As a general rule the audience at the Français is as good a model to spectators as its plays are to actors. It would be difficult to find in London a worse audience than some of those which have filled the Français during the last two or three weeks. It is perhaps due to the presence of the provincial element that at a very different theatre from the Français, the Folies Dramatiques, the unceasing *Fille de Mme. Angot* is going on with apparently as much popularity as attended it exactly a year ago. Another piece which is enjoying a long run is M. Offenbach's *Orphée aux Enfers* at M. Offenbach's theatre, the Gaité. This is probably due rather to the magnificence of the spectacle than the merit of the acting or of the well-known music, to which, however, considerable additions have been made. One whole act has been supplied under the title of "Le Royaume de Neptune." This act has nothing to do with whatever movement or plot there is in the piece, and merely serves as an excuse for scenery, costumes, and ballets. It must be said that, from the point of view of gratification to the eye, the end in this case justifies the means, and the success of the whole piece as a spectacle is well deserved. The beauty of the scenery, the costumes, and the grouping is great, and the effects are arranged with that touch of graceful imagination which is wanting in entertainments of the same class in England.

Considerable interest has attached to the farewell performances of Mlle. Delaporte at the Gymnase before her departure for St. Petersburg. For these performances MM. Gondinet and Deslandes's comedy of *Gilberte* was selected. It is perhaps needless to say that the motive of the piece is that which seems inextricably associated in the minds of modern French playwrights with the name of comedy. The play belongs to the school in which M. Alexandre Dumas *filz* has long been pre-eminent. The name of the founder of this particular school rests in a happy obscurity. It is a curious reflection that the first impetus to what may be termed the criminal domestic drama, now so popular in France, was given by German influences. The species of play of which *Canning's Rosers* is so admirable a parody set the fashion of making the Seventh Commandment the mainstay of the drama. The fashion spread to England, where it has happily gone out, and

to France, where it has not. *Gilberte* has this advantage over most of the younger M. Dumas's plays, that there are one or two reputable people in it, and that the heroine is a fine character. M. Dumas seems to delight in making the Devil even blacker than he is painted; all his characters either lead or have been leading a vicious life; if there is one among them, such as Ollivier in *Le Demi Monde*, with something like high aspirations and noble impulses, he is straightway forced into a position which obliges him to choose between two evil courses. Never is a fine character or action represented without some attendant circumstance which blackens its purity. The consequence of the mean view of life thus taken by the author is that his plays are imbued with a dry and sombre quality for which not all the brilliancy of his wit and ingenuity of his construction can atone. Throughout all his cleverly contrived acts there is never a touch of poetry or imagination to relieve the ignoble nature of the scenes represented. In *Gilberte*, as has been said, all is not ignoble. The play opens with the heroine's refusal to marry the man whom she loves, and whose union with her her mother ardently desires, because she has discovered that upon her marriage all her mother's fortune will pass to her. The scene in which she refuses the Count de Guerches, while unable to assign any reason to her mother except an unreasonable resolution not to marry, was given with pathos and truth by Mlle. Delaporte. In an interview with the Count himself she explains her real motive, and he devises an arrangement by which the legal conditions of her marriage can be concealed from her mother. As the Count and *Gilberte* have been happily married for some months at the opening of the second act, it follows that some event must arrive to disturb their happiness. In accordance with precedent this event takes the shape of a former mistress of the Count, to whom *Gilberte* believes him to be still attached. The catastrophe of this act is well imagined, and *Gilberte's* exclamation, "Elle était sa maîtresse," upon which the curtain falls, was forcibly rendered by Mlle. Delaporte. The two remaining acts are occupied by the development and happy settlement of the principal intrigue, and the somewhat farcical comedy of a clever underplot. Mlle. Delaporte is an actress whose merit seems to lie in the portrayal of pathos and passion suppressed by the exigencies of society; and in a certain freshness and grace which belong to her speech and gestures. She has one great fault, which is the frequent repetition of the same action. The authors may be blamed for making *Gilberte* continually fall into her mother's arms or on to a sofa and burst into tears. A greater artist than Mlle. Delaporte, such an artist as Mme. Pasca, for example, would have known how to triumph over this difficulty. Mlle. Delaporte in these situations makes one forget the character and remember the actress. Other characters in the play were well filled by M. Andrieu as a frivolous man of fashion, and M. Ravel as a juvenile old man. M. Lesueur, who sustained a character of some importance, has certainly not improved his style in comedy by the departure which he made some time ago to extravaganza. One clever effect in the piece was due to a mute personage represented by M. Martin. He attends a reception where he knows nobody and nobody knows him. He sits for some few minutes without speaking a word, then stealthily looking at his watch, makes his bow, and goes out. The scene was played with just that touch of exaggeration which is necessary to make an embarrassing situation amusing upon the stage. *Gilberte* was preceded by a one-act piece of M. Gondinet's called *Les Révoltées*, which still holds its place in the bill. It is neatly constructed and written, and is further worthy of attention from the clever and delicate acting of Mlle. Legault in the principal character.

Notwithstanding the merits of *Gilberte*, it is pleasant to turn from the disagreeable and unimaginative atmosphere of drawing-room vice to the grace and poetry of Mignon as interpreted by Mme. Galli-Marié at the Opéra Comique. The character makes great demands upon the resources of the actress, which she seems more than able to satisfy. Mme. Galli-Marié has that rare power which carries the hearer and spectator away with her own emotion, prevents him from perceiving, except by the after-light of reflection, the disadvantages of figure with which she has to contend, and causes him to see her so long as she is upon the stage only in the likeness of Mignon. The changes of the character which are worked out in *Wilhelm Meister* become necessarily somewhat sudden when they are compressed into a three-act opera. This defect also the power of the actress conceals. The ingenious manner in which MM. Carré and Barbier have arranged the story of *Mignon* as a lyric drama is already known to the London public. The dialogue, for which, in obedience to the somewhat senseless law of Italian opera, recitative has been substituted in England, is worthy of praise. It is lightly and gracefully written, and seems to bear just the right proportion to the music. The most remarkable scenes of Mme. Galli-Marié's acting are perhaps that in which she adorns herself with Philina's paints and dresses, and the following one, wherein she pronounces a malediction upon the theatre which is the scene of her rival's triumphs. In the first of these scenes Mme. Galli-Marié's timidity and hopeless jealousy are full of true pathos, while her childlike gaiety at seeing herself rouged and powdered is irresistibly infectious, and has also that pathetic ring which a child's laughter always possesses. In the second scene the child's nature has disappeared before the woman's hatred, in which the barbaric element born of a wandering life comes out. So intense is her passion that one almost expects to see her invocation compel an answer. The tenderness of the last act is rendered with quite as much truth as the fierce emotion of the second, but the scene is the worst constructed in the opera, and ends with

the mistake of an anti-climax. The opera is well mounted and well played throughout, and the beauty of Mme. Galli-Marié's singing gives an importance to the music which it would otherwise hardly possess.

Pending the production of *Le Demi-Monde*, which is to take place towards the end of the month, the Français relies mainly upon the revival of old pieces. *Tabarin* is, it is true, a play which was produced for the first time not long ago; but *Tabarin* is not strong enough to form an attraction by itself. It is ill-constructed and not very well written, and M. Coquelin's performance of the chief part has certainly not been more than a success of esteem. An actor of peculiar talents and great force is required to render adequately the alternations of real passion with assumed buffoonery upon which the interest depends. Such an actor as Frédéric Lemaître might have made the play very impressive. M. Coquelin has not succeeded in doing this. The comic passages are admirably interpreted, as one would expect, but the actor has to struggle with the disadvantage of their comedy being somewhat heavy. To the success of the passionate scenes in M. Coquelin's hands there is only one thing wanting; but that one thing, real passion, is of considerable importance. The part is given throughout with cleverness and perception; the spectator feels all the time that the artist knows very well what he is about. This is the one thing which the artist should make him forget. There is one passage in which M. Coquelin displays real feeling. *Tabarin* is on the mimic stage, delighting the audience with his extravagant farce, when the news reaches him that his wife's desertion in the play has been turned by her into earnest. As his horror at the news fits into the plot of the piece, the audience, imagining it to be assumed, applaud him more at every burst of grief. Carried away by his feelings he assures them in vain that he is not acting, and begs them to let him leave the stage and start in pursuit of his wife. On their refusal he bursts into a vehement invective against them, mixed with contempt for himself as the creature of their caprice. "Voulez-vous me voir rire?" he cries, and follows the question with an hysterical laugh. In this scene only does M. Coquelin seem to lose his own identity and enter into that of *Tabarin*. On the whole, M. Coquelin's performance in this play has proved with tolerable certainty that he could never succeed in playing *Triboulet*, of which there has at times been some talk.

The play most frequently represented at the Théâtre Français lately has been Scribe's comedy *Une Chaine*. The plot has something of the disagreeable character which we have spoken of before; a young musician is as anxious as all his friends are that he should marry his cousin; and there is the inevitable mistress in the background. This idea was probably not so well worn in the time of Scribe as it is nowadays. It must be remembered also that Scribe was very far from confining himself solely to that idea in the construction of his plots. The tone of *Une Chaine* is very different from that of the more modern plays which depend upon the same kind of plot. There are none of the ardent love passages between the hero and the woman whom he ought not to love which abound in the plays of to-day, none of the morbid analysis of illicit passion, none of the mis-called morality which many people have been so anxious to hear upon the English stage. As the title of the piece would indicate, the chain which binds the young man to his past life is felt and described by him throughout as a chain which is heavy to bear:

Cette position si délicate [he says, describing his situation to a friend], si envahissante, vous apparaît peu à peu telle qu'elle est, une position fautive, terrible, dangereuse! Vivre dans une dissimulation et un mensonge continuel, veiller sans cesse sur ses démarches, ses di-cours, ses regards, n'oser avouer à personne son bonheur ou ses peines, porter le trouble dans un ménage, tromper un galant homme qui vous tend la main, qui souvent même vous accable de son amitié, voilà votre existence de chaque jour. Et si dans un moment de dépit, de honte, de remords, on se sent le courage d'abandonner un bonheur qui vous rend si malheureux, si on se surprend à désirer une vie moins pleine d'émotions, . . . alors seulement on s'aperçoit qu'on n'est plus maître de son avenir; et quelques séduisants que soient les liens qui vous retiennent ou vous enlacent, des chaînes de fleurs sont toujours des chaînes!

This speech is delivered by M. Pierre Berton, who has certainly not improved since last year when we spoke of his first appearances at the Français. He appears clumsy and ill at ease upon the stage, and seems unable to manage either his voice or his action. Before he enlisted in the ranks of the Comédie Française he was considered an actor of great promise, or rather of great performance, since he was even spoken of as second only to Delaunay in the heroes of comedy. In many cases besides that of M. Pierre Berton it has been experienced that the perspective, so to speak, of the Français stage has made a wonderful difference in the effect produced by actors from other theatres. Herein is one of the advantages afforded by the existence of a high standard. So long as there is nothing better wherewith to compare that which is moderately good, it may pass for excellent. It is upon Mlle. Favart, Mlle. Reichemborg, and M. Coquelin, so far as acting is concerned, that the success of *Une Chaine* chiefly depends. It would be difficult to point to a better representation of pretty girlish innocence and confidence than that given by Mlle. Reichemborg in the character of Aline. M. Coquelin plays Balandard, a simple-minded *amoué*, the intimate friend of the hero, to whose intrigues he looks up with awed admiration and some touch of envy. He is continually finding himself involved in some way in these intrigues against his will, and arriving at critical moments as a kind of unconscious *Deus ex machina*, who is employed by all the people in the piece to extricate them from their difficulties. The intricacies of the plot are managed

with a skill and probability in which few writers have equalled Scribe, and the ludicrous situations in which Balandard is constantly placed form a happy setting for the more serious interest. M. Coquelin's Balandard is as comic as possible; but his rendering of the character is not altogether satisfactory. M. Regnier, under whom M. Coquelin studied, played the part many years ago, and, while he did full justice to the humour of the *amoué's* embarrassments, he conveyed the idea that he was a gentleman, as a high-class *amoué* should be, although a man who had not mixed in society. This idea M. Coquelin does not suggest. He displays the tendency to exaggeration, to Palais Royal buffoonery, which is his besetting sin. For the moment the spectator is carried away by the actor's comic power, but it is matter of wonder to him afterwards that the great personages of the piece should have taken much interest in so unrepresentable a being as M. Balandard. Mlle. Favart, as Louise, the wife of M. de Saint-Géran, and the mistress of Emmeric, the young man, displays a good deal of the power which the great M. Sarcy has announced that she has lost. It is true that the actress's fault of extreme slowness in speech has gained upon her, but there is much truth in her representation, and the final scene, in which she renounces all claim upon Emmeric, recalls her best performances. M. Febyre, who plays Saint-Géran, M. Bressant's old part, is the only actor now in the company of the Comédie Française who has anything like M. Bressant's dignified and impressive presence. His performance would be admirable if it were possible to hear more than half of what he says. M. Got does not seem to bring his full resources to bear upon the rather thankless part of Clérambeau, Aline's father.

In consequence of the preparations for the production of *Le Demi-Monde*, M. Delaunay, the most brilliant artist of the Théâtre Français, has only appeared once during the last three weeks. That appearance was made in one of the very best of his lighter parts, that of Valentin in Alfred de Musset's proverb, *Il ne faut jurer de rien*. This piece is well known to London playgoers by the representations of the Comédie Française during its visit to England. M. Delaunay's performance appears more gay, more spontaneous, more impassioned than ever. It is with a rare skill that the actor brings out the good heart of Valentin underlying his cynical theories. The inimitable humour and drollery of M. Got's Abbé seems also to gain by the progress of time. M. Thiron plays the part of Van Buck, filled in London by M. Barré, and plays it with greater delicacy and finish. Mlle. Reichemborg appears in the character of Cécile, which was played by Mme. Lafontaine as long as she was a member of the Théâtre Français. The younger actress has all the freshness and innocence which belonged to Mme. Lafontaine's performance, and has besides a distinction which was always wanting in Mme. Lafontaine. The only other late event of importance at the Français has been the reproduction of Voltaire's *Zaïre*, with M. Monnet-Sully as Orosmane and Mlle. Sarah Bernhardt as Zaïre. M. Monnet-Sully has all the merits, but he has also all the faults, which he had a year ago. He has not yet learnt how to turn his great natural advantages to the best account. He has fine bursts of passion, but they are only bursts. There is no gradation in his emotions. He is "too rash, too unadvised, too sudden." His gestures and facial expressions are extravagant. The Voltairean Othello is a person of so violent a character that any exaggeration in the part becomes dangerous. It seems also as if M. Monnet-Sully had not yet arrived at the right method of conveying his passion to his audience. One feels that the emotion is there, but has not succeeded in finding the outlet by which it may be transmitted to those who do not share it. In criticizing M. Monnet-Sully's Orosmane it may be well to remember that almost exactly the same faults were found with Talma's first appearances in the same character. With Mlle. Sarah Bernhardt's *Zaïre* it would not be easy to find much fault. It is graceful, tender, and impassioned, and adds to the artist's well-deserved reputation. M. Pierre Berton's *Nérestan* is perhaps the worst thing that M. Pierre Berton has done.

The opera has been chiefly distinguished by the success of Mme. Patti's first appearance in Paris both in French and in tragic opera, in the trying character of Valentine in the *Huguenots*. The preparation of the new Opera House is going on rapidly. Till a short time ago the designs for its decoration by M. Baudry were exhibited at the Musée des Beaux-Arts. It is difficult to judge of paintings which are destined for a curved when they are seen upon a flat surface, but it may be safely predicted that they will be effective. One or two groups and figures would be remarkable for their strength and beauty among any class of paintings.

LIFE IN SPAIN.

MR. BUCKLE may have been justified in defining the Spanish Peninsula as a torpid mass, but it is certain that society in many of its provinces finds life at this moment by no means unexciting. The Spanish people generally are selfishly indifferent to their neighbours' troubles, owing partly to the stolid ignorance which knows of nothing that goes on beyond the limits of its own narrow horizon, partly to the fact that Spain is practically a federation of kingdoms cherishing the old international jealousies. So long as the shepherd of Estremadura, the ploughman of the plains of La Mancha, or the vine-dresser of Andalusia is not drawn for the levies which are continually being decreed by the authorities, he

scarcely cares to inform himself of the condition of the Northern provinces; while to the mobs of place-seekers who go to make up the intelligence of the capital all news is good news that creates temporary excitement. The loungers of the Puerto del Sol are thoroughly well informed as to everything that has never happened and never will happen, and they discuss the flying rumours of each passing day as if it were some Spanish Republic in Southern America that was being convulsed by the civil war. But the troubles of Spain are fast extending their area and ramifications as they grow more intense and inveterate at the centres from which they originally started. They are no longer little wars of brigands in the mountains of Navarre and the Biscayan provinces. They are breaking out and spreading in almost every district where there are natural fastnesses commanding the flats—and Spain is the country of sierras. The communications between the interior and the chief seaports on the Northern and Eastern coasts are threatened, and the capital itself may any day awaken to find itself deprived of those *canards* from foreign Courts which are the delight of its feverish existence. The rails have already been dragged up by sections more than once on the lines that link Madrid with Valencia and Alicante; and, when the French and English Ministers travelled southwards to their posts from Santander, their safety had to be ensured by special escort. Englishmen who are used to the anxious guardianship of their police, their law courts, and their Legislature must necessarily be slow to realize the conditions of a Spaniard's existence. We go into paroxysms of alarm over a few cases of garroting in the suburbs of London, and agitate ourselves for weeks over the failure of the detectives to get upon the traces of some brutally commonplace murderer. We growl and combine and get up petitions against the addition of an extra penny to our rates. But over a great part of Spain, drumhead trials, murders, and military massacres are matters of everyday occurrence; no man can count upon his liberty for a day, or can call his property his own; commerce is paralysed, and capital is scared away or lies idle; the open towns and villages are occupied in turn by the contending factions; and more than one fortified place is in course of slow starvation, with the probable contingency of sack should treachery hand it over to the enemy.

The inhabitants of the districts that favour the Carlists are suffering the most severely, as perhaps they deserve to do. It was they who originated the present troubles, although most of them probably were but languidly 'loyal,' and were drawn on to commit themselves to the struggle by a lawless and desperate minority. A correspondent of the *Independence Belge* points out that it was the Contrabandistas of the Pyrenees and the seaboard who first rallied to the banner of Don Carlos when he crossed the frontier with his escort of fifty followers. Reckless men who get their living by fishing in troubled waters naturally calculated that civil war would pay them, as it very likely may have done. They have always been the "King's" most trustworthy troops; consequently they have given the tone to the warfare. As the writer in the *Independence* says, Carlos began a war of Contrabandistas, and now, in spite of himself, he is at the head of a war of brigands. But, though individuals may have served their selfish ends and made their profit, even the Carlist places that have been continuously in Carlist occupation cannot have come off cheaply. Irregular levies have swelled into formidable armies—formidable, at all events, so far as numbers are concerned—and they must be fed and clothed in some fashion. Razzas on the districts which are either avowedly hostile, or would be neutral if they dared, no longer suffice to support them. The King or his representatives issue their commands; the curé of the parish preaches the sacred duty of anticipating the contributions that are to restore the Monarchy and re-establish the supremacy of the Church; and the bigoted and loyal people have been paying more or less cheerfully. But it is not in human nature to have even the holiest of causes so nearly at heart as to be content to sacrifice to it the whole of your substance, to say nothing of every able-bodied male in your family, while the ultimate triumph of the cause still seems remote and doubtful. Those Carlists, however, who live within the limits of their friends' garrisons are comparatively lucky, and it is their neighbours and countrymen on the debatable ground between Royalists and Republicans that have most reason to curse Don Carlos. There are places, once as thriving as any in Northern Spain, which now change masters regularly about once a month. Their friends requisition them almost as remorselessly as their enemies, the only difference being that the former make a pretence of paying honourably in bonds which may possibly be negotiable one day, should the side that issued them win, and succeed in balancing the deficits in the treasury. The Spaniards are by nature a provident and frugal, if not an enterprising, race, and men who used to be envied for their wealth must now rather be the objects of condolence. When it is a question of forced contributions, it is on them that the brunt of the burden falls; and when there is any difficulty about extorting the requisite contributions, it is their persons that are attached as material guarantees. Whatever may be the honours of high municipal office, there is no doubt nowadays as to its awkward responsibilities. The Alcalde prudently disappears in time if he believes that his opinions or actions have compromised him with the latest comers. By disappearing he may keep his person safe, but his house and goods are made answerable for him in the meantime, while his name is of course registered in a black list, and the record of his misdeeds will rise in evidence against him should his enemies ever have the opportunity of avenging

themselves. The inhabitants of these open places are seldom shot in cold blood, unless some influential member of the occupying force should chance to have a personal quarrel with one of them; but in fortified cities, carried by treachery or assault, the case is different. We know what atrocities were perpetrated by civilized troops when citadels like Badajoz and Ciudad Rodrigo were taken by storm in the Peninsular War; and we may conceive the scenes that are enacted in a helpless city with brigand bands broken loose in it, left to go to work in their own way, and recompense themselves for former privations and pay in arrears. When the rest of the country is groaning under the war, it might be supposed that the soldiers at any rate have no great cause to complain. But discontent is notoriously rife among the armies on both sides, and with very good reason. The Carlist partisan leaders and their brigand followers may be pleased and happy; but the Carlist army would not have grown so fast had it not been largely recruited by ruined peasants and small village tradesmen who found their occupation gone. As for the soldiers of the so-called Republic, they make no secret of detesting the service on which they are ordered. They might as well be transported on a forlorn hope to follow Cuban insurgents through tropical swamps, as be sent in inadequate numbers under a plunging fire to assault positions selected as traps by the enemy, or be left isolated and unsupported on short rations to hold ill-fortified towns on the chance of ultimate relief. Unseasoned to fire or to hardships, most of them have been taken from their fields or their trades sorely against their will, and are impatient to return to a quiet life; while the Carlineers, who are soldiers in reality as well as in name, and married men to boot, complain of being always ordered to the head of the columns because it is known they can be trusted not to run away.

As we have said, this sort of thing is no longer by any means confined to the provinces which we have been accustomed to consider as the seat of war. *Cabecillas* are beginning to make their appearance in most places where there is a sierra with a populous plain within reach of it; and the consequence is that large classes begin to suffer indirectly whose persons are beyond the reach of immediate violence. The commerce of the country languishes, as customers are everywhere impoverished, and private credit is shaken in sympathy with that of the State. Men must indeed have an assured character for solvency for their bills to pass current, or their orders to be executed unhesitatingly, in such a state of things. With Carlist partisans commanding the railways that lead to the great Eastern seaports, with spies flourishing everywhere who know who is likely to pay them if they can give valuable information, no merchant can reckon on the arrival of any consignment of goods. As for the railways themselves, the position of railway property gives the foreign shareholders every reason to sympathize with the deplorable condition of the country in which they have invested their money. Even where the lines have apparently no strategical importance the Carlists make a point of damaging them to the utmost whenever chance makes them temporary masters of the situation. Bridges are broken down and stations burned; station-masters are shot; trains full of passengers are run off the rails, and the rolling-stock smashed with the servants in charge of it. Again, many English and some Continental Companies have taken to exploring the mineral treasures of Spain, and most of their speculations, as it happens, are being conducted in the districts infested by the Carlists. All these mines are managed by Englishmen and other foreigners, who have naturally become the especial objects of Carlist assiduities. The English, in particular, are known to be rich, and it is taken for granted that their Companies are successful and wealthy. Their concessions and the guarantees which they hold come from those Liberal authorities at Madrid against whom the Carlists have proclaimed war to the death. Metals are tempting in any shape to zealous belligerents; from iron and lead up to silver and gold, they all supply the sinews of war. So the mine superintendents and other agents are surrounded by prowling hordes, who would at once spring upon them and rend them, materially defenceless as they are, were it not for the protection, such as it is, which their nationality throws over them. Threats which might shake ordinary nerves are freely employed, and although the responsible authorities may shrink from translating threats into action, a crime is soon committed, and some of the fiercer partisans are practically independent and uncontrollable. We are told that the foreign adventurers conduct their business as before, affecting an impassibility which it is quite impossible that they can feel. Their resolute bearing does credit to their Northern blood, but not the less must the strain on them be terrible; and were it only for their sakes, we should rejoice to see this baleful war brought to a conclusion.

THE CULTIVATION OF BRUTALITY.

SOME of our readers may have observed in the windows of the lower order of news-agents a large and imposing-looking broadsheet covered with vigorous but coarsely executed woodcuts. There is usually a bold and striking centre-piece, surrounded by a number of smaller pictures; and the first glance conveys the impression of a wild whirl of legs and arms in every attitude of violent contortion. On closer examination a certain monotony is discovered in the subjects of the pictures. Indeed, though there is variety in the details, the subject is almost always the

same—either a murder or some other exhibition of ferocious brutality. This accounts for the remarkable display of legs and arms, which are all supposed to be working with intense muscular activity. The force of a kick or blow is indicated by the epileptic convulsions of the person dealing it, and the equally frenzied gymnastics of the victim. There is no mistake as to the earnestness with which all this maiming and murdering is carried on; the assassins are provided with weapons of the most imposing size, bludgeons as big as paviers' rams, knives like cutlasses, and pistols that discharge as much flame and smoke as a lively howitzer; and if any blood is supposed to be shed, it is poured forth in a torrent which threatens to wash away all the actors in the scene. We are not exactly aware how long this publication has been going on, but its illustrations seem to have been becoming more powerful—that is, more horrible and revolting—during the last year or so, and it appears to command a considerable circulation among the lower classes. It is, in fact, the most conspicuous literature of the back streets and alleys, where its influence extends far beyond the circle of its readers. Its monstrous pictures make it an attractive advertisement in a window, where it is keenly studied and discussed; and in many a dingy nook a fly-blown back number is a constant source of amusement and instruction to children, who thus obtain their first impressions of life. This edifying periodical is called the *Police News*, and its object seems to be to present in a concentrated form the cream of all the horrors of each week. There are plenty of these horrors no doubt in the ordinary newspapers, but then they are mixed up with other matters which tend to divert attention, and to dissipate the high flavour of criminal news when taken by itself. The newspapers certainly give one the idea that, notwithstanding the progress of civilization, there is still a large element of primitive ferocity and inhumanity to be subdued, but, on the other hand, they afford glimpses of the higher and nobler aspects of life. The *Police News* uncompromisingly confines itself to the darkest side of human nature. We find ourselves in a world where nothing ever happens except murdering and getting murdered, kicking and being kicked, save, indeed, when the perpetual outrages and brutalities of our fellow-creatures are occasionally varied by death or torture attributable to accident or the operations of nature. Beating, biting, kicking, strangling, stabbing, and shooting, appear to be the only occupations of society. Every week there are three large closely printed pages of crime and misery, and another page of pictorial horrors for the benefit of those who cannot read, or whose unassisted imagination fails to realize to the full extent the atrocities described in the letterpress.

We have now before us three numbers of this publication, taken at random. In one the central picture represents the Regent's Park explosion, with the bodies of the bargemen blown into the air. Next we have the Plymouth murderer cutting his wife's throat with a razor. He has seized her by the shoulder and is hacking away with the razor in an extremely vigorous manner, and apparently with a keen relish for his work. Then comes the Leicester Square murder; a man flinging a woman over the top of a stair. "An Encounter with a Mud Dog" shows a man sticking a pitchfork into a dog which is supposed to be attacking him. In "Cruelty on Board Ship" we see a merchant captain beating a sailor about the head with a huge iron bar. "A woman brutally treated" is an animated composition. The woman is on her knees, and while a ferocious hound is gnawing her hands, a man is pulling her hair and pounding her in the face with his disengaged fist. There is one picture which seems to represent a horse eating a little boy, and the heading of which—"Extraordinary Sagacity of a Horse"—rather puzzled us. It seemed to suggest that if horses were wise they would always eat little boys when they got a chance; but on turning to the letterpress we were relieved to find that the horse was only rescuing the boy from a pond. The artist, however, has given a characteristic air of atrocity to this simple incident. In a picture of an encounter at sea with a monster cuttle-fish he indulges his vivid imagination to the utmost. Probably, common murders and kickings had been growing stale, and it was thought desirable to give a whet to the popular appetite. The cuttle-fish is about the size of an elephant, and embraces the boat with his enormous suckers, which resemble bloated bon-constrictors. The diabolical fury of his countenance is powerfully rendered. The accident at Thorpe is of course duly turned to account, and we have also a highly realistic picture of the murder of Captain Bird at Aldershot; after this a fight between a dog and a snake, and an elephant throwing a little boy up in the air, are rather tame. With a keen appreciation of the tastes of his readers, the editor has apparently persuaded his artist to impart to the countenances of the various persons in the picture representing Lord Rivers and Dr. Kenealy visiting Orton in prison an air of gloomy ferocity which shall make them look as like murderers as possible. Another number contains pictures of a man being guillotined, a murderous attack on a wife, two drownings, and a boy being worried by a wolf. What we have said will perhaps convey a sufficient idea of the style of this publication. There is nothing peculiar in the literary part of it, except that it is exclusively devoted to crimes, accidents, and all sorts of unpleasant and revolting incidents. There is no attempt, however, to work these things up into fine writing. The working up is left to the artist, whose productions are evidently inspired by a genius similar to that of the writer to whom we are indebted for so many harrowing articles in the *Daily Telegraph*. He has a quick eye for everything that is horrible and disgusting, and knows how to give the necessary prominence to the most

sickening incidents of carnage and physical agony. He is aware that in such a case the delicacy of mere suggestion would be out of place, and we are therefore spared none of the details of ruffianism and butchery. It is true that, as we have hinted, there is a certain monotony both in his subjects and style of treatment, but after all this very monotony helps to make the series of pictures more impressive. Just as water wears the stone by continually dropping on the same place, so the constant repetition of the same idea, especially when simple and easily grasped, adds immensely to its influence on those upon whom it is directed. It sinks into their minds and saturates their character. The result of having habitually before one's eyes the sort of atrocities which are portrayed in the *Police News* must necessarily be to deaden the sensibilities and brutalize the instincts of those who dwell upon such thoughts, and to make them callous and indifferent to human suffering. There is nothing which tends so much to produce brutality as the familiar contemplation and enjoyment of it as a part of everyday life; and there can be little doubt that the effect of such a publication as this on rough and ignorant people must be to develop and intensify the villainous appetites to which it appeals.

It is of course much easier in such a case to point out the evil than to suggest a remedy. It is an established principle of English law that publications which can be shown to exercise an immoral influence ought to be suppressed; but though the general principle is clear, its practical application is attended with much difficulty. The exhibition or sale of indecent photographs has lately been checked by the intervention of the police; and it may be reasonably contended that pictures of the kind which are weekly published in the *Police News* are, in another way, not less demoralizing. Many reasons have been suggested to account for the recent increase of crimes of violence, and it may be safely assumed that the disorder is not specially due to any one cause, but rather to a combination of causes all operating in the same direction. A sudden and considerable rise in the material prosperity of large classes of the labouring population, combined with an exaggerated estimate on their part of their right and power to do pretty much as they please, naturally had a disturbing effect. Higher wages and shorter hours led to an enormous increase in the consumption of liquor; drinking makes people feverish, irritable, and reckless; and the disappointment which has more recently been caused by a partial reduction of wages has given a more acute form to the prevailing epidemic. The working classes have been confused and bewildered by the economical changes arising from a period of inflation followed by a relapse, and they have been spending most of their gains in the public-house. Unfortunately habits of indulgence are not always readily shaken off when the means of gratifying them have been withdrawn. It is easy to discover in these circumstances the chief source of the distemper from which a certain section of the population has been suffering. It would be extravagant to attribute to the circulation of such publications as the one of which we have been speaking, the origin of the malady; yet it may readily be believed that it has done much to intensify and spread it. Public executions have been given up because it was believed that they had a corrupting effect on the crowds which witnessed them, but the ghastly and horrible pictures of the *Police News* now supply the lower classes with a chronic excitement of an even more pernicious character. Executions, after all, do not take place very often; but here are, week by week, sensational pictures of murders, suicides, savage assaults, roughs flinging women over the stairs or out of window, dragging them about by the hair of the head, kicking, beating, jumping on them, setting dogs to worry them, roughs fighting with roughs (though this is rather an exceptional incident), and, in short, every variety of bloodshed and wild-beast brutality. Indeed even the wild beasts themselves are introduced as an additional stimulant. Every page may be said to reek like the shambles; there is always somebody having his throat cut, or his head smashed in, or his body pounded to a jelly. It is impossible to doubt the utterly evil and debasing influences of this persistent exhibition of the animal ferocity of human nature; and if the *Police News* stood alone there would probably be little hesitation in putting an end to it. The difficulty is that, though it is a bad example of a detestable kind of literature, it would perhaps scarcely be possible to touch it without laying down rules which would curtail the general freedom of journalism. It would of course be impracticable to prohibit the publication of reports of murders and other crimes of violence, and, if these things are to be reported in one class of newspapers with full license of literary colouring, it may be asked why similar license should not be allowed to pictorial art. The answer which readily suggests itself is that, in point of fact, pictures of this class, which appeal chiefly to the ignorant and uneducated, really do more harm than literature. Still there are obvious difficulties in the way of drawing a line between what is allowable in this respect and what is not, and under the cover of these difficulties such nuisances as this revolting and poisonous publication will probably continue to elude legal intervention. The only hope is that those who have any influence with the classes who have a taste for this mess of horrors will use it to discourage the indulgence of a diseased and degrading appetite, and that some more wholesome kind of literature may be provided as a substitute.

THE THEATRES.

THE Adelphi Theatre maintains its character by a piece called the *Geneva Cross*, which the playbill states, and we can quite believe, has been performed with great success in the United States. It is essentially a "loud" play, and in the last act the ranting of the actors and the roaring of the cannon seem to be playing a match against each other. The hero of the piece, Riel de Bourg, is a German of good birth who has entered himself as a common workman at a French cannon-foundry in order to perfect his knowledge of artillery. He has fallen in love with Gabrielle le Brun, his master's daughter, and is forgetting his duty to his country, when he is reminded of it by a visit from a mysterious personage who produces to him a roll of parchment with appended seals, of which he acknowledges but resolves to defy the authority. The declaration of love between the German Riel and the French girl Gabrielle is followed by the declaration of war between Germany and France. Gabrielle brandishes a toy rifle, and declaims some words about the tricolour being an oriflamme which are in every point of view nonsense. The workmen of the factory, infected by her folly, shout "À Berlin!" and perform other antics proper to those who go to war and count not the cost thereof. This performance is, we suppose, acceptable in the United States where it originated, but in England the madness which began the Franco-German war and the misery which it inflicted are subjects almost too painful for the stage. But if we could get over our distaste for the play, some amusement might be derived from observing the extreme simplicity of the method by which it obtains considerable success. The whole of the last act passes in a casemate of one of the Paris forts. The comic element, which had been up to this point deficient, is supplied by a drunken sergeant of Communistic principles. The tragic and spectacular elements are in rich abundance. "Condemned to death. The last offer. Grand tableau"—this extract from the playbill is wholly inadequate to convey any idea of the tremendous character of the performance. There is a father praying his daughter to save his life by the sacrifice of her honour, a daughter preferring death to shame, a military gaoler using power to gratify passion, and all these talking the tallest kind of talk, until, while the Prussian shells are banging and crashing outside, the fort is finally breached by a grand explosion which kills the wicked hero and admits the heroic husband, who rushes in spiked helmet and drawn sword to the rescue of his devoted wife. The explosions are frequent and furious. The wall of the fort tumbles suddenly in picturesque confusion, and soldiers in Prussian uniform clamber over the smoking ruins and pose themselves with fixed bayonets round a black and white flag to which the tricolour, notwithstanding its resemblance to the oriflamme, has had to yield. The actor who performs Riel de Bourg, the German noble disguised as a French workman, seems to us equally unlike either, but perhaps a very red wig and a very blue blouse are traditionally accepted on the stage as indicating German birth and French habitation. It deserves notice that this play is condemned for its verbiage even by critics who do not object to its action as we do. We think much of the dialogue stilted, and sometimes it is grotesque; but surely a dramatist may be allowed to fill up an evening if he can. Critics are not bound to consider a manager's difficulties; and they may recommend the application of what is called the "pruning knife" without reference to the circumstance that if this piece is finished at ten o'clock some other piece must be begun. A large part of the first act is occupied with a quarrel between Riel and the overseer of the foundry about a letter which has been brought by the postman and bears a German post-mark. The overseer proposes to open the letter on suspicion that it contains treason, and Riel says that he will knock down the overseer if he does. Ultimately the letter is opened, and is found to contain a portrait of Gabrielle, the master's daughter, which comes to Riel from a friend at Stuttgart. Perhaps, if we had listened as attentively as we ought to all the speeches that are delivered on the subject of this letter, we should be able to explain how a correspondent of Riel at Stuttgart is able to send him a likeness of a young French lady residing at Auxerre. The young lady may have gone on a visit to Stuttgart and have been photographed by an artist there, or Riel may have obtained her photograph at Auxerre, and sent it to his friend at Stuttgart to ask him whether he thought her good-looking. However, the letter which was supposed to contain treason against the French Empire really contains only the portrait of a lady, and the production of it proves no more than this, that the supposed workman has taken the liberty to fall in love with his master's daughter. We suppose that the "pruning knife," if introduced, would be applied particularly to this scene, and we are tempted to ask why to this scene more than others. When a deputy remarked that yesterday's debate in the Assembly was dull, Mirabeau retorted "Pourquoi dater?" So we say, Why particularize? This play has been performed "with great success" in America, and if it was written by an American for Americans, the author may be supposed to have understood his business. It is easy, and probably correct, to say that a play which is in four acts might have been in three. We might go further and say that it need not have been at all. However, a combination of love, patriotism, feeble fun, and explosions has constituted time out of mind an adequate Adelphi drama, and we always thought that within a limit of five hours the longer those pieces were the better people liked them. An attenuated form of amusement may be better than none at all.

The rule that horrors should be talked about, not seen, has been

observed by Mr. Byron in the "new and original comedy" which he has written for the Strand Theatre. One act out of three, of which this "comedy" consists, is occupied with a picnic near Matlock, and it may be that the consumption of lobster salad and champagne, although not in itself particularly comic, is a suitable preparation for the absurdity which follows. A young lady desires to send one of her two lovers on a climbing excursion to pick flowers from the top of a rock. One of them, who is a low-born brewer, declines to risk a life on which his country depends for its supply of pale ale. The other, who has neither business nor fortune, but only supposed high birth to recommend him, declares that he will obtain those flowers "or perish in the attempt." He goes off to perform this hazardous exploit, and the young lady and the brewer remain upon the stage and watch his progress along steep and slippery rocks overhanging a dark and unfathomable lake. They "pile up the agony" in description, until the young lady grows alarmed at the perilous performance she is witnessing, and finally persuades her second lover to go to the assistance of the first. After a brief interval No. 2 returns leading in No. 1 who has neither obtained the flowers nor perished in the attempt, but has had a fall and lamed himself just enough to make him look interesting. A coarser artist than Mr. Byron would have allowed us to see this rash young man climbing up the lofty rocks and along the profound lake, and would have made him fall down what might be an infinite vertical precipice, explaining afterwards that a bank of moss stopped his descent at ten or a dozen feet. Something of this kind frequently crops up at some theatre in October when people have returned from their holidays, and have been seeing and talking about mountains for a month or more. But managers are not usually willing to sacrifice to any supposed canons of taste the advantage to be got out of a grand spectacular and sensational display. We must allow, therefore, that Mr. Byron has shown discretion in sparing us the actual ascent of the Peak and the fall which interrupted it; but then the time which is saved from horrors is devoted simply to inspecting a hamper and consuming its contents. This play is neither better nor worse than several other "new and original comedies" by the same author which have been lately brought out. One feels perhaps a little disappointed that at the beginning of a fresh season theatrical management should fall into the old familiar groove. Mr. Byron can always produce jokes, good or bad, and almost any scene of any of his comedies will serve to bring them in. This present comedy is called *Old Sailors*. The inevitable "heavy father" is a retired naval officer who remembers Nelson, and of course there is a confidential servant dressed and talking in the regular style which the British Tar adopts on the stage. This worthy couple bring to the picnic an enormous pie, and the servant proves the consistency of the crust by rapping it with a big stick. This might do well enough in a pantomime, but is not exactly comedy. Perhaps if Mr. Byron had made the more ardent of the two lovers declare that he would eat a piece of that pie-crust or perish in the attempt, he would have excited more interest that can be felt in a mere ordinary exploit of mountaineering. This declaration would have been the more seasonable, because even the steady-going lover makes a considerable display of heroism by drinking his own beer, and none but the brave deserve the fair. We have perhaps done injustice to the author by complaining that a large part of his second act is occupied with feeding, and only the small residue with climbing. If the literature of mountaineering were examined with an unfriendly eye, it might appear to consist in an undue proportion of descriptions of breakfasts eaten before and suppers after the assaults on peaks, passes, and glaciers which are its proper subject. If such an article as Mr. Byron's pie had been produced by any Swiss or Italian innkeeper, we may be sure that some adventurous tourist would either have eaten it or described it, or perhaps both. After all, perhaps Mr. Byron's comedy is good enough to precede the "bouffonnerie musicale" which is the real attraction of the Strand Theatre. Managers do not seem to have invested largely in "new and original" writing for the present season. Mr. Buckstone has re-engaged Mr. Sotherton and revived Lord Dundreary, and there must be a number of people who either have never seen this performance or want to see it again, and thus the manager of the Haymarket Theatre may avoid for some time those praiseworthy experiments which proved so unfortunate last season. It is a relief, at any rate, to find that a comedy by Mr. W. S. Gilbert has not become inevitable at the opening of this theatre. Notwithstanding a dictum of one of Mr. Byron's characters regarding salad, it is quite possible to have too much of a good thing.

REVIEWS.

LORD LYTTON'S SPEECHES.*

SPEECHES on topics which unavoidably and rapidly become obsolete are seldom interesting at a later time, unless they approach the highest type of excellence. Among the orators of the present generation, Mr. Bright alone satisfies the conditions under which oral eloquence becomes a portion of the permanent literature of

* *Speeches of Edward Lord Lytton*. Now first collected, with some of his Political Writings, &c. With a Prefatory Memoir, by his Son. 2 vols. London: Blackwood & Sons.

the country; yet Lord Lytton is justified in claiming for his father a place among the ten or twelve best speakers of his time. A certain interest attaches to the secondary and collateral pursuits of a successful man of letters. The Prefatory Memoir is avowedly "a short sketch of what was purely political in Lord Lytton's many-sided life." It is true that his activity was various and versatile, but his intellectual character was not in any sense many-sided. With the rare faculty of constructing a fictitious story Lord Lytton combined singular industry, which was stimulated by an impatient love of distinction. An accomplished but not a profound scholar, he attempted with little success to write erudite treatises, and he published several volumes of verse, although nature had denied him the qualities of a poet. In the less arduous art of oratory he succeeded better than in any of his numerous experiments as an amateur. If he had little of the passion of politics, he entered with intelligent sympathy into party contests, and his literary training furnished him with an abundant supply of illustrations and epigrammatic phrases. His own impulses were benevolent and generous, and on some questions, such as copyright and the duties on paper and on newspaper stamps, he was better informed and more strongly convinced than the mass of those whom he addressed. In dealing with subjects such as the Malt-tax or the Income-tax, which were less closely connected with his habits of thought, he adopted with creditable facility the conventional tone of the House of Commons and of his own party; yet it is impossible in reading his speeches on such topics not to feel that he is unconsciously assuming the imaginary character of a statesman in a novel. Dickens's actor who at a real wedding goes through the stage business of a heavy father was a faithful caricature of the artist who makes a study of his part in ordinary life. Among the most intrinsically valuable papers in the present compilation are letters and notes for speeches on the Russian war and on the Danish complications of 1864, and Lord Lytton's speeches on foreign policy are greatly superior to the rest. He was a genuine Englishman; and he was exempt from the narrowness of mind which disqualifies vulgar politicians from understanding questions which involve the national honour. Lord Lytton was apparently one of the scanty number of Englishmen who appreciated the mistakes of Denmark, and the passionate devotion of the entire German nation to the cause of their compatriots in the Duchies. International relations were large enough to satisfy and to interest his imagination. From domestic faction he generally held aloof, or he amused himself with engaging in the struggle as he might have taken a hand at whist. The editor judiciously abstains from republishing a pamphlet, which had a wide circulation at the time, on the dismissal by William IV. of Lord Melbourne's Ministry in 1834. Lord Melbourne, it seems, afterwards assured Mr. Bulwer that the pamphlet had exercised a great influence on the general election which followed, and the sincerity of his opinion was shown by an offer of a place in the Whig Government when it returned to office in the following year. The pamphlet itself contained an ingenious and frigid string of antithetic variations on the theme that it was absurd to change the distribution of political power because Lord Spencer, an elderly nobleman in a private station, had died. The Conservative reaction which the King had prematurely discerned was better worth discussing, but the subject was less susceptible of epigrammatic treatment. Young and ambitious essayists would do well to beware of the facile paradox that great events spring from trivial causes. Macaulay wasted much of his brilliant ability in futile demonstrations that history and biography are made up of impossible inconsistencies and arbitrary puzzles. It is no more extraordinary that a change of Ministry should occur when a trifling occasion brings powerful motives into operation than that it should happen on a Monday or a Wednesday. If William IV. had been sufficiently prudent and patient to wait for two years, Sir Robert Peel would probably have been able to form a stable Government. If Mr. Bulwer's pamphlet changed the opinion of a single elector, literary skill must have had more practical effect forty years ago than in those prosaic days.

If any young politician wishes to study the history of the generation immediately preceding his own, he will find much valuable information in the present collection of speeches. Lord Lytton's contemporaries, on the other hand, may feel a melancholy pleasure in recalling the half-forgotten interests and difficulties of their earlier days. The popular impression that the Crimean war was the deliberate result of a mistaken policy may be in some degree corrected by reference to the feelings with which its origin and progress were regarded by an eminent and patriotic member of the Opposition. A vigorous speech on Mr. Layard's motion on Administrative Reform in 1855 will revive the memory of one of the most unmeaning and transitory agitations which have at any time excited an attention disproportionate to their merits. The Administrative Reform movement was the only occasion on which Mr. Dickens made the mistake of publicly displaying on a platform his profound ignorance of political subjects. Sir Edward Lytton, in moving an amendment to the motion, showed that he understood better than his friend, the comic novelist, the necessity of party, the incompatibility of constitutional freedom with a Government of clerks, and the dangers which might result from the administration of patronage in deference to popular clamour. His remarks on the propensity of the Whigs of the time to confine high office to a few powerful families already possess historical interest. Twenty years ago satirists declared with approximate truth that all the members of the Cabinet, with one exception, were descended from

a single ancestress who flourished at the beginning of the century. Lord Palmerston, who was not himself of the privileged family, fully shared the objection of his Whig allies to the intrusion of new comers into the select circle. One of the oddest events of his life was the sudden collapse at the end of 1857 of the popularity which had at the beginning of the year procured the return at the general election of a large majority pledged only to support the Minister. The immediate cause of the change was Lord Palmerston's selection of Lord Clanricarde to fill a vacant office in the Cabinet. The House of Commons had at the same time become partially alienated from its favourite leader in consequence of a supercilious manner which he had adopted in the confidence produced by his personal triumph. The largeness and geniality of Lord Palmerston's nature were never so well illustrated as by his retention and development in old age of the invaluable faculty of profiting by experience. The haughty Minister who was driven from power in 1858 by the coalition of Lord John Russell, Mr. Cobden, Mr. Bright, Mr. Gladstone, and Mr. Disraeli, returned to office in 1859 at the age of seventy-four with all his faults of manner and temper corrected. From that time to the end of his life he was the most cheerful and the most affable of statesmen, and even his enemies confessed that his speeches displayed a marked improvement in style. It is interesting to notice the language of respect and admiration in which Lord Lytton always mentions the leader of the party to which he was in later years opposed.

Contemporary documents studied after an interval of time and of political change may from one point of view be regarded as fulfilled, or more often as unfulfilled, prophecies. It is well to know not only what a former generation did, but what it hoped and feared. One of the speeches in the present collection contains an argument against the abolition of the East India Company, and the transfer of the government to the Crown. In common with many thoughtful politicians, and with the great majority of Anglo-Indian statesmen, Lord Lytton apprehended serious danger from the subjection of the Indian Empire to the influence of English party interest and to the control of the House of Commons. His arguments even now appear to have been weighty; and it is certain that many of the advocates of the change had derived their early impressions from the tradition of an earlier time, and of extinct abuses which have been mainly perpetuated by the eloquence of Burke. It could scarcely be foreseen at the date of the transfer that ignorant indifference would produce the same beneficial results with deliberate abstention from interference. The House of Commons, instead of meddling with the details of Indian administration, cannot even be induced to meet in respectable numbers once in a Session for the Indian Budget. The habitual care of the Ministerial leader to postpone the Indian Budget till the end of July is an unnecessary, though perhaps a not judicious, precaution. Except in the amalgamation of the armies, the experiment may be regarded as successful. It is always desirable to abolish a theoretical anomaly, if the advantages which have resulted from the maintenance of a fiction can be retained in combination with a more intelligible and defensible system. India had been administered by an admirable body of public servants under the Company without any regard to political parties in England. The same exclusive devotion to Indian interests is fortunately found to be compatible with the direct authority of the Crown acting through a Minister who is called Secretary of State, and not, as formerly, President of the Board of Control. The result of the change in the form of Indian government is only one among many instances of the unavoidable misdirection of political anxieties. The French saying that nothing is certain but the unforeseen is but an epigrammatic and paradoxical exaggeration of the truth that experience never exactly corresponds with anticipation; yet it is a fallacy to assume that what has ceased to be important was not important in its time. One of the elements of the interest which attaches to Lord Lytton's speeches consists in the fact that, as a politician, he was not in advance of his age. His natural position was that of an intelligent bystander who thought that it became him occasionally to mingle in the fray of parties. The practical study of certain forms of human activity would have been less advantageously pursued if he had not adopted the tone and the point of view of his friends and his opponents. He may consequently be fairly accepted as a representative of some of the best qualities of his contemporaries. One of the ornaments of his oratorical or debating style is the uniform and unstudied courtesy with which he treats even the objects of his political censure. The severest of his speeches was directed against Lord John Russell on his retirement from Lord Palmerston's Cabinet after his abortive negotiations at Vienna. Even in commenting on an unexampled perversity of political conduct Sir Edward Lytton was careful to dwell on the great reputation and the political services of the fallen Minister. In every controversy Lord Lytton was a gentleman, and he was not a passionate partisan.

The Prefatory Memoir which forms the most interesting part of the present volumes is almost exclusively confined to Lord Lytton's political career. The limitation is judicious, because a son, even when, as in the present instance, he possesses all literary qualifications for the task, is not the fittest biographer of one of whose character he can neither think nor speak with perfect impartiality. The few expressions of opinion in which the present Lord Lytton indulges himself may be safely accepted as well founded. He is evidently right in attributing a large part of his father's success in life to his resolute industry. It is still more interesting to learn that Lord Lytton was extremely sensitive to

the thoughts and feelings of those around him. His son may possibly be mistaken in thinking that he cared little for praise bestowed on his intellectual ability. A score of prefaces and the entire series of his poems would lead to the belief that he cherished a not ignoble desire of literary fame. "Praise for any kind of moral goodness, the ready recognition of a generous motive or a lofty principle in his conduct, would almost overpower him; and I have frequently seen it bring tears into his eyes. Similarly he writhed under calumny, or any misinterpretation of his moral character. 'It is more than injustice,' he once exclaimed, 'it is ingratitude. Men calumniate me; I would lay down my life to serve them.'" To a certain extent his moral enthusiasm warped a literary judgment which ought to have been independent of ethical irrelevancies. A letter to Mr. Merivale, quoted in the Prefatory Memoir, affords a curious proof of the imperfection of Lord Lytton's æsthetic taste. In opposition to his accomplished correspondent, he argued that Schiller was equal or superior to Goethe, because in Lord Lytton's judgment Schiller exercised a more beneficial influence on life and character. "Just as if, if they had lived in the same day (and that day a serene artistic one), it would have been the question between Shakspeare and Milton—a question between width and height—Schiller preserves for us what is most valuable to men, the heroic standard." The comparison is founded on an utter misconception of the standard of poetic excellence. Shakspeare was a far greater poet than Goethe, and Milton than Schiller; but a critic who holds that Milton ever approached to the transcendent elevation of Shakspeare may not inconsistently compare the laboured declamation of Schiller with the spontaneous melody and the comprehensive imagination of Goethe. Neither Shakspeare nor Goethe devoted themselves to the task of preaching, and Milton's most elaborate sermon deviated into a glorification of Satan. Schiller wrote spirited verses with a high moral purpose, and he has his reward in the preference of those critics who prefer edification to the inspiration of genius. Engravings of illustrations of the Parables for the use of schools may perhaps convey more religious and moral instruction than as many paintings by Titian; but utility is but casually connected with beauty. By far the best of Lord Lytton's numerous fictions are those which have no professed moral purpose. In his later works his didactic efforts impair the value of stories which are happily for the most part conducted with little reference to the author's avowed and original intention.

GROVE'S CORRELATION OF PHYSICAL FORCES.*

TO those who know how busy is the life of a successful barrister it is a matter of wonder how so many members of the Bar can find time to render themselves eminent in subjects unconnected with their profession. Yet it would appear that the leisure which a judge may hope to enjoy is still smaller, for the tone in which Sir W. R. Grove presents to the world this republication of his contributions to science is so strikingly valodictory that it seems clear that he entertains no hope of pursuing original researches in the future. Not that he will be henceforth lost to science; rather he will there also be promoted from the bar to the bench, and will recognize and decide on the merits of scientific researches in which he may no longer take a part. In the full vigour of his intellect, it will be long before he ceases to be one of the foremost names in the catalogue of English physicists, and one of those whose opinions on scientific points will be most eagerly sought and listened to. And in these days, when the spread of the desire for scientific knowledge is yet more remarkable than is even the wondrous increase of that knowledge itself, such men are scarcely less needed than original observers. To gain credence among a large class of people one needs only to express one's speculations in sonorous scientific phraseology; two or three passwords such as "evolution," "conservation of force," and the like, are sufficient to give vitality to the most unsubstantial fictions of minds which find no difficulty in being original because they are too confused to be accurate. And even among better thinkers the race for priority of discovery leads to rash anticipations of possible results which, when presented, fail woefully to obtain the necessary support from the investigations which profess to have led to them. At such a time as this, men of great scientific power who, though they have their own triumphs in past days to recount, are not now engaged in any special branch of research, but content themselves with learning the results obtained by others, are specially useful. It is their recognition that distinguishes the true man of science from the charlatan; nay, if they will, they can prevent the more astute of our scientific men from intercepting the rewards and the renown due to the more retiring for the discoveries which they have been less eager to trumpet forth than to make; though this is a thankless task which few have the courage or the devotion to undertake. But to hold such a place in the scientific world it is necessary to have won your spurs in some actual field of scientific research, and not merely to have been a carpet knight who has contented himself with talking about the exploits of others. The republication by Mr. Justice Grove of his scientific writings, many of which were known but to a small circle, affords to all an opportunity of judging how far this has been the case with him.

So far as the general public is concerned, the book will gain greatly from the fact that the author has been an experimental and not a mathematical physicist. There are few papers in it which will not be readily understood by those who have a practical acquaintance with the contents of a laboratory; though, so far as most of them are concerned, such an acquaintance will be a necessary preliminary, if not to their being comprehended, at least to their being properly appreciated. It is true that such an ingenious speculation as that which purports to account for the formation of logan stones by the action of the weather is intelligible to all, but the majority of the papers are—as they should be—too technical in character for desultory reading, and will commend themselves only to those who possess a fair knowledge of the principles of physics and the general manipulation of physical apparatus. Fortunately this class is a large and ever-increasing one, and its members will appreciate highly the contents of this book. The exquisite adaptation of means to ends which marks the good experimenter is abundantly evident throughout; and there is moreover a spirit of caution in generalizing from results, and still more in accepting results as conclusive evidence of the theories they appear to support, which is in striking contrast to the general tone of the writings of many scientific men of great eminence. Such qualities fully account for the high reputation which Mr. Justice Grove has acquired, in spite of the limited leisure that he has been able to devote to the pursuits of science, and in spite of the fact that his papers on scientific subjects, even when collected, are not more than will easily fill a decent-sized volume. A very characteristic paper is the one on the effect of heat upon liquids, which relates to a series of experiments undertaken by him in order to ascertain whether the phenomena of boiling were duly accounted for by the ordinary theory that ebullition is due to the separation of the molecules of the fluid by the heat applied. These experiments led him to the conclusion that this explanation was far from being a satisfactory one, inasmuch as in all cases of boiling the fluid was not a pure fluid, but was mixed with some portion of permanent gas; and he ultimately pronounces in favour of the theory that ebullition is in reality due to the evaporation of the fluid at the surface of the small bubbles of permanent gas formed in the fluid by the action of the heat. These experiments were mainly directed to obtaining cases of boiling under circumstances which excluded the possibility of the presence of permanent gas; and after recounting the series of admirable contrivances by which he combated the difficulties that he met with, he proceeds to give a few remarks on the extreme difficulty of entirely isolating a substance from the surrounding air in a way that still permits of experiments being made on it. He sums up the results of his experience of the difficulty of obtaining and maintaining absolute purity of ingredients in refined experiments, in the quaintly expressed despairing utterance that "in nature everything is to be found in anything if we carefully look for it." Such controversies as those respecting the spontaneous generation of living organisms would not perhaps have had so chequered a course had the supporters of the theory held this in mind, nor should we have heard of the retort that spontaneous generation might be readily demonstrated by the use of judiciously dirty test-tubes. Not that this is the only case in which the cry of "crucial experiment" has been raised so often that we have ceased to heed it, or that the fault is by any means confined—either in that or in any other case—to the would-be discoverers of new truths. Want of scientific caution is prevalent in all schools of thought; it is a mental or moral weakness which belongs to the individual and not to the creed.

But, after all, it will be by none of the papers now for the first time republished that Mr. Justice Grove will mainly be remembered. Their practical results will, indeed, not be forgotten, and specialists will doubtless long continue to read them for the style and the accuracy of the thought they contain—an accuracy which we scarcely dare to impugn even in a single instance, though we cannot feel sure that a somewhat ambiguous passage in the paper on the Reflection of Light from incandescent surfaces does not speak of the interference of lights that are derived from different sources. But, like all such papers, they cease to be important when the information they give has become part of the ordinary lore of science. Far different is the case of such utterances as his well-known lectures on the "Correlation of Physical Forces," of which it has been well said that one can wish only a single word altered, and that is the all-important word "correlation." Such productions as these, which mark an epoch in the annals of science, never lose their value; nay, we may go further and say that their value is positively diminished by their being altered to keep pace with the advance of the lines of thought which they initiated. A grand generalization such as that of the identity of all forms of force, when once published abroad, is so suggestive that it speedily becomes useless to catalogue the exemplifications of its application that are supplied by various classes of phenomena, or the support it has received from subsequent experiments; and when it is once fully established, the sole interest that attaches to the early works which treat of it is not due to their scientific completeness but to their early date. And, above all, it is important to preserve as much as possible the exact form of the first announcements of such a generalization, and this for reasons far higher than mere antiquarian considerations. Nothing is more useful as well as more interesting than to contrast the wild and unsupported deductions that are drawn from such a generalization when once generally admitted with the cautious and guarded applications of it that were made by the original discoverer. The man who first ascertains the

* *The Correlation of Physical Forces*. Sixth Edition. With other Contributions to Science. By the Hon. Sir W. R. Grove, M.A., F.R.S., one of the Judges of her Majesty's Court of Common Pleas. London: Longmans & Co. 1874.

presence of gold in a country otherwise than by accident reads not let himself be enticed into stopping at particular spots however tempting, but follows steadily some course which must show him the presence of that which he seeks, if it be there at all. For to him the question is one of success or total failure, and without a certainty of gold being at all events near, it would be the madness of the unintelligent treasure-seeker to attempt mining at all. But the crowd that flock thither to avail themselves of his discovery feel no such restraints. To them it is but a choice of where to seek, and thousands will light on spots far richer than the one chosen by the original discoverer, yet which he had deliberately passed over in his research. Just so is it with the discoverer of a great generalization like those of the Correlation of Forces and Development. Many a follower of Grove and Darwin may have discovered more interesting instances and illustrations of the application of their great theories than did the discoverers themselves; and, if prescience be defined as the assertion of what is at the time unknown but will subsequently be found to be true, then have these disciples in their cheap and random prophecies often surpassed their masters in prescience. But it is not such exploits that science loves to honour. In her eyes the value of the advance made is not measured by the extent of country passed over, but by the difficulties of the path, and the meagre reports of the first man who has penetrated into an unknown land are far more precious to her than the detailed descriptions of the travellers who have jogged at their ease through the length and breadth of the land which his labours opened out to them. It is thus of the greatest importance that the text of works like the *Correlation of Physical Forces* should be kept as much as possible in their original form, and that additions should remain unincorporated therewith. For though, doubtless, the scientific world was nearing the discovery from more than one quarter, and though it may have occurred independently to other minds, yet the lecture which Mr. Grove delivered in 1842, followed by the course in 1843, may fairly claim to have been the first clear enunciation of the idea of the substantial identity of all forms of force. We would willingly have had these lectures in the form in which they were actually delivered, but this cannot now be, though some of the most important passages of the 1842 lecture are given in the preface to the present work. But, as a whole, we may feel certain that the identity has been preserved, for the author has confessedly been anxious to preserve it for reasons similar to those of which we have been speaking. And, as educated men in England, at all events, look to his *Correlation of Physical Forces* as the book from which they first learnt the now familiar ideas of which it treats, we may be sure that it will be long before it ceases to be treated with special favour, and it will be long before any rival work, however full or complete, will be more eagerly sought after than the book which taught so early and so well the unity of the forces of nature; a discovery of such vast and wide-reaching importance that even now we are but dimly conscious of its full significance. It needs but the complementary discovery of the unity of the material components of the universe—i.e. the demolition of the temporary and self-contradictory hypothesis of an ether which now disfigures science—to give to the dynamics of the universe the simplicity which Newton's great discoveries foreshadowed.

IDOLATRY.*

IF Mr. Julian Hawthorne's second book were not his second, one would be inclined to think far more highly of its author's capacities and probable future. His first work, *Bresson*, was full of extravagance, but full also of promise. His present performance cannot be said to fulfil that promise. That the younger Hawthorne is gifted with a power which, judged by the standard of ordinary novels, is great, cannot be doubted. Nor can it be doubted that he has misused that power. It is a common enough experience that the consciousness of strength leads its possessor into extravagance; and this can be pardoned in the case of a novice. The extravagance may be removed while the power will remain. Thus it is with the singer who is endowed with a strong voice. He will delight in producing a mere volume of sound until experience has taught him that natural force must be educated and tempered by art. Thus it is also with the young writer who feels that he has ideas beyond the general scope, and words apt to embody them. There is, unfortunately, this difference between the two cases. Were the singer to reject the experience of professors, and insist on trusting merely to his natural gifts, the experience of the public would soon convince him of his error. But to the mass of the reading public the most obvious want of training and attention to art in the making of a fiction appears to be no objection. It is enough for them if there are some touches of strength or originality in the book, some qualities which will bring a new sensation to their novel-jaded minds. Sometimes indeed it is enough if there are none. Whether this state of things indicates an increasing want of ideas among readers or writers or both, or whether it is more happily only a passing form of fashion, is a question capable of discussion. It is possible that it is an instance on a large scale of that extravagance springing from power which is exemplified individually in *Idolatry*. It is but a short time ago in the history of civilization that the capacity and taste for reading became universal. Perhaps

the indiscriminate greed for fiction is analogous to the chest notes which the scarce taught singer hurls forth. One effect of such a condition of affairs is that an author of any unusual ability can choose between the success of securing an immediate, if momentary, attention and the more real success which is dear to the true artist. Mr. Hawthorne has apparently chosen the former of these alternatives.

The lesser seems to have inherited the love which distinguished the great Hawthorne, of relieving the workaday aspect of the tangible world by casting over its actors and events a mist borrowed from realms fantastic, imagined, or even supernatural. He takes the same delight which his father did in imagining such combinations as might, so far as the laws of physics are concerned, take place in everyday life, but which as a matter of experience never do. He has the same perception of the fine irony of circumstances which was used with so much effect by the author of the *Marble Faun*. For the possession of these qualities, which are as likely to be inherited as imitated, it would be unfair to quarrel with the writer of *Idolatry*. It is not unfair to blame him for the use to which he has put them. The delicate impalpable veil with which the father was wont to hint rather than to establish a connexion between the real and the fanciful world becomes gross, and therefore incredible, in the hands of the son. Upon those doubtful points of eerie imagination which the father was wont to glide lightly by, as if half doubting their existence himself, the son makes an appreciable pause, and thus at once destroys his reader's belief. And as soon as the improbability of circumstances and characters hitherto unknown is made clear and manifest their charm is dispelled. Such a comparison as that which we have instituted would be unfair were not the likeness and unlikeness between the two writers so patent that they cannot escape observation. It is not only in the details of his work, but in its very essence, that Mr. Julian Hawthorne's too heavy hand produces a disagreeable impression. To build a romance upon utterly improbable events is the acknowledged privilege of the novelist, so long as he can decently disguise their improbability. When he chooses subjects which are not only unlikely, but also revolting, he exceeds his prerogative.

Mr. Hawthorne makes a considerable demand upon his reader's power of accepting the improbable at the very beginning of his book in the matter of one of its characters. This personage's first appearance upon the scene may be quoted as a fair specimen of the author's descriptive style, which at times rises to greater brilliancy and picturesqueness, but which in this passage has the advantage of not being disfigured by such phrases as "seem to glimpse his majestic figure," or "the air coloured (for "took the colour of") delicate pink." This character is discovered as an Egyptian boy of high rank standing upon the bank of the Nile, into which he plunges for a bath, thoughtless of currents:—

The subtle Nile catches him softly in his cool arms, dandles him, kisses him, flatters him, woos him imperceptibly onward. Now, he is far from shore, and the multitudinous feet of the current are hurrying him away. The slow moving boat is much nearer than it was a minute ago—seems to be rushing towards him, in spite of the laziness of the impelling breeze. The boy, as yet unconscious of his peril, now glances shorewards and sees the banks wheel past. The crowd of bathers is already far beyond hearing, yet, frightened and weary, he wastes his remaining strength in fruitless shouts. Now the deceitful eddies, lately so soft and friendly, whirl him down in ruthless exultation. He will never reach the shore, good swimmer though he be.

Mark! what plunged from the bank—what black thing moves toward him across the water? The crocodile! coming with tears in his eyes, and a long grin of serrated teeth. Coming!—the ugly scaly head is always nearer and nearer. The boy screams, but who should hear him? He feels whether the talisman be yet around his neck. He screams again, calling in half delirium upon his dead mother. Meanwhile, the scaly snout is close upon him. . . .

A many-voiced shout close at hand, a splashing of poles in the water, a rippling of eddies against the boat's bows! As the boy drifts by, a blue-eyed, yellow-bearded viking swings himself from the halvard, catches him, pulls him on board with a jerk and a shove—safe! The long grin snaps together in vain behind him. The boy lies on the deck, a vision of people with leg-coverings and other oddities of costume swimming before his eyes; one of them supports his head, and bends over him a round, good-natured, spectacled face. Above, a beautiful flag, striped and starred with white, blue, and red, flaps indolently against the mast.

Further on—

We catch imperfect glimpses of the Egyptian lad, steadily growing up to be a tall young man. He dresses in European clothes, and lives and moves amid civilised surroundings: Egypt, with her Pyramids, palms, and river, we see no more. The priest's son seems now immersed in studies; he develops a genius for music and painting, and diligently stores his mind with other than Egyptian lore. With him, or never far away, we see a person considerably older than the student, good-natured, whimsical, round of head and face, and insignificant of feature. Towards him does the student observe the profoundest deference, bows before him, and addresses him as "Master Hiero," or "Master Glyphic." Master Hiero for his part calls the Egyptian "Manetho,"—from which we might infer the latter's descent from the renowned historian of that name—but will not insist upon this genealogy. As for the studies, we fancy they tend towards theology; the descendant of Egyptian priests is to become a Christian clergyman! Nevertheless, he still wears his talismanic ring. Does he believe it saved him from the crocodile? does his Christian enlightenment not set him free from such superstition?

This conversion of an Egyptian youth into an American clergyman is curious enough. More curious still is the fact that he is adopted by an eccentric gentleman, the Master Hiero Glyphic of the passage just quoted, with a perfect craze for everything that is Egyptian, so that he builds an Egyptian temple out of one half of his house. Standing at an altar in this temple the Rev. Manetho Glyphic performs the marriage service for Thor Helwyse, an Americanized Dane, great of limb and voice, and Helen, sister to Hiero Glyphic, with whom Manetho is des-

* *Idolatry: a Romance.* By Julian Hawthorne. 2 vols. London: Henry S. King & Co. 1874.

perately in love. Most curious of all, however, is the attempt at portrayal of Manetho's character. With the malice and all but the capabilities of Mephistopheles he combines the patient cunning of Iago and the tender susceptibilities of Werther. It would be difficult to find a more impossible monster. Of this the author himself seems to have become in some sort conscious, for he has scattered hints throughout his story that the Rev. Manetho was more than a little mad. This is but a weak device, however, and rather increases than lessens the impossibility of the character. The author's intention seems to have been to produce a great effect by depicting a character full of hitherto unproved contrasts. The intention is neither ill conceived nor impossible of execution. But the author has failed to execute it. The means he has employed are too violent and inartistic. In contrasts of character there must be a certain coherence, just as in music there are certain discords which may, and certain others which may not, be properly employed. The author has resorted to a merely mechanical trick to heighten his effect by speaking of Manetho as "the clergyman" whenever he is employed upon any peculiarly fiendish piece of wickedness.

Far better drawn is Balder, the son of Thor Helwyse, Manetho's old rival. If he is not perfectly real, he is at least not perfectly impossible and monstrous. There is a brightness and cheerfulness about him which is an agreeable relief to the murky extravagance of Manetho and the solitary castle which he inherited from his old patron with the ridiculous name. Balder may be supposed to typify a form of modern faith or unfaith, as Manetho does one of older growth. The idolatry to which each of the chief characters in the book has given him or herself up takes in Balder Helwyse the form of an inordinate belief in self, springing from much successful dealing with the world, and the knowledge of the manners and cities of many men. From this idolatry Balder is converted by the softening influence of failure and trouble, just as the other personages are converted each from their own special worship in a special way. The representation of a character true and noble, but hardened by success into surpassing egotism, which is dissolved by an apt series of events, would be well enough. Only one seems to have read of a certain Raphael Aben Ezra, and a certain Tom Thurnall in the writings of Mr. Charles Kingsley, who have forestalled Balder Helwyse both in his egotism and his conversion. The parallel may of course be accidental. In that case we can only be as sorry for Mr. Hawthorne as Puff is for himself in the *Critic*.

Manetho's whole being after he has married Thor Helwyse to the woman whom he himself adores becomes absorbed in the idea of vengeance. This idea he proceeded to carry out by kidnapping, as he thinks, Balder Helwyse's twin-sister and carrying her off to his solitary castle. Here with a devilish ingenuity he conceives the plan of educating her so that she shall mistake good for evil and evil for good, and returning her to her supposed father when her education is complete. The latter part of this plan is frustrated by the death of Thor Helwyse, the former by the innate goodness of Gnulemah, by which remarkable name the girl is known. The study of a girl brought up entirely sequestered from all human influences save one, and that one of so appalling a kind as Manetho's, is a new idea, and here and there there are indications that the excellence of its execution will correspond to its novelty. The hopes raised by such indications are doomed to disappointment. The author manages always to fall short of the mark. If he failed altogether to approach it, the effect would not be nearly so irritating. This is one of the weaknesses of human nature which a writer should weigh well before setting himself a difficult task. He should remember that readers will have much less toleration for him who does that which is nearly good than for him who does that which is in no way good. In the latter case their attention is not seriously disturbed. In the former it is aroused only to be disappointed. That which most nearly approaches to goodness in this part of *Idolatry* is the first meeting between Balder and Gnulemah. What follows hard upon this—the supposed catastrophe on which the revenge of Manetho turns—is so horribly revolting that one is astounded at Mr. Hawthorne's dealing with such an incident in the pages of a romance. Mr. Leslie Stephen in his last book said, with picturesque terseness, "Poe was a kind of Hawthorne and delirium tremens." The latter part of the younger Hawthorne's book recalls this expression. The final and real catastrophe of *Idolatry* is a most lame and impotent conclusion, for which it is most difficult to assign any reason beyond the unworthy one of a desire to finish the novel with a startling effect. If such was the writer's object, he would have been wise to employ a less hackneyed incident.

There is one character in *Idolatry* described with a skill and delicacy which are almost worthy of the author of the *Scarlet Letter*. Unfortunately this character has nothing to do with the movement of the book, and is merely introduced as a picture by the way, so that it is possible to draw the inference that the success of the effort is due to its not being sustained. Mr. Mac Gentle was the president of a bank in Boston, and an old friend of Balder's father, so that Balder's first visit upon his arrival in Boston from Europe was for him. Why he was president of the bank nobody exactly knew, for no one ever paid any attention to his ideas on finance:—

Let no one hastily infer that the accomplished gentleman of whom we speak was in any sense a sham. No one could be more true to himself and to his professions. But, if we may hazard a conjecture, he never breathed the air that other men breathed; another sun than ours shone for him; the world that answered to his senses was not our world. His life, in short,

was not human life, yet, so closely like it that the two might be said to correspond as a face to its reflection in the mirror: actual contact being in both cases alike impossible. No doubt the world and he knew of the barrier between them, though neither said so. The former, with its usual happy temperament, was little affected by the separation, smiled good-naturedly upon the latter and never troubled itself about the difficulties in the way of shaking hands. But Mr. Macgentle, being only a single individual, perhaps felt lonely and sad. Either he was a ghost or the world was. In youth he may have believed himself to be the only real flesh and blood; but in later years the terrible weight of the world's majority against him forced him to the opposite conclusion. And here at last were he and the world at one!

Suppose, instead of listening to a description of this good old gentleman's person, we take a look at him with our own eyes? There is no danger of disturbing him, however busy he may be. The inner retreat is very small, and as neat as though an old maid lived in it. The furniture looks as good as new, but is subdued to a tone of sober maturity, and chimes in so well with the general effect that one scarcely notices it. The polished table is mounted in dark morocco: behind the horse-hair-covered arm-chair is a grey marble mantel-piece, overshadowing an open grate with polished bars and five utensils in the English style. During the winter months a lump of Cannel coal is always burning there; but the flame, even on the coldest days, is too much on its good behaviour to give out a very decided heat. Over the mantel-piece hangs a crayon copy of Correggio's Reading Magdalene, the only touch of sentiment in the room, and that perhaps accidental!

The concrete nature of the President's surroundings is at first perplexing, in view of our theory about his character. But it must be evident that the world could never provide him with furniture corresponding to the texture of his mind; and hence he would instinctively lay hold of whatever was common-place and non-committal. If he could realize nothing outside himself, he might at least remove whatever would distract him from inward contemplation. There is, however, one article in this little room which we must not omit to notice. It is a looking-glass, and it hangs—of all places in the world—right over Mr. Macgentle's standing desk, in the embrasure of the window. As often as he looks up he beholds the reflection of his cultured and sad lined physiognomy, with a glimpse of dusky wall beyond. Is he a vain man? His worst enemy (had he one) would not call him that. Nevertheless, Mr. Macgentle takes a pathetic comfort in this small mirror. No one, not even himself, could tell wherefore; but we fancy it to be like that an exile feels in seeing a picture of his birth-place, or hearing a strain of his native music. The mirror shows him something more real, to his sense, than is anything outside of it.

There is another passage in the book which we are tempted to quote in order to show that Mr. Hawthorne has capacities for humour and observation which he would do well to cultivate, in place of the ill-ordered fantasies which he has indulged in. Helwyse, thinking that he has killed a man in a struggle, has his beard shaven off by a little barber as a measure of precaution. The barber asks him if he has ever attended camp meetings:—

"No?" continued the little man, who, by long practice, had acquired a wonderful knack of interpreting silences: "Well, it's a great thing, sir! and a right curious thing experiencing religion is, too! A great blessing I've found it, sir; there's a peace dwells with me, as the minister says, right along all the time now. Does the razor please you, sir? Ah! I was a wild and godless being once, though always considered smart with the razor; Satan never took my cunning hand, as the poet says, away from me. Yes, there was a time, sir, when I was how-d'y'-do with all the bloods around the place, and a good business I used to do out of them too, sir; but religion's a peace there's no understanding, as the good Book says, and if I don't make all I used to, I save twice as much, and that's the good of it, sir! Beau-ti-ful chin is your's, sir, I declare!"

"Do you believe in the orthodox faith?" asked Helwyse: "in miracles, and the Trinity, and so forth?"

"Everything we're told to believe in I believe, I hope, sir; and as quick as I hear anything more, why, I'm ready to believe that also, provided only it comes through orthodox channels, as the saying is. Ah, sir, it's the unquestioning belief that brings the happiness: I wouldn't have anything explained to me—not if I could! and my faith is such that what goes against it I never would believe, not if you proved it to me in black and white, sir. Lovely skin, yours, sir—just like a woman's! The intellect is a snare, that's what it is.—Ah, yes! You think with me, sir, don't you?"

Were the whole of Mr. Hawthorne's work equal in merit to the two extracts which we have made, we might rejoice in the advent of a new writer of romance. As it is, we can only be sorry that he did not put away *Idolatry* for a year or two before he thought of publishing it.

GENERAL SHERMAN ON WAR.*

GENERAL SHERMAN'S name in his profession would be sufficient excuse for his offering his opinions on it. No other commander, always excepting Lee, attracted so much attention by his achievements during the great American Civil War. The dogged perseverance and relentless energy of Grant, the power which he had, and indeed occasionally misused, of pushing on his men, his long and complicated campaigns on the Mississippi and Tennessee—these were less fitted to win him fame than such a stroke of genius in strategy as that which accomplished the famous march across Georgia, or even the not less difficult feat of pushing such a general as Johnston, bent on obstinate defence, step by step back, for the hundred miles that brought the invader into the heart of the South at Atlanta. Should the work ever appear of which the essay now published in American journals is declared to be the final chapter, we may be sure that it will be read with almost as much interest in Europe as in the writer's own country, even did not this fragment prove abundantly that General Sherman knows how to describe as well as to teach, and has an observation not less keen in deducing military lessons from experience than in seizing the strategical features of a tract of country or the important points of a battle-field.

* *The Military Lessons of the War.* By W. T. Sherman, General of the Army of the United States. Being the concluding Chapter of an Unpublished Memoir of Events of the War.

words which are as applicable to the story of the French at Gravelotte, lately told by us from the Moltke Narrative, as to any event that the writer witnessed. As to discipline, we read:—

In camp, and especially in presence of an active enemy, it is much easier to maintain discipline than in barracks in time of peace. Crime and breaches of discipline are much less frequent, and the necessity for courts-martial far less. Too many of these in any command are evidences of poor discipline and inefficient officers.

On the disputed question as to the choice between telegraph, hand-signals, and messengers, the General's authority may be held almost decisive from his extraordinary experience:—

For any army covering a large space of ground the magnetic telegraph is by far the best, though habitually the paper and pencil, with good mounted orderlies, answer every purpose. I have little faith in flags and torches, though we always used them; because almost invariably when they were most needed, the view was cut off by intervening trees, or by mist or fog—

an opinion by the way coinciding exactly with that of the best practical officers on this side of the Atlantic. Our next and last extract will be found to bear on our own War Office system, and might almost seem to have been written expressly to criticize it:—

Commanding officers of divisions, departments, and posts, should have the amplest powers to command not only their troops, but all the stores assigned for their use, and the officers necessary to administer them, and then with business they could be held to the most perfect responsibility.

It is almost needless to say that here is the very remedy that our soundest military thinkers have pointed out for the evils of the present local dualism caused by the adoption of a crude copy of the great French Intendance blunder in our own Control. But the whole of this essay teems with practical wisdom put in a easy and agreeable form. It deserves study wherever the fu-preading tongue is spoken of which the author is hardly less master than of the sword; for he has gathered for us into a single chapter the rich experience of some of the most instructive campaigns in which men of our own race have ever followed a worthy leader to victory.

KOLDEWEY'S ARCTIC EXPEDITION.

THIS handsome volume contains the record of the German expedition to the East coast of Greenland in 1869-70; and it appears appropriately enough at a time when the interest in Arctic discovery has been stimulated by the news of the earlier results obtained by Weyprecht and Payer. Of the merits of the book considered from a purely literary point of view there is not very much to be said. The story is told pleasantly and modestly, as befits men who are recounting their own exploits. It is far from easy to give any great freshness to accounts of adventures which necessarily are but a repetition, with trifling variations, of incidents familiar to all readers of Arctic travels. After describing the drift of the *Hansa*, indeed, "the narrator" tells us rather quaintly "that he closes this account with the hope that he has succeeded in rendering these extraordinary adventures, which must always be unique in their kind, interesting to the reader." We suppose him to mean that this kind of adventure is unique, and not, as his words would naturally imply, that these special adventures were unique; for the drift of the *Polaris*, to mention no other case, is another and more striking example of a kind of adventure not uncommon in Arctic discovery. At any rate the account is certainly interesting to people who are not tired of the ordinary set of phrases about flocks and bergs, and the other technical terms of the Arctic vocabulary. We must add that the book has one odd peculiarity; it is a kind of joint-stock production. Nominally it is by Captain Koldewey, assisted by members of the scientific staff; it is translated by Mr. Mercier, and edited by Mr. Bates. Captain Koldewey, however, is the author of a comparatively small part of the whole book. And everywhere the narrative changes without the smallest notice from one author to another in a manner which would be rather perplexing if it were necessary to discriminate between the different shares. "I" and "we" alternate without obvious reason. "The party to which I belonged," as we are suddenly told, "consisted of three—Dr. Borgen, the sailor Kleutzner, and myself." We have not the least intimation as to who "myself" may be; but at the end of this fragment of narrative it is incidentally remarked, "So much for Dr. Copeland and his party." In the next paragraph another party is described as "they"; and afterwards the story melts into "we." The names of the authors of each chapter are given in the table of contents; but a little indication in the text might be convenient. The variation is really of no importance, though in reading a book, as in carrying on a conversation, one rather likes to know the name of one's interlocutor. We must fancy that we are sitting in the cabin of the *Germania* listening to the yarns spun by various members of the expedition, each striking in at his own fancy, and not stopping to explain to us his personality. On the whole, though the book might have been advantageously reduced within a smaller space, we have no great cause for complaint. After all, when people have spent a whole winter in the Arctic Ocean, they have in some sort a right to bore their hearers with a rather excessive detail of small incidents, though they would do wisely not to make too free a use of their privilege.

The general outline of the expedition is simple enough. The

Germania and the *Hansa* sailed in company on the 15th of June, 1869. After a rather troublesome voyage they were on the edge of the pack ice off the East coast of Greenland on the 20th of July. Captain Koldewey, the chief of the expedition, signalled to the *Hansa* to come within hail. Captain Hegenmann of the *Hansa* misunderstood the signal to mean that he was to go to the westward. The consequence was that the two ships separated in a fog and never saw each other again. After a good many struggles to escape, the *Hansa* was finally blocked up in the ice on the 2nd of September. According to the usual practice a hut was built on the ice in the neighbourhood of the ship, to which stores were removed in case of accident. The ice drifted rapidly to the South, carrying the ship with it, and with October bad weather and furious gales set in. On the 18th and 19th the ice began to move ominously and crush the sides of the ship. At last the ice raised the bows of the unlucky *Hansa* high out of the water, whilst the stern remained immovably fixed in the solid mass. The result was that the ship was hopelessly damaged, and gradually foundered when the ice separated. All the provisions that could be saved were removed to the hut; and there the crew remained drifting slowly southwards through the winter months, hoping that their floe would hold together until they could launch their boats in open water. Their privations seem to have been considerable. Violent storms blew which threatened to crush their place of refuge amidst the chaos of contending blocks of ice. Gradually the area of the little ice island diminished, and the current frequently threatened to crush them against large icebergs stranded near the coast. They seem to have borne their sufferings with abundant cheerfulness, and some of the remarks which they make are rather oddly characteristic of the differences between English and German sentiment. We do not think at least that many English sailors would be found who would confide to their journals such a poetical sentiment as is quoted from the "day-book" of one of the German sailors. Describing the strange sounds of the Arctic night, he says:—"We listen—who is it? All still! not a breath stirring! Once more it sounds like a lamentation or a groan. It is the ice; and now it is still, still as the grave, and from the pale glance of the moon the ghostly outlined coast is seen, from which the giant rocks are looking over to us. Ice, rocks, and thousands of glittering stars. O thou wonderfully phos-like night of the North!" But, however different the mode of expression, no English sailors could have behaved better than these sentimental Germans, who solace their hours of seclusion by composing poetry and reading Heine's songs. One peculiarity of the East coast of Greenland appears to be the immense number of bears. Both the *Germania* and the *Hansa* seem to have been besieged by these animals, and some very awkward adventures followed. One of the scientific gentlemen was carried off by a bear, who chewed him a great deal, and especially tried to crack his skull. This, it seems, is the proper mode of killing a seal; but either the skull of a German savant is harder than that of a seal, or the bear in question was not full-grown. Anyhow, the sufferer fortunately escaped with life, and, favoured by a strong constitution, recovered completely from his wounds. He adds that he did not feel the smallest pain either at the moment of the injury or in the process of healing.

To return, however, to the crew of the unlucky *Hansa*. On the 7th of May, after two hundred days of drifting, they were able to desert their faithful floe and take to the boats. Provisions were short, and they suffered a good deal from hunger. "It is a peculiar and very mixed feeling," says the narrator, "to think that in six weeks we shall have nothing to eat; if then we have not reached the land we must drop off one after the other; but, serious as is the thought, there are times when it seems irresistibly comical." This comic view of the situation was apparently facilitated by the fact that these excellent Germans had plenty of tobacco. At last, on the 13th of June, they reached Friedrichsthal, a station of the Moravian missionaries; and there the more serious part of their journey ended; though they describe at rather excessive length the period which intervened before they could finally take leave of Greenland and set sail in a Danish ship for Copenhagen, which was reached on the 1st of September. Ten days afterwards the *Germania* ran into Bismarckshavn, and heard of the escape of their comrades.

The career of the *Germania* had been more prosperous. She had succeeded in breaking through the ice and reaching the part of the Greenland coast which had been visited in 1823 by Clavering and Sabine. A convenient harbour was found in Sabine island, and a series of sledging expeditions, carried on with great energy, enabled the travellers to make a considerable addition to our knowledge of the geography of the region. Lieutenant Payer seems to have specially distinguished himself, and to have gained much of the experience which he has since turned to good account in a still more adventurous expedition. Alpine travellers may take a certain pride in his performances, for his name was already well known as an explorer of the Eastern Alps before he undertook to climb mountains and cross glaciers in the far North. His Alpine experience was turned to good account in the ascent of greater elevations than have hitherto been reached by Arctic travellers. The most remarkable discovery of the expedition was the Kaiser Franz Joseph's Fiord, which runs very deeply into the Greenland coast at about lat. 73°. It was discovered just at the end of the season, and its full investigation is therefore left as a task for some future explorers, but enough was seen of its wonders to stimulate our curiosity. Its course could be traced for about forty miles, and it is bordered by a series of peaks rising to above 9,700 feet.

* The German Arctic Expedition of 1869-70. London: Sampson Low & Co. 1874.

One "monstrous pyramid of ice," estimated at 11,000 feet in height, deservedly received the name of Petermann. Payer himself climbed a point 6,850 feet above the fiord, and gives an animated description of the wonders of the scenery. Here, he says, "were congregated all the peculiarities of the Alpine world; huge walls, deep erosion-fissures, wild peaks, mighty crevassed glaciers; raging torrents and waterfalls, which in Europe as a rule, come but singly. All these pictures of wild beauty were taken in at a glance." After climbing a colossal rock, at least 5,600 ft. in height, which was christened (if that be not a rather inappropriate word) the "Devil's Castle," he adds:—"Never in the Alps have I seen anything even approaching this in grandeur. Here a diminutive Matterhorn rose straight from the water; there rushed a huge mass of water from some glacier over the great walls deep down into the clear water below." The description shows some of the natural enthusiasm of a first discoverer; but we are quite ready to believe that the district has its claims. It is, indeed, rather barren and solitary. There is more vegetation than might be expected; some birch trees even rise to a height of from two to three feet; and in sheltered places attain "even a greater height than this." Moreover there are a good many reindeer, so that the pleasures of slaughter may be added to those of beautiful scenery. Surely this should be a temptation to some adventurous Englishmen to follow in Payer's footsteps and gain the glory of genuine discoverers by ascending some of these wild peaks, from which a view may be obtained into the still untrodden wilderness of the interior of Greenland.

We will not, however, follow the travellers further. It is impossible not to feel a certain shade of jealousy in reading these accounts of daring adventure, skilfully carried out. The expedition which has just returned shows that German enterprise is capable of extending the limits of our knowledge still further. Surely Englishmen should not allow themselves to be beaten in the race, or, more disgracefully, to retire from the competition without making an effort. Though jealousy is an evil passion, so far as it prompts any tendency to detract from the merits of our rivals, we may allow it to stimulate us to a fair effort to keep on a level with them. We would fain hope that these records of German travel, which have sent a thrill of excitement through the whole of the Fatherland, may prompt us to show by unmistakable proofs that the spirit of the Franklins and Parys is not altogether extinct in England.

RUSSIAN ADVANCE EASTWARD.*

THE Khanate of Khiva at this moment resembles one of those recondite and unpleasant subjects in a competitive examination which only the most audacious and speculative candidates take up. And the answers to the questions therein involved exhibit a considerable diversity of merit. The Englishman produces a series of animated sketches. A laborious and erudite German like Baron von Hellwald, collates and exhausts all that previous writers have said on the matter, and condenses their information into something which may claim to rank as a standard work of reference. From the Hungarian Professor and accomplished Orientalist comes the note of warning to England; from a nameless Russian, the apology for the Czar; from a dauntless American, a record of perilous adventures commenced with energy, prosecuted with forethought, and terminated with complete success. Every competitor, in forecasting the issue or dissecting the problem of Central Asia, has hitherto added something to the general stock of our knowledge. The present volume, we are sorry to say, is an exception. It tells us very little that we did not know before. It is unenlivened by any touch of humour or spark of imagination. The author is painfully accurate with regard to a number of petty details which few would care to read and fewer still to remember, while he displays no sort of capacity for generalization, and little power of appreciating the political bearings of the very events which are passing under his eyes. The work is at once official, pedantic, regular, and icily null. It is scarcely an excuse to say that this work ought to be judged by a bureaucratic standard, the author having written in the character of an officer accredited to the Czar's expedition by the German Emperor. A Special Commissioner delegated by the Viceroy of India to a similar force exploring the Steppes of Turkestan or fathoming the bed of the Oxus would, we venture to say, have turned out something very dissimilar in point of diction, anecdote, illustration, and even hard and dry facts.

The compilation, didactic and guarded as it is, has, however, one merit. The author does not meander away into scores of paragraphs. One hundred and thirty pages comprise all that he has to say, or that the translator has thought it worth while to communicate. Indeed, the editor and translator, Captain C. Howard Vincent, appears to have had some doubts whether the work was worth attention at all, and he has accordingly expanded this production by reprinting a lecture on the Russian army which he himself delivered at the United Service Institution, and which contains a great deal, not generally known, on the organization and discipline of one of the largest armies in the world. We shall deal with this presently. But, first, let us dismiss the Imperial *attaché* himself. A political officer selected to accompany a compact force groping its

way to a remote Oriental capital, through sands and nomad tribes, ought, we should have fancied, to be a man familiar with at least one Oriental language—Arabic, Turkish, or Persian. Lieutenant Hugo Stamm, as far as we can make out, has not even an elementary acquaintance with any one Aryan or Semitic dialect, and he is constantly devising new combinations of letters in the transcript of Eastern names. Shere Ali, the well-known ruler of Cabul, becomes Syr Ali; Khula or Kala Ata is metamorphosed into Chula-Atka. We may be tolerably sure that the correct name of the Prime Minister of Khiva is not Mak-Murat. The summer palace of the Governor-General of the Caucasian provinces has been given by other travellers as Borjome, and not Borschom. The title of the uncle of the reigning Khan may very probably be Amir-al-Omra or "the Prince of Princes," *Amra* being the Arabic plural form of Amir. Lieutenant Stamm talks of "his uncle, Emir-Omra," as if this were a real name and not a well-known honorific addition. It is possible that some of these vagaries may be due to the process of translation; but blunders they are, and it would not require the attainments of M. Vambéry or Mr. Palgrave to avoid or correct them. It is also somewhat difficult to identify the Mohammedan month Jumadi-al-Awl in the Teutonic adaptation Djumadi-el-Afvel.

To do the author justice, he seems to have been occasionally impressed by the peculiarities of the country, the scarcity of water, the endurance of the troops, and the skill and capacity of the leaders. But he lacks the power to put himself graphically on paper, or to see anything but musty official data. The following are the items which he extracts from the diary of one of the colonels as "interesting":—

May 21, 2 A.M.—Left Alan. 8 P.M. reached Irbassan well. Eighteen miles. Water salt and almost undrinkable.

May 26.—To Kungrad, seventeen miles. Fresh spring water.

A tendency to manufacture sensational paragraphs out of the most ordinary incidents of a march in the desert, to drag in the weary camels sinking down to perish in the sand, or the obedient Russian soldier delirious from thirst and sunstroke, is doubtless reprehensible. But the dry details accumulated by Lieutenant Stamm, without any word of explanation, graphic touch, or instructive and seasonable comment, are just as much to be deprecated from their barren and tasteless uniformity. Remarks on the fauna or flora, the geology of the country, the dress, manners, and peculiarities of the inhabitants, there are few or none. By way of compensation we have lists of stores allotted to the forces detailed with a precision which would satisfy the newest broom that ever swept a Commissariat Department, or the most rigid accountant that ever watched over excess of expenditure. The stores of salt, the corns of pepper, the bottles of essence of vinegar, the bushels of oats, the amount of dried cabbages and red onions, all are given as if the prospects of the author in the service depended on his mastery of such minutiae. Once or twice the Teutonic phlegm and official reserve of the writer give way to something that may be styled excitement. When he has passed the desert he speaks of the "green fields and fragrant pastures," the "lovely little lakes of clear blue water," and the "banks clothed with the beauty of spring, and swarming with the sweetest of plumed songsters." But this only leads him to think that he must be in "a fairy kingdom," or that he has been, something like Nick Bottom, "transferred by magic to the Warriors' Walhalla of the Arabs." How a Scandinavian myth should correctly describe the sensuous Paradise of the true believers, this imaginative German does not explain. We really prefer his dry official scraps to his flights of fancy; and we can only hope that, if ever another delegate is selected from a host of officers of the high standard of intelligence and education which characterizes the Prussian army, the choice may fall on some one who is more gifted with the capacity to discern and depict those salient points which have been turned to such capital account by the lively Correspondent of the *New York Herald*.

The second part of the volume contains far more matter for instruction and thought. Having emancipated the serfs, the Russian Emperor very properly began to reform his army. To this end he divided his vast Empire into fifteen military districts, and his administration into twelve bureaux or departments. He proclaimed the liability, with certain exemptions, of every adult male to serve either in the regular army or in the militia or local forces; and in time of peace he brought the cavalry and infantry together in divisions, and the artillery, engineers, and rifle corps in brigades. The conscripts, we learn, undergo a preliminary training of six months, after which they are appointed to regiments. From May to October they are sent out to practise campaigning in tents. After six years a conscript is free from regimental duty, and, if he desires it, may be drafted into the reserve. During the long winter months great pains are taken with his education, and he is lectured periodically on the military art. The non-commissioned officers are brought up to a higher standard, and forced to study mathematics, geography, and field fortification. The food does not seem to be at all on a par with the curriculum, and it is marvellous how the Russian soldier can cheerfully endure the hardships and submit to the discipline of his career on black bread, a few scraps of meat mixed with rice and sour herbs, and *quass* or *kwas*, a sour beverage which you must be intensely national or cosmopolitan to swallow. The advocates of the system of purchase in our own army might have found some unexpected support for their views in the lecturer's comments on the difficulty of officering the Russian troops. A squirearchy does not exist in Russia. That class is there wholly wanting which could send to a military career a yearly comple-

* *Russia's Advance Eastward*, based on the Official Reports of Lieutenant Hugo Stamm, German Military Attaché to the Khivan Expedition. By C. E. Howard Vincent, F.R.G.S., Captain Royal Berks Militia, &c. London: Henry S. King & Co. 1874.

ment of gentlemen of moderate means, patrician sentiments, and unblemished descent. Other professions—law, literature, and commerce—are already beginning to assert their claims. The calls on the scientific branches of the army are also very numerous, and military engineers, in Russia as in India, have been distributed all over the country to superintend the construction of roads, railways, and bridges. Another disturbing element is the admixture of German officers. They are so able that they cannot be spared, and so numerous that they are a source of some anxiety. A parallel to this state of things is easily conceived if we only imagine the Indian army to be in part officered by the descendants of warlike Sikh Sirdars or haughty Mohammedan Vizirs and Nawabs. Attempts to establish regimental messes do not appear to have met with much success; and Captain Vincent is bold enough to challenge the popular belief in the great linguistic attainments of Russians. They have, he says, a difficult language of their own, and are thus enabled to command and imitate the accents of all other tongues. Officers of the Guards, the cavalry at least, nearly all speak French, and many German, though few can write either language grammatically. But in the line "it is a great exception to meet an officer conversant with a foreign language." Then the pay is wretched; and to make up for want of solid pudding there is abundance of showy decoration and empty praise. Ribbons and orders glitter on the breasts of captains who have never faced a hostile battery or "seen a shot fired in earnest." At the same time it is pretty clear that the service is not unpopular, and that a good and healthy feeling exists between privates and officers. Macaulay, in describing the composition of the army of the Commonwealth, when saints sometimes served under sinners, remarks that it would not be prudent in our time for a private to lead the devotions of his less gifted colonel, or to admonish a backsliding major. But what would the historian have said had he read the account, as given by Mr. MacGahan, of the soldiers tossing their Grand Duke into the air and receiving him in their uplifted arms, with every token of undiminished respect and affection? Apparently a kind of filial dependence on others seems to characterize the relations of the private and the peasant in that huge Empire. And there is no reason to doubt that the army contains a good deal of excellent raw material, and something beyond it. Soldiers who can make tremendous marches and thrive on food which would reduce others to skeletons, who can use the hatchet, the needle, and the cooking-pot, who can march out eighty miles from the capital and back again in mid-winter by way of exercise, while the thermometer is a little above zero, who stand heat like Sepoys, who rarely mutiny, and never grumble, will never be despised or underrated as foes. They may truly say, like the soldier in Lucan,

Solstitio Meroen, brumâ tentabimus Istrum.

But we share the lecturer's belief that, for some time to come, military details, improvements in arms and machinery, and the completion of imperfect communications, will give Czars and generals quite enough to do, without committing themselves to further schemes of open aggression. We can safely recommend this lecture to those who desire more information about the Russian army than we have space to give.

As for Lieutenant Stumm, we may, in conclusion, remind him that, though Herodotus refers to certain documents which showed the quantity of garlic and rations consumed by the Egyptian workmen who built the Pyramids, his history does not altogether owe its popularity to such matters. His reports remind us of a certain personage who in former days invariably sprang up in the wake of Indian armies, to supplement the slender stores of officers by selling, at exorbitant prices, creature comforts, such as brandy, beer, mixed biscuits, sardines, soup, tooth-brushes, and jam. This speculator, sometimes a Parsee, sometimes a Mohammedan, invariably turned up whenever wanted, at the siege of Mooltan, at the occupation of Lahore, in Bundelkund, or in the track of the avenging squadrons during 1858. The author's odd lists of stores, which we doubt not are as correct as care can make them, suggest to us nothing so much as the miscellaneous assortment of an "Indian Boxwalla" humbly following in the rear of the men who crossed the Oxus and virtually dethroned the Khan.

THE MAGIC MIRROR.*

ON reading Mr. Longfellow, sweet hard, with such a thrill of pleasure throbbed Mr. Molony's heart as to make him resolve that he "joyfully would other themes discard for [Mr. Longfellow's] enchanting art." The result is a good-sized book of metrical compositions, which certainly differs in some respects from most of its kind that we have seen. It touches on a reasonably sufficient variety of themes, and between the text and the notes one may perhaps find grounds for a pretty shrewd guess as to how much the world has lost in the other themes which Mr. Molony has discarded.

The piece which comes first in the volume and gives a name to it is a poetic vision of things in general. The vision is of the kind which suggests l'Intime's question in *Les Plaidours*, "Quand aura-t-il tout vu?" In this case the answer is, at the end of forty-four pages and nine lines over. Next comes another long poem entitled "The Pilgrim Fathers," which also very soon runs

into things in general. We find a little physiology, a little physical astronomy, and a little metaphysics. The two former come out better in the notes, and may wait till we recur to them there. As for the metaphysics:—

There is no time; what seems so is ideal,
Mere shadow of events that come and go.

This is a paradox, and seems to us,
Whose minds are finite, an absurdity.

Some pages further on we learn that the custom of nailing horse-shoes on thresholds "shows a deep knowledge of electricity in our Pagan sires." As at this point we have to make an extract of eighteen lines, it will save a little space and afford a wholesome exercise to our readers if we leave them to make out Mr. Molony's blank verse for themselves:—

They tell us also spirits never cross the water: this is a superstition based on the same principle; this fluid being a great attractor of the electric fire. The parable about the unclean spirit that walketh through dry places seeking rest—that is to say, through places without water, such being the true translation of the Greek—doubtless refers to a like superstition. So strongly were our Saxon ancestors given to such absurd credulities, that they passed a law inflicting penalties on any bishop, who, administering the holy sacrament, should be so drunk as to allow it to drop into the fire, or into a river—fire and water being of light the absorbing agents. Many more such superstitions could I here relate.

The scrupulous refinement of Mr. Molony's Greek scholarship has perhaps made him a little too severe on the translators of the Authorized Version. It is not given to every one to understand the importance of distinguishing accurately between dry places and places without water. Of course for some purposes dry does not mean without water, any more than bald means without hair; as, for instance, when we apply the epithets dry and bald to certain collections of words so put together that they appear to be intended for blank verse. The next piece that calls for attention is a didactic one on the "Decay and Fall of Empires," written as near as Mr. Molony can make it in the proper didactic manner:—

Say, Muse! such is the question I propose,
And may thy help the true reply disclose—
Say, Muse! why nations of the mightiest sway
Decline and fall—how comes this sad decay?

We naturally find a telescope described as an "optic tube" and a "searching glass"; a great many lines beginning with *What, Why, Perhaps, and Perchance* (of these last there is a whole page); and a panegyric on something which "here at the plough exhilarates a Burns. . . here fills a Franklin's soul with musings deep, there a (thiotte *sic*) midst his browsing sheep," and after performing divers other feats *here and there*, "inspires a Newton in an apple's fall." But as these fragmentary specimens may not give a just notion of the poem, we must cite as a further example the description of the Chinese Empire:—

Behold the empire of the strange Chinese!
Much to attract, but little still to please—
The doctrines of Confucius, great and sage,
May throw some lustre upon history's page;—
The industrious habits of the people, too,
Present a striking and most pleasant view;
But China, like her neighbour, bears the seeds
Whose fulsome harvest is a crop of weeds:
By factions torn, to ruinous ill a prey,
Her powers collapse, and hasten to decay!

Presently we come to a long story in verse on the Irish famine, which marks the influence of the "sweet bard" on Mr. Molony by closely imitating the metre and manner of *Hiawatha*. The scene is in a village where Catholic priest and Protestant parson live together in wonderful amity:—

Often times along the margin
Of the darkly-shining river
Would these friends be seen together,
Walking, arm-in-arm, together—
Link'd in friendship as in person—
Link'd in mind and soul together—
Never were a nobler couple
In relation to each other
Than this goodly priest and parson
Walking thus in sweet communion,
In the course of conversation,
They would talk of bards and sophists—
Of the lights of olden ages—

Likewise in their social rambles
Would they talk of bards and sophists
Who have lived in later ages—
Of Erigena, the world-famed—
Galileo, and Copernic—
Bacon, Locke, and glorious Newton—
Kepler, Arago, and Herschel—
Cuvier, Franklin, and Linnaeus—
Milton and the bard of Avon.

We also hear that "their walks were full of pleasure" because they always remembered to look at pebbles, insects, and flowers; but the pleasure they had in star-gazing takes a stanza to itself:—

But if such these good men's feelings—
If such were their inclinations
In the humble paths of Nature,
In the commons of kind Nature—
How supremely grand their feelings,
How sublime their inclinations,
When their lofty thoughts would wander
Through the spangled vault of heaven
To the peopled orbs of glory!

* *The Magic Mirror, and other Poems.* By Henry Molony. Published for the Author by Cameron & Ferguson, Glasgow and London. 1874.

Further on we come to a panegyric in blank verse on Milton, to whom Mr. Molony exclaims, "Methinks that all the minds of gifted men, combined and for that purpose brought together, could not produce a mind to equal thine." Three pages more, and Mr. Molony competes with Milton in describing Adam and Eve in Paradise. The piece is given as from an unfinished poem, so that possibly Mr. Molony is preparing to compete with the whole of *Paradise Lost*. Presently he goes to see Tintern Abbey, and his reflections on it culminate in the following stanza:—

Methinks some magic fay hath call'd
Thy fabric with her wand,
And form'd thee thus, O Ruin bald!
Majestically grand!

There is another poem of considerable size which is dramatic, and in three acts; it is about a painter who killed his wife and was duly convicted, but (in an epilogue) "freed, by clemency of the Crown, from th' ignominious end." We have not quite succeeded in discovering for what style this is meant. There is much lyrical dialogue of good and evil spirits; in fact, on a cursory view, we should say the spirits talked as much as the men and women; but there are several distinct sources from which this machinery may have been taken, and we cannot find anything to guide our conjectures to any particular model.

This may suffice for the English poetry of the volume. But as Mr. Molony's ambition is not confined to one style, so it is not confined to one dialect or one language. There is one ballad in a kind of mis-spelt jargon which is meant for old English, and there are several in something which is meant for Scotch. But we must pass over these for the sake of Mr. Molony's French, which affords a really curious study. We are inclined to doubt whether "all the minds of gifted men, combined and for that purpose brought together," could have produced in sport anything to equal that which Mr. Molony has produced in sad earnest. The first quatrain in the series of French poems will do as well as any to begin with:—

Séjour de délices, séjour de mon enfance,
Enfin je revois ton ciel si serein,
Mais dans ton encante est une autre engeance—
Un monde étranger se niche dans ton sein!

It strikes one instantly that this is not French verse, nor anything like French verse. The next thing is to find out what it is; on what plan it is in fact constructed, and how it appears to the author to be verse. This, though not quite so obvious, comes out on a little consideration. Fortunately Mr. Molony has put the matter beyond all doubt by printing one poem in two recensions, the first as he wrote it, the second "as altered by an eminent French poet," who has altered it in the manner and to the extent that an Eton master alters a boy's Latin—that is, so as just to make it scan and construe. Here is a specimen of the work as turned out—may we say in Eton phrase in the "foul copy" ?—by Mr. Molony, and afterwards in the "fair copy" by the French poet.

The original:—

Le temps coule, mes amis! l'instant de la vie
Est d'une vue circonscrite de bien et de mal;
Le passé est le songe d'une nuit d'insomnie
Et le futur est l'ombre d'un destin égal.

As corrected:—

Mes amis, le temps coule et l'instant de la vie
Est un rayon borne par le bien et le mal;
Le passé, songe amer, une nuit d'insomnie,
L'avenir est son ombre, en tous maux son égal!

This shows conclusively, first, that Mr. Molony's lines are meant for the regular French Alexandrine; and, secondly, that he does not see the point of the corrections, as otherwise he would hardly have printed his own first copy. The key to this metrical puzzle is now tolerably plain. Mr. Molony simply does not know the difference between English and French prosody; he thinks an *e* mute in French is the same thing as a silent *e* in English, and is in the same case with the gentleman who some time ago wrote indignantly to the *Times* to ask what the telegraph clerks meant by charging for *impératrice* as five syllables. The way to reproduce the effect of French verse on Mr. Molony is therefore to drop all the mute *e*'s and read with a strong English intonation. The French Alexandrine is thus transformed into a lilting English ballad metre, and Mr. Molony's stanza scans (to him) in this fashion:—

Le temps coull' | mes amis | l'instant | de la vi'
Est d'un' | vû' | circonscrit' | de bien | et de mal'
Le passé | est le song' | d'un' nuit | d'insomnie'
Et le fu | tur est l'omb'—(or om' | bro?) d'un dés | tin égal.

(The accents here of course mark the metrical beat, and we have suppressed the French acute accent where it occurs in order to avoid confusion.) Any one who will now take the trouble to read the corrected stanza in the same way—

Mes amis | le temps coule | et l'instant | de la vie—

and so on, will easily see that on this plan the metrical effect of the two is undistinguishable. We have actually thirty pages of these compositions, and towards the end of them the author innocently remarks:—

D'ailleurs, en effet,
Le Français n'est pas mon fait;
Ma patrie est l'Irlande,
Et de "Shamrock" ma guirlande.
Je ne songe pas, mes amis,
D'y ajouter "Fleur-de-Lys."

The use of the French language, at least in verse, certainly does not seem to be Mr. Molony's calling. We have seen only one thing to match these performances, and that was an English poem

written by a German innkeeper who seemed to have learnt the language through the medium of French. Instead of thinking with Mr. Molony that French prosody is the same as English, he took English prosody to be the same as French, so that he duly counted ten syllables in each of his lines, but left the distribution of accent to take care of itself, allowing the accentual stress of each word, which indeed for him had no existence, to fall in any part of the line at random.

It only remains to give some specimens of the miscellaneous themes which have not been discarded from Mr. Molony's notes. The notes treat of divers things, as of politics:—

I saw another man, &c.—P. 38.

Though I cannot help pitying Louis Napoleon in his adversity, yet there was undoubtedly much in his character to call for animadversion.

Of philosophy:—

Are not our eyes the suns to light our bodies—
Our minds the inward suns to light our souls.—P. 50.

Many philosophers have confounded the mind and soul together, considering them as identical.

Although there can be no doubt of their intimate connexion, yet I believe them to be different essences. The Romans appear to have made a distinction between them, calling the mind "animus," and the soul "anima," thereby giving to the one a masculine and to the other a feminine designation, and from the conjunction of both proceeds "ingenium," the innate principle "reason."

Of science:—

There can be no better proof of the circulation of the blood by electricity than the fact that the application of a piece of iron down the back stops spontaneous hemorrhage from the nose, the attraction of the iron arresting for the time the electric fluid. The principle may be exemplified by making water drop through a small capillary syphon, which the moment it is electrified runs in a full stream.

By such means
Has the old orbit of the Earth been changed,
Her greater weight having drawn her from the Sun,
So that those lands where once was torrid heat
Are now submerged by constant ice and snow.—P. 54.

It may be objected to this theory, that though the matter which constitutes our globe has undergone many changes, yet that there has been no actual increase of matter, and that its specific gravity consequently remains the same. To this I reply, that our globe was once covered with water (as is evident from the researches of the geologist), that all bodies are light or heavy according to the quantity of the electric fluid which they possess; that the bulk of water having been much larger formerly than it is at present, the electric nature of the water caused our globe to have a levity such as it has not at present, nor has had probably for many thousands of years.

The science is further supported by etymology; the French *feu*, substantive (= *focus*) and *feu*, adjective (*feu*=*fau*=*fatutus*), being in Mr. Molony's eyes the same word:—

Let us look, for instance, at the French word *feu*—fire—in the common idiom, "feu Monsieur —," "feu Madame —," &c., "the late Mr. —," "the late Mrs. —," &c. Now the word *feu*, as used in these and similar expressions, originally meant "in the spirit," or as "me," with which element, or, properly to speak, "light" or the "electric fluid," the ancients confounded and identified the soul, and therefore, also, the ghost or spirit of the departed.

In one place Mr. Molony exclaims:—

My pretty Muse! why dost thou haunt me so?
Why dost thou fill my bosom with such pain?
How often have I said that thou shouldst go!
How often have I vowed, but vowed in vain!

Why the Muse should so haunt Mr. Molony is of a truth one of those questions that are sooner asked than answered, and we agree with him that she uses him very hardly. The book, we observe, is published "for the author." It would seem, therefore, that so far *non concessere columnas*; but we hope we have shown that it would be at least misleading to speak of Mr. Molony as a middling poet.

LINDSAY'S HISTORY OF MERCHANT SHIPPING.*

UNTIL now no attempt has been made to write the history of shipping and of navigation upon anything like the scale upon which it has been undertaken by Mr. W. S. Lindsay. The two ample volumes which he has just published form, we are given to understand, only an instalment of the full and exhaustive work which he has set himself to write. Reserving for the two future volumes a narrative of the more important events and changes which have taken place in his own time with regard to the constructive arts and the legal or commercial interests connected with the sea, he has brought down to this point a comprehensive history of the art of building ships and the growth of maritime enterprise from the earliest periods to which the records of the past can be traced. Blending with his own practical knowledge of the subject the results supplied by the learning of well-read friends, among whom Mr. Vaux and Sir Patrick Colquhoun are particularly mentioned, he has brought together a mass of valuable material which has hitherto been widely scattered, and accessible only with difficulty, as well as much sensible criticism upon disputed points of fact or inference. The early years of his life spent abroad have qualified him to correct many an error into which men of reading have been betrayed by the lack of what experience alone can supply. His anxiety to treat his subject with absolute completeness is, in fact, rather oppressive, for he even carries his thoughts back

* *History of Merchant Shipping and Commerce.* By W. S. Lindsay. In 4 vols. Vols. I. and II. With numerous illustrations. London: Sampson Low & Co. 1874.

to the primary idea of flotation, from our first parents having noticed leaves or branches of trees floating in the river which went out of Eden to water the Garden. From speculations of this kind it is some relief when he passes to the Deluge, though there is nothing more than common-place in his treatment of the Ark, nor does he venture upon any critical use of the light thrown upon the tradition of the Flood by the recently discovered Assyrian record. Familiar as Mr. Lindsay seems to have made himself with the ordinary sources of Oriental and classic lore, including the researches of Continental scholars like Berghaus and Jal, he has scarcely gone at adequate length or depth into the history of navigation in its scientific aspect. Of the instruments in use from the earliest to quite modern times he takes but the slightest notice. Of the use of the compass, whether among the Chinese or any other race before the twelfth century of our era, he is rightly, we believe, incredulous. But the sole instrumental aid to navigation of which he takes occasion to speak is the gnomon, for measuring latitude by the sun's shadow. He does indeed quote from Sir John Chardin the use of the forestaff and quadrant by native pilots in the Indian and Persian seas; but he is strangely silent as to the astrolabe, an instrument which may be traced to early Eastern and Greek antiquity, and which is invested with special interest to Englishmen by Chaucer's curious treatise, the earliest work of science in our language. As a whole, however, it is impossible to speak too highly of the industry which Mr. Lindsay has bestowed upon the collection of his materials, or of the judgment he has shown in the decision of doubtful questions.

There can be little doubt that the chief commercial routes were at the earliest periods overland. Including as he does the history of commerce at large, Mr. Lindsay extends his researches to the traces of land intercourse between the nations of Europe and both Asia and Africa, especially the great caravan routes by which East and West interchanged their varied produce. Long previously to anything like authentic history, there are traces of this intercommunication. In implements of the Bronze period, for example, the presence of tin has been thought to point to an intercourse as far East as Baku, in the Straits of Sumatra, where the ore is found in abundance, as well as in the British Isles, though these may have formed its principal source. The Sanskrit word for tin, *Kastira*, so like *castoreum*, which has no equivalent in either the Semitic or the Greek family of languages, may be taken as some proof of the knowledge of the metal having passed, carrying the name with it, from East to West. It is in connexion with this metal, moreover, that the earliest traffic by sea is to be traced; the enterprise of the Phœnicians leading them along the coasts of the Mediterranean to Spain and the Isles of Britain. Theirs were the first regular colonies or depôts of shipping, and by them were the more useful of the less conventionally precious metals of Western Europe, both copper and tin, brought to minister to the luxury of the East. Mr. Lindsay's carefully prepared map shows at a glance the leading routes by sea and land which the earliest authentic notices make it possible to lay down. Indian and Chinese records render it probable that long before the dawn of Greek literature, possibly prior to the Mosaic records, the products of those regions found their way by more than one path over the lofty passes and steppes or burning deserts to the markets where Africa and Europe, as well as Western Asia, were prepared to barter their wares. Gold and silver, precious stones, spices, and, above all, perfumes in what seem fabulous bulk, ministered to the vanity, the luxury, or the religious pomp of Nineveh, Babylon, and Thebes, or of the courts and temples of Hebrew and Syrian kings. What we read of Joseph's boyhood bespeaks the existence of an itinerant traffic of this kind, which is instanced later on by the spoils of the Midianites captured by Hideon. At the most flourishing period of this interchange of merchandise, five principal caravan routes may be said to have divided the traffic of Arabia, the coasts of the Levant, and Northern Africa. By the first of these Egypt and Palestine interchanged their wealth. The second extended from the coast of Syria, including the trade of Phœnicia with Babylon and Assyria, through the plains of Mesopotamia to the North, and along the shores of the Red Sea to the South. The third traversed Asia Minor to the North; and the fourth route lay through Africa, with Thebes as its centre and the Nile and ports of the Red Sea as its outlets. In later times Petra and Palmyra became important entrepôts for the immense trade of Yemen, and the then fertile tract between the Arabian and Persian Gulfs which were not long to remain "Ilappy." The seasons for the arrival and departure of these caravans, the arrangements for their sustenance and safety, the skilful equipment of the camels and other beasts of burden, with the rate of travel and modes of disposing of the multitudinous merchandise, will be found set out in detail in Mr. Lindsay's earlier pages.

It was not, there is reason to believe, till the knowledge of the monsoons was reduced to a system by Hippalus, in the reign of Claudius, that long and regular voyages across the Eastern seas became practicable for mariners, who had previously been restricted to coasting the continents, or making short stretches from island to island. But long ere this authentic reports are in our hands of expeditions and ventures by sea which bespeak the skill and daring of the early mariners of Greece, Phœnicia, and the far East. To the voyage of Nearchus, the most systematic and complete of these narratives, our author has given fresh interest by telling how he, when a young commander, took his ship closely along the track of Alexander's captain, verifying his

account of the intricacies of the navigation between the mouths of the Indus and the head of the Persian Gulf, having repeatedly to anchor, like his Greek predecessor, through the night. It is true that it took Nearchus five months to do what a sailing-vessel of modern times can do easily in three weeks, and a steamer in far less time. And in this contrast lies the significance of well nigh the whole revolution in the art of navigation which it is Mr. Lindsay's object to narrate. The history of that art is the history of science, and the value of this book consists in the able sketch the writer has given of the successive steps by which the construction of vessels and the art of guiding and impelling them have advanced from their rudest beginnings to their most recent stage. His practical experience of both teaches him to speak, not only with respect, but with admiration, of what was done by the builders and navigators of centuries long anterior to our own. He goes the full length of belief in the substantial truth at least of the reported wonders of the Ptolemies and of Hiero in naval architecture. The race whose remote ancestors built the Pyramids and the Labyrinth may well have launched the ship described by Athenæus, from Callixenes the Alexandrian—two hundred and eighty cubits long, carrying three thousand sailors, besides a host of fighting-men between decks, and impelled by four thousand rowers, although her depth was more probably eight-and-twenty than eight-and-forty cubits, as the story has it. According to Plutarch this ship, like the *Thalamegus*, another floating monster of the Ptolemies, more gorgeous and luxurious in fittings, was a mere huge barge moored in the Nile or some great lake or canal for purposes of show or pleasure. The great war ships of Demetrius were however, he remarks, really of service, and Hiero's great ship, for which trees enough were cut from Mount Etna to have built sixty triremes, which had twenty banks of oars, and carried a freight of sixty thousand measures of corn, ten thousand jars of Sicilian saltfish, twenty thousand talents weight of wool, and as much of miscellaneous cargo besides, may have been able, Mr. Lindsay believes, to make voyages in perfect safety both to Greece and Alexandria. To the construction of these, and of the manifold other forms of shipping spoken of by early writers, he has given patient study, carefully working out the mechanical problems involved in framing, equipping, and, above all, in propelling them. Great ingenuity is shown in his chapter upon the management and working of the oars in galleys of many banks. No vessel had, he considers, more than five horizontal rows, all galleys above the quinqueme being rated by counting their oars obliquely. Thus is explained Ptolemy's tesseractemer, in which the oars amounted to four hundred on the uppermost tier, with fourteen rowers to each, the number diminishing to six rowers on the lowest deck. The length of the upper oars was, according to Athenæus, not less than fifty-seven feet, and they required to have lead sunk into the handles by way of counterweight. The oarsmen, on the upper tiers at least, would probably walk one or two steps forward, and thus throw themselves with the greater impetus back into their seats at every stroke. That music or the beat of the drum was frequently used to keep the oarsmen in time is expressly stated by many writers. No great difference in principle is to be traced in the Venetian, Genoese, and other row-galleys, or in those in the service of our own sovereigns down to the great constructive change in the English navy under Henry VIII. The early prowess of England upon the sea, long before the Norman invasion, and its gradual development under succeeding reigns, is minutely drawn out by Mr. Lindsay, whose descriptions are aided by woodcuts such as that of the galley "Subtile" from the Roll of the King's Gallies, 1546, and the famous "Harry Grace à Dieu," which, however, had been beforehand outdone by the "Great Michael" fitted out under James IV. of Scotland, but afterwards sold to the King of France. This last is described by Lindsay of Pittscottie as 240 feet in length, employing all the wrights in Scotland, and using up all the oaks of Fife, save Falkland, carrying 300 marines, six score gunners, and 1,000 men of war; her cost, besides that of her artillery, being 30,000*l.* The impules given to English shipping under Elizabeth, and the exploits both of traders and freebooters, as well as the gallant efforts for the defence of the realm, receive, we need scarcely say, due justice at our author's hands, and he has availed himself of State papers and other original data in addition to the published materials. Not less full or careful is his narrative of the great Genoese, Venetian, and Portuguese discoveries of the fifteenth century, though the subject is not so open to fresh or original treatment.

To ordinary readers perhaps the most novel and striking part of Mr. Lindsay's book will be that in which he refers to the origin of England's first Shipping Code, the germ of that legislation which has of late years grown to such portentous dimensions and assumed such embarrassing intricacy. It was no doubt to the exigencies of the large and widespread enterprise thrown open for the first time by the Crusades that this primitive body of regulations owed its formal introduction. By the earlier school of antiquaries, like Selden and Coke, they have been deemed of English origin and due to Richard I. The learned work of M. Pardessus has more recently shown that they were based upon more ancient enactments, in part upon the so-called Rhodian laws, but that in the main they belonged to the ancient French code known as the "*Rôles or Jugemens d'Oléron*." Sir Harris Nicolas, relying upon Brompton, Hoveden, and others, states that Richard drew up at Chinon, on his way to Marseilles, these earliest Articles of War. A memorandum of 12 Edw. III. (A.D. 1284), quoted by Sir Travers Twiss in his edition of the *Black-Book of the Admiralty*, asserts that these laws, the last ten

articles of the Rôles, "were by the Lord Richard, formerly King of England, on his return from the Holy Land, corrected, interpreted, and declared, and were published in the island of Oleron, and were named in the French tongue (Gallica lingua) 'La Ley Olyroun.'" There is no evidence that Richard himself ever went to Oleron. In his appendix Mr. Lindsay cites from the Harleian MSS. six Ordinances of King Richard (A.D. 1192) concerning (1, 2) "Sleigers of men on shipboard and on land," (3) Brauling, (4) The punishment for blood-dwraing, (5) Revilers, (6) "Theft and Pickerry," corresponding to some extent with articles of the Code, which are in all forty-seven. The enactments of the Code refer to the duties of master and seamen, to salvage and averages, to demurrage, bottomry, flotsam and jetsam, to the fisheries, and in particular to wrecking and piracy, against which the severest penalties are laid down. The lord of any place who permits and assists in such villainies is to have all his goods confiscated and sold for the benefit of the injured parties, and himself to be fastened to a post in the midst of his own mansion-house, "which being fired at the four corners, all shall be burned together; the walls thereof shall be demolished, the stones pulled down, and the place converted into a market-place for the sale of hogs and swine only, to all posterity." Bishops and prelates participating in such crimes were to be deprived of their benefices. At a later period the merchants of Wisby, in the island of Gothland, framed their laws upon the Oleron Code, which became the recognized rule for deciding all maritime controversies, not only among the Hanse Towns, but among all nations in the Baltic. The frightful increase of piracy during the long contest between Henry III. and his nobles called forth stringent measures, and for the first time a Lord High Admiral, by name Topham, was appointed. Liverpool about that time became known as a place of maritime trade. English adventurers, long known as the "merchants of the staples of England," first opened trading establishments in the Netherlands and elsewhere abroad, the formation of the Hanseatic League (A.D. 1241) adding much to the commercial advance of Henry's reign. The freedom of the wool trade and the opening up of the Newcastle coal-fields for export abroad marked the reign of Edward III., by whom a roll of the English fleet was for the first time prepared, on the occasion of the attack on Calais, the ships previously employed, and even at this time, having been mainly vessels of commerce supplied by the different trading ports. The fleet fitted out by Henry V. at immense cost for the invasion of France, regardless of the remonstrances of Parliament, was a great advance upon previous armaments. The wisdom of England in keeping up the command of the Channel, seldom more strikingly vindicated, is asserted in the curious contemporary poem the "Dominion of the Sea, or Libel of English Policy," printed by Hakluyt, with extracts from which our author enlivens his page. It was about 1416 that the formal claim to lordship over the sea was put forth by the Commons, though as far back as the reign of King John the penalty of forfeiture was entailed upon every vessel that would not strike or veil her "bonnet" to a king's ship in token of sovereignty. Side by side with the warlike prowess of the nation went on the spirit of commerce and discovery. The advantages derived from intercourse with foreign countries were best seen by the merchants of England, and in time became the foundation of much of her prosperity and greatness. Our author's sympathy with liberal measures makes it a pleasure to him to trace the progress of her maritime greatness in proportion as her legislation advanced in enlightenment and width. Coming down to later times, he can dilate with pride on the repeal of the restrictive laws on navigation, with the result which he had throughout anticipated, of an unexampled expansion of British shipping and commerce. Nor has he less satisfaction in pointing to what has been done both by public enactment and private spirit to promote the safety and well-being of the seaman. As an owner of shipping on no small scale, he might say much of what he himself has done to grievances such as he himself experienced as an apprentice. No historian of seafaring matters from our day forward will, we may be sure, have to draw a picture of life between decks such as Mr. Lindsay found it fifty years ago. It is with good right that he has undertaken the task of chronicling the maritime and commercial greatness of his country.

CICELY.*

"AS long," says the author in the motto to this novel, "as Love continues the most imperious passion, and Death the surest fact of our mingled and marvellous humanity, so long will the sweetest and truest music upon earth be ever in the minor key." There would be more truth in this if it generally happened that the certainty of death and the power of love affected us in all their force at the same period of our life. To the lover sighing like a furnace many things seem far surer than that

Last scene of all
That ends this strange eventful history.

When all the world is young to us, though we acknowledge as our major proposition that all men must die, yet we are slow in fitting that major with its proper minor, that we too are men. If a man is young and healthy, and as yet ignorant of the fact that he has to digest as well as to eat his food, though he will be ready enough

before long to acknowledge, if he does not indeed already acknowledge, that love is the most imperious passion, yet he will not find his pleasure in music in the minor key. The author might indeed bring in proof of her statement the melancholy of the lover's lute. We should in that case be curious to know if the melancholy of the drone of a Lincolnshire bagpipe depends also on the power of love and the certainty of death. Music in the minor key may at the present time, for all we know, be held the sweetest and truest. But the day has been in the world's history when lovers were not so sad as either a gib cat, or a lugged bear, or an old lion. We ourselves, though Plancius's consulship is long since past, still like a good old-fashioned love-story, where there were cruel fathers and other difficulties enough, but no one thought of dying except some rich old bachelor uncle, whose fortune, left to his nephew or his niece as the case might be, made all things straight. The surest fact of our humanity is, we should have said, that we are alive. Should any novelist come to trouble our idle hours with death, we would say, with a slight change in Mistress Quickly's words, We hope there is no need to trouble ourselves with any such thoughts yet.

Miss Ennis Graham—we think we can scarcely be wrong in assuming that the story before us is written by a woman—is happily not so melancholy in her story as in her motto. The right people do in the end marry, though if they had done so half a volume sooner it would have been better both for them and the reader. The story is fairly interesting as stories go. Had it been a good deal shorter it would have been still more interesting. Cicely, the heroine, when the story opens, is engaged to her cousin Trevor Fawcett. The reader has no expectation, however, that the marriage will ever come about; for in the first place the hero is a young doctor, Mr. Guildford, and he must of course, both as a hero and still more as a doctor, marry some one, and in the next place, quite at the beginning of the story, Mr. Fawcett, in driving at a great pace a pair of horses in a French watering-place, knocks over a beautiful young lady. This young lady, Geneviève Casalis, by one of those strange coincidences in which novelists delight, turns out to be Cicely's cousin. It would, we think, save a great deal of trouble, whenever it happens that an unmarried gentleman of fortune, in driving rapidly round a corner, upsets a pretty girl, if he were either to kill her off on the spot, or else were at once to recognize the decree of fate, and offer to marry her as soon as the doctors have set her on her feet again. Mr. Fawcett does neither one thing nor the other, and in consequence has nearly three volumes of trouble to go through. He scarcely indeed makes the acquaintance of Geneviève at the time, and leaves for England altogether ignorant that she is related to Cicely. The magnificence of his appearance had made, however, a great impression on Geneviève, and "she was quite satisfied that he was already over head and ears in love with her." Before long she has an invitation to visit her English cousins, and starts off for Methven Abbey. Much about the same time that Mr. Fawcett introduces himself to Geneviève by running over her, Mr. Guildford first meets Cicely at the deathbed of her little nephew. It would be a curious speculation which of the two gentlemen of the story has the greater advantage in his first introduction to the lady whom he is afterwards to marry. Geneviève, during the first weeks of her stay at the Abbey, is not informed of her cousin's engagement. Unless she was to be represented as thoroughly bad, it was necessary that she should look upon Fawcett as unengaged. Nevertheless, the author in this part of her story finds herself a good deal perplexed, for it was contrary to all probability that the engagement should have been concealed. When at last an explanation is given, all that Cicely can say is as follows:—

"I thought you would more readily feel at ease with me if you did not know that I was going to be married. I seem older than I am, and I fancied anything of that kind would have made you feel as if I were very much older than you. That was my only reason for not telling you. And besides, there seemed no particular reason for speaking of it immediately—at that time I had no idea that I should be married for a year or two years to come."

Geneviève, knowing then nothing of the engagement, and naturally enough thinking that a man who had almost driven over her must be in love with her, looks forward to an early marriage with this rich English gentleman. Fawcett, who is a weak, good-natured fool, meaning all the while to be faithful to Cicely, pays nevertheless far too much attention to her cousin. To keep the balance true, the doctor on his side should have been courting Cicely; but he, unfortunately, had started in life with the theory that "the grandest women make splendid friends. Women's influence," he was ready to admit one day in speaking to Cicely, "has certainly done all you say, but it has seldom been the influence of wives." Geneviève does, indeed, at last learn of the engagement, to her great indignation and despair. No one, however, has any suspicion of her attachment to Fawcett. A grand bull is given, and there, as Cicely, dispirited with her lover's neglect, sits in the conservatory, she overhears a conversation between him and Geneviève which shows her that she is loved no longer. She returns home to find that her father has died of a fit, and died a ruined man. At the same time Mr. Guildford, who had come to entertain less philosophical views about women, had left the neighbourhood in the full belief that Cicely was before long to be married to Fawcett. He went off to India, and was not heard of again for a long time. Never was heroine in a more pitiable condition—her father dead, her mother not far from death, the family estate to be sold, her lover faithless, her cousin treacherous, and the young doctor, who alone would have been worthy of her, gone

* *Cicely: a Story of Three Years.* By Ennis Graham, Author of "She was Young and He was Old," "Not without Thorns," &c. 3 vols. London: Tinsley Brothers. 1874.

off no one knew where. Sir Thomas Fawcett, Trevor's father, when he hears that his old friend Colonel Methvyn had died a ruined man, is only the more eager that his son should marry his daughter. His only fear is lest she, in the pride of poverty, should now refuse to marry him:—

"You may take my word for it, Trevor, if things are as bad as I fear, Cicely will be proposing to break off with you."

Mr. Fawcett had risen from his seat, and was tramping up and down the room. He did not wish his father to see how exceedingly he was startled by this fresh view of matters. Cicely to give him up! And why? Because she was no longer rich, could no longer bring Greystone as her dowry—Cicely, his dear old friend and playmate, his promised wife—could he accept such a release? Cicely rich, he had come to think, or, to fancy he thought, that she did not care for him, that she was cold and indifferent, that she would be glad to break with him—he had excused his own weakness and folly by such specious arguments, and had tried to think he believed them. But Cicely poor!

"No," he said to himself, "if this is true, not all the Genevièves on earth should persuade me to give her up. Was there ever in this world such a fool as I have been? But still, if this is true, my course is clear."

Cicely of course refuses to have him, and reproaches him not so much with his treachery towards her as towards Geneviève, whom he would now desert. She insists that he shall marry her cousin, and herself brings about the match. If only that unlucky philosophical doctor had not started off for India, he might, after a decent time of mourning, have had a chance of testing his theories about splendid friends and the influence of wives. Unhappily for him, the necessities of the third volume required his absence. He reads "in some fashionable record of 'arrivals in town' the names of Mr. and Mrs. Fawcett from Burnstay Castle," and at once jumps to the conclusion that Mrs. Fawcett is Cicely. The long period which he consequently had of unwedded life was perhaps a fitting punishment for wasting his time in reading the *Morning Post*.

Meanwhile the death of Mrs. Methvyn affords the author an opportunity of once more delighting the reader with music in the minor key. Cicely goes off to France to visit her cousins at the watering-place where the pair of horses worked her so much mischief. There it so happened, by a second, and this time a blessed, coincidence, that Guildford came to recruit his health after his stay in India. He was being nursed by his older sister, a widow. The reader does not see very much of her. She is nevertheless one of the best drawn characters in the book. Early in the story she was arguing against her brother's resolution not to marry and his theories about friendship. He had maintained, on the authority "of a very wise person," that we should descend a step in choosing a wife, mount a step in choosing a friend:—

"It's a very nasty, mean, spiteful saying, whoever said it," said Bessie wrathfully. "It's just that men are so jealous that they can't bear their wives to be thought more of than themselves. Who said it, Edmund?" she went on looking rather frightened as an idea struck her. "It wasn't Solomon, it isn't in the Bible, is it?"

There is a happy touch of humour in the stroke about Solomon and the fear that she may have unawares been condemning something that is in the Bible. By the time, however, that we have now reached in the narrative there was no fear that the authority of Solomon should be invoked against matrimony. Guildford was willing enough to marry, but the end of the third volume was still, we suppose, too far distant. He takes it into his head that Cicely prefers a certain parson, and leaves for England without speaking out. In fact, he would never have got married at all had not her sister turned up from India. She, being a woman who cared, we should imagine, very little for music in the minor key, convinced no doubt that the surest fact of our mingled and marvellous humanity is a comfortable match, seeing, too, how the land lay, quickly brought the hero and the heroine to an understanding. Guildford owns that his theories were all wrong, and ends by saying:—

"Yes, I understand it now:

'Sole spark from God's life at strife,
With death, so, sure of range above
The limits here.'"

We should understand him all the better if in his quotation the stops had not been sprinkled about as if from a pepper-box.

AMERICAN LITERATURE.

A FEW months ago we noticed the first volume of the *Memoirs of John Quincy Adams*, sixth President of the United States. We have now to invite attention to the second volume*, comprising Mr. Adams's diary while representing his country at the Court of St. Petersburg and negotiating the treaty that ended the war of 1812 between England and America. On the 5th of August, 1809, Mr. Adams set sail from Boston in a private sailing vessel belonging to that port on a voyage direct to the Russian capital. Nothing of interest happened until he entered the Sound, but there he had an experience of that annoyance of which the United States were then so loudly complaining, and which ultimately led to the war of 1812. England and Denmark, it will be remembered, were at war, and British ships were in consequence closely blockading the Danish coasts. When Mr. Adams entered the Sound, he was brought to by two men-of-war, his vessel was boarded

by an English captain, and the crew mustered on deck for the officer's inspection. The appearance of one of the sailors, as it happened, did not correspond with his description in the ship's papers, and the captain consequently threatened to carry him off to serve on board his own vessel. However, he did not execute his threat. But as the men-of-war had strict orders to allow no vessel to pass through the Sound, the officers felt themselves in a difficulty regarding Mr. Adams, whose diplomatic character entitled him to special consideration. The matter was referred to the decision of the Admiral, and by him the American Minister was suffered to proceed on his pledging himself not voluntarily to enter a Danish port. But there was danger that the Danes might seize the ship for having intercourse with the blockading squadron. On the contrary, they behaved with much civility, allowed Mr. Adams and his party to land, and visit Copenhagen, which he found suffering severely from the effects of the blockade. At length, after a tempestuous and dangerous voyage of seventy-five days, the first envoy ever accredited by the United States to the Court of St. Petersburg reached his destination in safety. He was received with marked favour by the Czar, and in one of his first interviews with Count Romanzoff, the Imperial Chancellor, the Count with undiplomatic frankness let out the secret of the gratification of the Russian Court at the appointment of a regular resident Minister by the United States. After much conversation of no special interest, Count Romanzoff stated "that the English exclusive maritime pretensions, and views of usurpation upon the rights of other nations, made it essential to them, and especially to Russia, that some great commercial State should be supported as their rival, that the United States of America were such a State, and the highest interest of Russia was to support and favour them, as by their relative situation the two Powers could never be in any manner dangerous to each other." We have quoted this passage in full as throwing light on the origin and motives of the strange friendship which has since subsisted between Russia and the United States. At the time Mr. Adams reached St. Petersburg France was at the zenith of her power, and it was the policy of the Russian Court to affect great zeal for the closest possible alliance with Napoleon. Hence every opportunity was taken to pay court to his representative. Mr. Adams records several striking instances of the homage rendered to Caulaincourt, Duke of Vicenza, then Ambassador of France at the Court of St. Petersburg. For example, at a Court ball given in honour of the Czar's birthday, we are told that much anxiety was felt by the other Ministers to ascertain whether the Empress and the Grand Duchess Ann would dance with the Austrian Ambassador. "They did not. They danced only with the French Ambassador, and he only sits at the Imperial table at supper." Again, at a dinner given by the Austrian Minister in honour of his master's birthday, the Emperor Francis's health was drunk in champagne, the company all rising from table. Before sitting down, Count Romanzoff, the Imperial Chancellor of Russia, addressing himself, across his host, to the Ambassador of France, drank to the health of his master. Mr. Adams observes upon this that the dinner was given solely in honour of the Emperor Francis, and that, at a similar dinner at the French Ambassador's, Count Romanzoff would never think of toasting the Austrian sovereign. But the alliance between the two Courts was now drawing to a close. Soon rumours began to spread of differences and disputes, and after a while Count Romanzoff himself spoke freely of the danger of war. On one occasion he related to Mr. Adams a highly characteristic anecdote of Napoleon which we do not remember to have before seen in print:—"The Count shook his head, and said, 'No; it is impossible. Tranquillity is not in his nature. I can tell you in confidence that he once told me so himself. I was speaking to him about Spain and Portugal, and he said to me 'I must always be going. After the Peace of Tilsit, where could I go but to Spain? I went to Spain because I could not go anywhere else.' And this," said the Count, "was all that he had to say in justification of his having gone into Spain and Portugal." But although on this and some few other occasions Count Romanzoff spoke freely to him, Mr. Adams, upon the whole, seems to have been singularly ill informed of what was going on around him. Not only was he extremely ignorant regarding the disputes that led to the invasion of Russia, but even respecting the events of the invasion itself he obtained no precise knowledge. The truth is that, in accordance with the settled but mistaken policy of the American Government, his allowances were so small as to prevent him from being able to obtain valuable information. Indeed so meagre was his salary that he was not in a position to follow the example of the other Ministers, and leave St. Petersburg for a part of the year. On one occasion the Czar, in his daily constitutional walk, having met the American historian, asked him plainly why he remained in the city; was it because of the narrowness of his means? Mr. Adams frankly answered "Yes." Upon which the Czar commended him for his prudent thrift. But if a diplomatic representative is of any value to a nation, the wisdom of the policy may well be doubted which compels him to have recourse to such economies.

Although France has now no possessions on the North American continent, there was a time when she claimed a territory vaster even than our own, and when her power appeared so formidable as to make it seem for a while doubtful whether she or England would have the privilege of giving to the continent a population, language, religion, and laws. The Seven Years' War settled the doubt. But the struggle was maintained so obstinately,

* *Memoirs of John Quincy Adams*. Edited by Charles Francis Adams. Vol. II. Philadelphia: Lippincott & Co. London: Trübner & Co.

and gave occasion for the display of so much courage and ability by the beaten and the victorious party alike, as to render its history even yet full of interest for English readers. There is another circumstance, too, which throws a retrospective interest over the American contest of France and England. It is now easy to see that the struggle which had its termination on the Heights of Abraham had a further consequence than deciding that the North American Continent was to be English in race, language, creed, and institutions. It prepared the way for the separation of the colonies from the mother-country. Whether the Government of George III. would have put forward the pretension to tax the colonists without representation, had France remained mistress on the St. Lawrence and the Mississippi, may be doubted. But in any case it is certain that the colonists would not have been so ready to repel the pretension with arms. With a great Power, alien in blood, religion, and polity, on their northern and western frontiers, they would have felt too keenly the need of English protection to incur by insurrection the risk of passing under Popish and absolutist sway. Had France not been expelled from the continent by English valour and statesmanship, it may be assumed that the Declaration of Independence would not have taken place when it did. Viewed in this light it was the conquest of Canada which made possible the meeting of the Continental Congress, and the revolutionary war. But, formidable as the power of France seemed at one time, in reality it carried in its bosom the seeds of its own decay. This point Mr. Parkman's history * makes abundantly plain. The French settlements in America were doomed from the first by vices similar to those which have blighted the fair promise of the magnificent Spanish colonies. Whereas Englishmen emigrated to the New World to better their fortunes or to escape from oppression at home, and were left to manage their own affairs with the least possible interference by the authorities in England, the French settlements were founded with a definite governmental and ecclesiastical purpose, and the intervention of the King and his Ministers was minute and incessant. In short, Canada was colonized quite as much to counterbalance the religion as the power of England on the other side of the Atlantic. And hence it had from the outset not only a missionary character, but it was fatally subject to Jesuit influences, and its settlers were recruited too exclusively from those who were filled with a spirit akin to that of the Crusaders. Further, the settlers carried with them those feudal institutions which by their oppressive exactions and unjust exemptions had reduced the peasantry of the mother-country to a state of chronic starvation. Obviously a colony so constituted could not permanently prosper, though, while religious enthusiasm continued fresh, it would naturally be rich in heroism as well as in imaginary miracles. Of the heroism displayed in the early days of the colony, when the whole number of the settlers amounted to but a few thousands, against the wily and hostile savages by whom they were surrounded, Mr. Parkman gives many striking instances in the fourth part of his History, which now lies before us; not the least remarkable being the defence, by seventeen Frenchmen and five friendly Indians, for eight whole days against seven hundred warriors, of an extemporized fort protected only by a picket fence. But the heroism was not more brilliant than the superstition was grovelling. Neither victory nor defeat occurred without its miracle.

In 1852, while the gold fever was at its highest in California, Captain Scammon of the United States Revenue Marine, who happened to be on the coast of that State, found himself compelled to choose between abandoning the sea altogether and taking command of a brig bound on a whaling expedition. In the true spirit of a sailor he chose the latter alternative, and, being a man of reflective turn of mind and strong powers of observation, he availed himself of the opportunity thus afforded to study the habits of the animals in whose pursuit he was engaged. The task he set himself was by no means so easy as it may appear to persons having no practical knowledge of the matter. On the contrary, Captain Scammon states, as the result of his own experience, that close observation for months and even for years may be required before a single new fact regarding the habits of whales or seals can be obtained. Even to delineate accurately the forms of the larger cetaceans is extremely difficult, for usually only a small section of the middle part of the animal is above the water, and, when decomposition causes the body to rise, it has become quite distorted in shape. A consideration of facts such as these will explain how it is that so little has been contributed to the natural history of mammals by practical whalers. Captain Scammon, however, after years of observation and inquiry, has been able to collect a considerable body of information respecting the habits of those animals, which he imparts in a plain and popular style, using technical terms very sparingly; and he has increased the value of his work † by adding to it a history of the American whale fishery.

The fact that President Woolsey's treatise on International Law ‡ has already reached a fourth edition may be taken as evidence of the increasing attention now paid to the subject of which it treats

by all who lay claim to a liberal education in the United States. Certainly the long controversy maintained with this country in regard to the recognition of Confederate belligerency and the depredations of the *Alabama* and its sister cruisers proves that no people stands more in need of enlightenment on the subject. The first edition of President Woolsey's work appeared in 1860, the second, considerably enlarged, four years later, and the third, with further valuable additions, in 1871. The fourth edition which now appears likewise contains various additions. The work is intended for students rather than lawyers, the author having undertaken its preparation while lecturing on international law and history at Yale College. To the original historical sketch of the subject, corrected and enlarged, Dr. Woolsey has added, in the form of a second appendix, a pretty full summary of the various treaties which form the landmarks of international jurisprudence, and in the notes newly introduced he has brought down the discussion to the present time.

Mr. Shepherd's "English Language" § contains the substance of lectures delivered by him at the Baltimore City College during the past three years, and is put forward as a handbook for the students of English philology. Its design is to trace in the light of the latest researches the growth and formation of our mother tongue, and the influences that have affected its development.

The leading place which questions of education now occupy in the minds of thoughtful men on both sides of the Atlantic is very clearly shown by the number of books on the subject which are being constantly issued from the press. Some of these books, indeed, have little to recommend them save the desire of the writers to contribute their share to the common fund of discussion. But all bear testimony to the interest which the subject is exciting. Others of the books, again, though having little value in the way of educational suggestion, are yet instructive as throwing light on the special educational problems which particular countries have to solve. Here, for example, is a work by the Secretary of the Connecticut Board of Education, which, under the title of *Education Abroad* †, is an attempt to dissuade American parents from sending their children to Europe, and more particularly to Germany, for instruction. The author is of opinion that Americans educated abroad are less fitted for participation in American life, whether public or commercial, than those trained at home. He further tells us that young Americans return from Germany with political notions not at all adapted to the institutions of the United States. To this, which is the main purpose of the work, Dr. Northrop adds some papers in advocacy of a universal law of compulsory attendance at school.

Another work of this class is that of Mr. Quick on *Educational Reformers* ‡. The author is an Englishman, his preface being dated from Ingatesstone, in Essex, so long ago as May 1868. Whether the work is merely an American reprint, or now appears for the first time on the other side of the Atlantic, there is nothing to show.

German University Life § is partly a translation and partly a compendium of a portion of Professor Steffans's autobiographical work, *Was ich erlebte*, which was published at Breslau some years since. Professor Steffans was born in Norway, but while he was still a child his parents removed to Copenhagen. He studied at the Universities of that city and of Kiel, and at the age of twenty-five, provided with a travelling pension from the Danish Treasury, he entered Germany, which thenceforward became his home. In old age he composed the autobiographical work to which we have referred. It is diffuse and garrulous to wearisomeness, filling not less than ten thick volumes, yet it contains much that is rare and valuable in illustration of the mental life of the German Universities of his day. To preserve this part, while rejecting what is worthless, has been the object which Mr. Gage set himself. By translating selections from the seven last volumes, he presents us with a portrait gallery of such men as Goethe, Schiller, Schelling, Schleiermacher, Fichte, Novalis, Schlegel, Neander, and others.

Among the signs of the increasing extent to which Americans travel in Europe may be noted the annual publication of a guide-book of Europe ¶ specially designed for them. Numerous as are the European guide-books of European travel, it appears that none of them are exactly adapted to the requirements of the American tourist. Such at least is the opinion of Messrs. Lippincott. Accordingly they prepare and publish annually an American guide-book, which in a single handy volume contains all the information that the ordinary American tourist is supposed to require.

Mr. Gilman's *First Steps in General History* ¶ is an introduction to the study of history intended for the young, and is planned on the principle of attempting to stimulate the student to investigate for himself, and, instead of pretending to supply him with the information he requires, to indicate the path he ought to pursue.

* *The History of the English Language*. By H. E. Shepherd. New York: Hale & Son. London: Trübner & Co.

† *Education Abroad*. By R. G. Northrop, LL.D. New York and Chicago: Barnes & Co. London: Trübner & Co.

‡ *Essays on Educational Reformers*. By R. H. Quick. Cincinnati: Clarke & Co. London: Trübner & Co.

§ *German University Life*. By H. Steffans. Translated by W. L. Gage. Philadelphia: Lippincott & Co. London: Trübner & Co.

¶ *American Guide to Europe*. Philadelphia and New York: Lippincott & Co. London: Cook & Son, &c.

¶ *First Steps in General History*. By A. Gilman. New York: Hurd & Houghton. Cambridge: The Riverside Press. London: Trübner & Co.

* *France and England in North America*. By Francis Parkman. Part IV. Boston: Little, Brown, & Co. London: Sampson Low & Co.

† *The Marine Mammals of the North-Western Coast of North America*. By Charles M. Scammon, Captain U.S. Revenue Marine. San Francisco: Carmany & Co. New York: Putnam's Sons. London: Sampson Low & Co.

‡ *Introduction to the Study of International Law*. By Theodore D. Woolsey. Fourth Edition. London: Stevens & Haynes. New York: Scribner & Co.

*Under the Trees** is a collection of brief essays without any particular merit. The writer, we are told, yields to the request of others in publishing them. Had he been less complaisant the reading public would have suffered no loss.

Of *The Lost Model*†, a romance, we have to speak in somewhat similar terms. It is neither better nor worse than the ordinary run of circulating library novels, and though it may do well enough to pass the heavy hours of idle triflers, it will hardly enchain the attention of those who are not at a loss to kill time.
